Findings of the Chesapeake Bay Study regarding future conditions of the region's land resources are presented. The study, coordinated with all Federal, State, and local agencies having interests in the Bay, includes the multi-disciplinary fields of engineering and the social, physical, and biological sciences. The study area was comprised of: The State of Delaware; Maryland excluding Frederick, Washington, Allegany, and Garrett counties; the Coastal Zone of Virginia; and Washington, D.C. Existing land use mapping was developed from U.S. Geological Survey maps, and future land use was projected and mapped by using county and regional comprehensive plans produced by local and regional planning agencies. The most current available data on water-related land resources of agriculture, forestry, and minerals were used to assess the present status of each land resource, project the future conditions of each, and determine the future problem areas of each resource. Future water resource needs and problem areas are projected to the year 2020. Recommendations for future studies and model testing required for developing a comprehensive management program for the Bay are included. (Davison-IPA)

CHESAPEAKE BAY FUTURE CONDITIONS REPORT, VOLUME 12, APPENDIX 16: HYDRAULIC MODEL TESTING,
Army Engineer District, Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A052 482, Price codes: A05 in paper copy, A01 in microfiche. (1977), 72 p, 3 fig, 3 tab, 2 append.

Descriptors: *Chesapeake Bay, *Hydraulic models, *Model studies, *Hydraulic similitude, Research and development, Prototype tests, Tributaries, Physical properties, Salinity, Temperature, Elevation, Currents(Water), Velocity, Sea level, Sediments, Inflow, Freshwater, Baltimore Harbor, Estaurine environment.

The formulation of a first year hydraulic studies program for the Chesapeake Bay Hydraulic Model is reported. The hydraulic model of Chesapeake Bay provides a means of reproducing many natural events and man-made changes on a manageable scale, so that the necessary data may be collected to assess the results of these happenings. The model, located at Matapeake, Maryland, is a fixed bed geometrically distorted scale model hand molded in concrete; its nine acre area encompasses the Bay proper, all its tributaries up to the head of tidal effects, and the adjacent overbank areas to the contour of 20 ft above mean sea level. The model is expected to reproduce physical prototype data for the following: water surface elevation, salinity, current velocity, dye concentration from dye dispersion tests, temperature, and sediment distribution. The tests selected for the first year of testing were (1) Low Freshwater Inflow Study; (2) Baltimore Harbor Channel Enlargement Study, and (3) Combined Potomac Estuary Water Supply and Waste Water Dispersion Study. Other problems considered for inclusion in the first year studies program, and a priority ranking of the problems based on their economic, environmental and social impacts are discussed. The costs for operation and maintenance of the model complex during the performance of the three studies, estimated on the basis of October 19, 1976 prices, are $2,150,000. (Davison-IPA)

THE PREDICTABILITY OF RAIN AND THE FORAGING PATTERNS OF THE RED KANGAROO (MEGALEIA RUFA) IN CENTRAL AUSTRALIA,
Michigan Univ., Ann Arbor. School of Natural Resources.
B. S. Low.
Journal of Arid Environments, Vol. 2, No. 1, p 61-76, March 1979, 5 tab, 4 fig, 50 ref.

Descriptors: *Animal populations, *Animal behavior, *Food habits, *Kangaroos, *Rainfall disposition, Vegetation effects, Distribution patterns, Population dispersion, Density, Balance of nature, Environmental effects, Succession, Predation, Wildlife management, Seasonal, Australia, Forages, Biological communities, Forecasting.

Because the fate of desert animals is of increasing concern throughout the civilized world, studies of the adaptation mechanisms of desert wildlife to conditions of aridity are important in long-term efforts to preserve species most subject to man's predation. This particular investigation of the habitat of the red kangaroo (Megaleia rufa) in Australia's central desert considered how the amount, variation, and predictability of rainfall affected the density and dispersion of feeding kangaroos, and how these effects interacted with other parameters such as the vegetative composition of the community, season, available free water, and cover. Rainfall was measured weekly by 20 gages and soil moisture computed by .8 km square quadrats. Aerial surveys were flown three times per month to determine kangaroo density and dispersion patterns. Results indicate that both community type and season significantly influenced density, but only community type greatly affected feeding. No evidence could be found that long-term differences in rainfall levels affected densities, and water availability appeared to have no affect on feeding dispersion. The importance of community types ap-

pears to be related primarily to predation pressure, a factor now considered of increasing importance in wildlife management practices. (Tickes-Arizona)

THE MORPHOGENESIS OF IRANIAN CITIES,
Arizona Univ., Tucson. Dept. of Oriental Studies.
M. E. Bonine.
Annals of the Association of American Geographers, Vol. 69, No. 2, p 208-224, June 1979. 16 fig, 1 tab, 56 ref.

Descriptors: *Iran, *Regional development, *Urban hydrology, *City planning, *Distribution systems, *Irrigation canals, Planning, Regional analysis, Water resources development, Networks, Urban mapping, Community development, Drainage systems, Institutions, Institutional constraints, History, Irrigation systems, Open channels, Water conveyance.

It is this author's belief that in Iran an orthogonal network of streets exists in traditional Iranian cities which do not conform to a maze of irregular lanes built around rectangular religious building to facilitate maximum seasonal use but rather are the result of building to accomommodate irrigation systems. The development of grid systems of main streets are described and illustrated in several Iranian cities which were constructed during the pre-industrial Iranian economy and rationally established in conjunction with systems of channels used to irrigate agricultural land. Accordingly, the orientation of the resulting orthogonal networks was determined by the need to arrange the rectangular fields and orchards to the slope of the land, and future housing construction was governed by the pre-existing system of fields and passageways. Irrigation and agricultural practices, then, have played an overriding role in the establishment of the morphology of traditional Iranian cities and expansion has been along existing streets and water channels. 7. RESOURCES DATA

7A. Network Design

UTILIZATION AND INTERPRETATION OF HYDROLOGIC DATA WITH SELECTED EXAMPLES FROM NEW HAMPSHIRE,
New Hampshire Univ., Durham. Water Resource Research Center.
F. R. Hall, and S. L. Dingman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-295 393, Price codes: A06 in paper copy, A01 in microfiche. Research Report No. 20, 1979. 92 p, 20 fig, 11 tab, 29 ref. OWRT A-040-NH (2), 14-31-0001-4029.

Descriptors: *Hydrologic data, *Flow-duration curves, Data analysis, *Regression analysis, Flow rates, Streamflow, Statistical methods, Flood frequency, Low flows, New Hampshire.

The modern emphasis on comprehensive planning and environmental studies has created a increasing demand for the interpretation and utilization of hydrologic data. A potential user of such data is faced with at least three kinds of problems: (1) Availability of data and adequacy of data collection programs; (2) What to do with the data that are available; and (3) How to transfer available data from a collection site to an unmeasured location of interest. This report focuses on interpretation and utilization of available data. The examples are drawn from streamflow records. The general plan of the report is to give examples of various ways of manipulating and interpreting streamflow data. First, there is a discussion of data sources and useful works available in the hydrology literature. This is followed by a section which deals with the basic elements of frequency analysis. Then there is a more detailed description of how to synthesize flow duration curves for ungaged areas. This is followed by a section which has an application of a regional flood analysis, mainly by graphical methods. The report is concluded with selected examples of the use of regression analysis.

NONPOINT SOURCE SAMPLING DESIGN REPORT AREAWIDE WASTE TREATMENT MANAGEMENT PLAN FOR THE GREATER HOUSTON AREA.
Dannenbaum Engineering Corp., Houston, TX.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 758, Price codes: A06 in paper copy, A01 in microfiche. Final Report, 1977. 113 p, 27 tab, 3 ref, 3 append.

Descriptors: Texas, Cities, *Water pollution sources, *On-site data collections, *Data storage and retrieval, Water quality, *Monitoring, Land use, Watersheds(Basins).

A procedure was developed for the establishment of a sampling program and resulting data base for the characterization of non-point sources of water pollution within the Greater Houston 208 planning area. Currently active water quality monitoring programs were reviewed and found to yield insufficient data on non-point sources due primarily to the nonhomogeneousness of the upstream contributory watersheds. Only intensive, event-type sampling can be effective in non-point pollutant identification and quantification. Also, the development of acceptable land use water quality relationships is necessary. SNOW SURVEY AND VEGETATION GROWTH IN THE SWISS ALPS,
Zurich Univ. (Switzerland). Dept. of Geography.
H. Haefner.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-25626, Price codes: A03 in paper copy, A01 in microfiche. Final Report of Swiss EREP-Project No. 323, December 1975. 38 p, 18 fig, 5 ref.

Descriptors: *Remote sensing, *Snow cover, *Vegetation, Satellites(Artificial), Data processing, Snow, Snow surveys, Analytical techniques, Mapping, Classification, Mountains, Alpine, *Swiss Alps, *Switzerland.

Analog processing of S-190-A and B color and IR-color transparencies showed that it is possible to evaluate the courses of the temporary snow line and the upper limit of vegetation growth over large areas. By transferring the results from S-190-A onto a topo-map 1:200,000, an accuracy of + or - 50 m could be achieved. With S-190-B transferred onto a map 1:100,000, an accuracy of + or - 20 m was reached. A compilation of the altitudinal position of these boundaries in different regions, exposures, etc. showed very significant variations for a specific date (September 11, 1973). The upper limit of vegetation growth oscillates between 2,000 and 3,100 m, while the difference between upper boundary of vegetation growth and snow line varies from 450 to 900 m. No comparative synoptic regional data of such kind was available until now. Digital processing of S-192 multispectral data allowed a separation of snow and clouds by combining the information from channels 9 (0.78 - 0.88 micrometer), 15 (1.55 - 1.75 micrometer) and 18 (0.46 - 0.51 micrometer). The developed processing sequence included preprocessing steps, feature extraction, and data output in form of a maplike image of a selected scale with a photomation system. The classification procedure is supervised, based on euclidean distances. (Sims-ISWS)

INORGANIC POLLUTION IN WATER--THE ANALYST'S VIEWPOINT,
Geological Survey, Denver, CO. Water Resources Div.
M. W. Skougstad, and M. J. Fishman.
Toxicological and Environmental Chemistry Reviews, Vol. 2, p 219-236, 1978. 7 fig, 7 tab.

Descriptors: *Water pollution, *Inorganic compounds. *Water analysis, *Chemical analysis, *Analytical techniques, Instrumentation, Laboratory tests, Trace elements, Heavy metals, *Data reliability, *Standard reference water samples.

Inorganic pollution comprises both major and minor constituents, although only 12 chemical elements may be considered major components. Twenty-eight elements constitute a group of common minor elements and an additional 13 elements comprise a group of less common minor constituents. Reliable quantitative data are required on the occurrence of these substances in a wide variety of water types, usually at extremely low concentrations. The analysis of standard reference water samples provides information on the overall reliability of water-quality data. Although most major constituents may be determined with acceptable reliability, determinations of certain minor constituents lack comparable precision; for example, determinations of boron, nickel, and chromium. Few precision data are available on the determination of the less common trace elements. Several comparatively new analytical techniques, such as flameless atomic absorption spectrophotometry, voltammetry, and emission spectroscopy with plasma excitation, appear capable of providing improved sensitivity. (Woodard-USGS)

ON THE APPROXIMATION OF SATURATION VAPOR PRESSURE,
Geological Survey, Tacoma, WA. Water Resources Div.
L. A. Rasmussen.
Journal of Applied Meteorology, Vol 17, No 10, p 1564-1565, October 1978. 1 tab, 4 ref.

Descriptors: *Vapor pressure, *Saturation, *Thermal properties, *Meteorology, *Model studies, Analytical techniques, Numerical analysis, Atmospheric physics, Equations, Evaluation.

The saturation vapor pressure of water vapor in the atmosphere is an important variable in many meteorological processes. Numerical approximation of the dependence of this variable on temperature is necessary in the modeling of these processes. Given here are the coefficients of eight approximating functions, five polynomials and three rational functions, for the saturation pressure with respect to a liquid water surface for the temperature intervals (-50C, +50C) and (0C, +50C), and with respect to an ice surface for the interval (-50C, 0C). Considering both the required computation time and the resulting error, these functions compare favorably with others published recently. (Woodard-USGS)

SATELLITE SURVEILLANCE OF PHYSICAL WATER-QUALITY CHARACTERISTICS,
Geological Survey, Sioux Falls, SD. Water Resources Div.
G. K. Moore.
In: Proceedings of the Twelfth International Symposium on Remote Sensing of Environment, Ann Arbor, Michigan, April 20-26, 1978, p 445-462, 1978. 10 fig, 2 tab, 15 ref.

Descriptors: *Remote sensing, *Surface waters, *Turbidity, *Color, *Satellites(Artificial), Infrared radiation, Solar radiation, Atmosphere, Light penetration, Particle size, Suspended load, Bottom-reflected light, Spectroscopy, *Landsat images, *Solar flux, *Energy backscatter, Specular reflection.

Remote sensing instruments obtain an optical measure of water color and turbidity. Color increases the absorption of light in water and decreases the remote signal; turbidity increases the backscatter of light. Satellite surveillance of water turbidity presently is evaluated as a costly way of obtaining information, but several potential applications may be economical. These include the use of turbidity as an index to streamflow velocity and to the productivity of lakes, estuaries, and oceanic fishing grounds. (Woodard-USGS)

PRACTICAL METHODS OF AIMING ANTENNAS AT GEOSTATIONARY SATELLITES,
Department of Fisheries and Environment, Ottawa (Ontario). Inland Waters Directorate.
L. A. Reid.
Technical Bulletin No 104, 1978, 10 p, 7 fig, 4 ref.

Descriptors: *Satellites(Artificial), *Data transmission, *Data collections, *Hydrometry, *Geostationary Operational Environmental System(GOES), *Antennas, Hydrometeorology, Sensors.

The procedure for aligning Data Collection Platform (DCP) antennas in the Geostationary Operational Environmental Satellite (GOES) System is presented. A method is given for determining (a) the angle of elevation and (b) the azimuth or bearing, to which an antenna must be set to bring it in line with a satellite. Two detailed methods, one using a compass and the other a watch, are presented for setting an antenna on the predetermined bearing. (WATDOC)

STREAM NETWORK ANALYSIS AND GEOMORPHIC FLOOD PLAIN MAPPING FROM ORBITAL AND SUBORBITAL REMOTE SENSING IMAGERY APPLICATION TO FLOOD HAZARD STUDIES IN CENTRAL TEXAS,
Texas Univ. at Austin. Dept. of Geological Sciences.
V. R. Baker, R. K. Holz, S. D. Hulke, P. C. Patton, and M. M. Penteado.
Available from the National Technical Information Service, Springfield, VA 22161 as N75-30620, Price codes: A09 in paper copy, A01 in microfiche. Final Report, EREP No. 064B, April 30, 1975. 196 p, 72 fig, 10 tab, 127 ref. NASA 9-13312.

Descriptors: *Remote sensing, *Floods, *Texas, Satellites(Artificial), Aircraft, Watersheds(Basins), Streams, Drainage, Mapping, Flood peak, Hazards, Topography, Topographic mapping, Geomorphology, Climatology, Hydrology, Skylab.

Flood hazard evaluation can be approached from two viewpoints. An 'upstream' approach would consist of evaluating the interaction of rainfall inputs and physiographic factors in producing flood responses on small watersheds. A 'downstream' approach would map flood hazard zones in the broad alluvial valleys which rivers develop after collecting the flow of numerous tributaries. In this report, an attempt was made to apply remote sensing imagery to both aspects of the flood hazard evaluation problem. This report has two general parts. The first part concerns upstream controls through a discussion of the adjustment of stream network geometry to climatic and geologic factors. The second part of the report concerns downstream flood problems through a discussion of floodplain mapping techniques. (Sims-ISWS)

EFFECT OF HAZARDOUS MATERIAL SPILLS ON BIOLOGICAL TREATMENT PROCESSES,
Environmental Quality Systems, Inc., Rockville, MD.
A. P. Pajak, E. J. Martin, G. A. Brinsko, and E. J. Erny.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 724, Price codes: A10 in paper copy, A01 in microfiche. Report EPA-600/2-77-239, 1977. 200 p, 1 fig, 4 tab, 78 ref.

Descriptors: *Biological treatment, *Activated sludge, *Chemicals, *Water pollution effects, *Industrial wastes, Biodegradation, Waste water treatment, Chemical wastes.

A method has been developed for evaluating the effects of various chemical substances on biological waste water treatment processes. The analysis utilizes a matrix format where more than 250 chemicals are listed alphabetically. Data listed in the matrix for each chemical substance include: a description of the chemical substance; its effect on the treatment process parameters, especially the activated sludge process; and the effects of the treatment process on the chemical substance. Data and results from bench scale, pilot plant, and full scale studies are also supplied. The matrix is arranged in a format that is suitable for its use as an operations handbook. (Lisk-FRC)

CHANGING PATTERNS OF GROUND-WATER USE IN THE UNITED STATES,
NSF Science for Citizens Program, Madison, WI.
A. Zaporozec.
Ground Water, Vol 17, No 2, p 199-204, March-April 1979. 5 fig, 2 tab, 7 ref. NSF OSS 77-23964.

Descriptors: *Water utilization, *United States, *Water resources, *Data collections, Groundwater, Water supply, Rural areas, Irrigation water, Surface waters, Municipal water.

The increasing use of groundwater and its true role as a source of water supplies in the United States have sometimes been interpreted incorrectly. The total use of groundwater has indeed increased tremendously during the last 20 years (by almost 80%), but so has the total use of water (over 70%). And groundwater is still far from being a primary source of water supplies. In 1975, only 20% of the total amount of water withdrawn in the United States for various uses came from groundwater sources. Statistical analysis of groundwater data for the period 1950-1975 has shown that the groundwater usage is changing only very slowly. Relation of groundwater use to total water use expressed in percent was used as an indicator of changes of groundwater use patterns. This percentage has not changed significantly, and it has fluctuated around 19%. In 1975, only 6 states used more groundwater than surface water for their water supplies, and in 23 states groundwater use was less than 10% of total use. Even more unfavorable is the magnitude of change in ratio of groundwater use relative to total water use. From 1955 to 1975, only 13 states show an increase in the ratio. In 28 states the ratio has decreased, and in 7 it has remained the same. (Humphreys-ISWS)

ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN GAINES COUNTY, TEXAS, PROJECTIONS OF SATURATED THICKNESS, VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS,
Texas Dept. of Water Resources, Austin.
A. E. Bell, and S. Morrison.
Report 227, March 1979. 68 p, 18 tab, 72 ref, 24 map.

Descriptors: *Groundwater resources, *Texas, *Aquifers, *Data collections, Groundwater, Maps, Water resources, Aquifer characteristics, Groundwater recharge, Water supply, Groundwater availability, Groundwater mining, Overdraft, Pumping,

Projections, Saturated flow, *Gaines County(TX), *Ogallala aquifer(TX), Pumpage rates, Pumping lifts, Well yields.

This is one numerous planned county studies covering the declining groundwater resource of the Ogallala aquifer in the High Plains of Texas. The report contained maps, charts, and tabulations which reflect estimates of the volume of water storage in the Ogallala aquifer in Gaines County and the projected depletion of this water supply by decade periods through the year 2020. The report also contained estimates of pumpage, pumping lifts, and other data related to current and future water use in the county. However, the report did not attempt to project that portion of the volume of water in underground storage which may be ultimately recoverable. The Ogallala aquifer in Gaines County contained approximately 9.9 million acre-feet of water in 1974. Historical pumpage has exceeded 200,000 acre-feet annually, which is more than twice the rate of natural recharge to the aquifer in the county. This overdraft is expected to continue, ultimately resulting in reduced well yields, reduced acreage irrigated, and reduced agricultural production. There is a very uneven distribution of groundwater in the county. Some areas have ample groundwater resources to support current usage through the year 2000; whereas, in other areas, groundwater is currently in short supply. To obtain maximum benefits from the remaining groundwater resources, water users should implement all possible conservation measures so that the remaining groundwater supply is used in the most prudent manner possible and with the least amount of waste. All available information on production wells used for public water supplies in Morgan and Scott Counties, Illinois, was presented. The definition of public water supply as contained in the Environmental Protection Act of 1970 was used to determine those water systems and wells to be included. The report included separate descriptions for 7 public water supply systems furnishing water to 10 municipalities, 3 state institutions, and 1 water commission. These were preceded by brief summaries of the groundwater geology of the county and the development of groundwater sources for public use. Individual production wells for each supply were described in the order of their construction. The description for each well included the aquifer tapped, date drilled, depth, driller, legal location, elevation in feet above mean sea level, log, construction features, yield, pumping equipment, and chemical analyses. (Humphreys-ISWS)

GROUNDWATER DATA COLLECTION IN THE WATER DATA UNIT,
Her Majesty's Stationery Office, London (England). Archive Section.
M. L. Lees.
Water Services, Vol. 83, No. 997, p 180-185, March, 1979. 4 tab, 10 ref.

Descriptors: *Great Britain, *Data collections, *Groundwater, *Data storage and retrieval, Aquifers, Water levels, Water quality, Hydrographs, Hydrologic data, Weather data, Statistics, Water utilization, Water supply, Computers, Documentation, Publications, Observation wells, Water level recorders.

Statistics on the increasing use of groundwater for public supplies in England and Wales are presented in tabular form. The principal aquifers and their contribution to the total ground water supply are listed. The Chalk, Lower Greensland and the Triassic sandstones are the most important aquifers. In general, the older geologic systems have limited ground water potential. In many areas aquifers may be developed for local supplies. Groundwater data collection using a network of observation wells with automatic water level recorders began after passage of the Water Resources Act of 1963. The Water Data Unit processes the data into a computer and based storage system. The data is published periodically in Ground Water: United Kingdom, Ground Water Year Book, and Water Data. Examples are presented of groundwater hydrographs which are available from the Water Data Unit Archives. Other retrievals are available as printed tables. At present, there is no central system for collecting a digest of chemical and bacteriological analyses of groundwater in England and Wales. If this data is incorporated into the computer-based storage system, compositional maps of groundwater can be produced. (Purdin-NWWA)

GROUND-WATER QUALITY IN BANNOCK, BEAR LAKE, CARIBOU, AND PART OF POWER COUNTIES, SOUTHEASTERN IDAHO,
Geological Survey, Boise, ID. Water Resources Div
H. R. Seitz, and R. F. Norvitch.
Geological Survey Water-Resources Investigations 79-14 (open-file report), February 1979. 53 p, 1 fig, 2 tab, 27 ref.

Descriptors: *Water quality, *Groundwater, Water chemistry, *Groundwater movement, *Geochemistry, Water pollution, Salinity, Aquifers, Water wells, Water analysis, Chemical analysis, Dissolved solids, Nitrogen, Chlorides, Hardness(Water), Well data, Groundwater recharge, Water table, Water treatment, Sampling, Standards, Irrigation water, Idaho, *Bear Lake Valley, *Marsh Valley, *Portneuf Valley, *Gem Valley.

The 103 wells sampled during the study establish a quasi-network that could be resampled in the future to document and analyze changes in ground-water quality in the southeastern Idaho study area. The main aquifers are categorized as alluvium of Quaternary age, basalt of Quaternary and (or) Tertiary age, rocks of the Salt Lake Formation of Tertiary age, and undifferentiated bedrock of pre-Tertiary age. Dissolved solids, hardness, nitrite plus nitrate as nitrogen, and chloride concentrations in the ground waters ranged from 165 to 1,690; 78 to 1,700; 0 to 29; and 1.9 to 360 milligrams per liter, respectively. The areal distributions of these constituents are shown on maps. The range and median values of these same constituents are tabulated by aquifer occurrence. Some of the most mineralized and hardest waters occur in the basalt aquifer near travertine deposits (or terraces), which are composed of calcium carbonate precipitates from mineral springs. For irrigation purposes, all the waters are classified as having low-sodium hazard. Most have medium- to high-salinity hazard. (Woodard-USGS)

WATER-RESOURCES INVESTIGATIONS IN FLORIDA, 1977,
Geological Survey, Tallahassee, FL. Water Resources Div.
Geological Survey Water-Resources Investigations in Florida folder, 1978. 1 sheet.

Descriptors: *Water resources, *Projects, *Florida, *Water quality, Surface waters, Groundwater, Data collections, Sites, Maps, Bibliographies, Publications.

The folder describes past and present water-resources investigations in Florida conducted by the U.S. Geological Survey in cooperation with the Florida Department of Environmental Regulation and other State, municipal, and Federal agencies. Included are: (1) A large map of the State that shows the location of over 425 surface-water sites where streamflow and water-quality data are collected, (2) sites where groundwater-level data are collected, and (3) the location of 48 USGS water-research projects currently under investigation. The folder lists more than 360 water-resources reports and maps. (Woodard-USGS)

WETLAND CLASSIFICATION SYSTEM FOR THE TENNESSEE VALLEY REGION,
Geological Survey, Reston, VA. Water Resources Div.; and Tennessee Valley Authority, Norris, TN. Div. of Forestry, Fisheries, and Wildlife Development.
V. Carter, and J. H. Burbank.
Tennessee Valley Authority Technical Note No. B24, June 1978. 36 p, 14 fig, 2 tab, 29 ref.

Descriptors: *Wetlands, *Classification, *Vegetation, *Methodology, *Tennessee Valley Authority, Hydrologic budget, Management, *Tennessee Valley region.

A wetland classification system for the Tennessee Valley region is described. The wetland classes and subclasses are based on vegetation and frequency and duration of inundation. There are 6 wetland classes and 12 wetland subclasses. This system is compared with other existing classification systems. (Woodard-USGS)

eport No. 8, 1977. 100 p, 33 fig, 5 tab, 19 ref.

escriptors: *Groundwater resources, *Ground-
ater availability, *Water quality, *Aquifer char-
teristics, *Geologic formations, Water wells,
ater yield, Water levels, Hydrogeology,
roundwater movement, Saline water intrusion,
roundwater recharge, Specific capacity, Chemi-
l analysis, Aquifer management, South Carolina,
lorry County, *Georgetown County.

n evaluation of developing water-well and water-
ality problems in the coastal aquifer systems of
orry and Georgetown Counties, S.C., was initiat-
in 1972. Geologic cross sections detail the strati-
aphic relationships of sand, clay, and calcareous
ndstone and also establish formational boundaries
tween Tertiary formations boundaries between
ertiary formations and the Peedee, Black Creek,
d Middendorf Formations. The Black Creek
uifer system is the most satisfactory source of
od-quality water in the two-county area. Usually
e water is soft, low in chloride, and iron- and
lfate-free. However, fluoride concentrations are
cessive, reaching 5.5 milligrams per liter in some
eas. Water in the Peedee Formation and Tertiary
rmations, although low in fluoride and chloride,
ten contains excessive concentrations of iron,
drogen sulfide, and sulfate. Treatment would be
cessary before this water could be considered
r a domestic water supply. Water in the Midden-
rf Formation is salty presumably throughout the
o-county area. A typical value of the hydraulic
nductivity of Black Creek sand beds is 30 feet
r day, but it is less in central and southern
eogetown County. An average value of specific
orage of 0.0000026 per foot has been calculated
om pumping tests throughout the area. (Woo-
rd-USGS)

ROUND-WATER COMPUTER MODELS - IN-
ELLECTUAL TOYS,
H. A. Baski.
Ground Water, Vol. 17, No. 2, p 177-179, March-April, 1979.

Descriptors: *Computer models, *Hydrogeology, *Projections, Computer programs, Ground water, Aquifer characteristics, Model studies, Basic data collections.

Misuse of ground water computer models through misapplication, oversell, and questionable methods may destroy confidence in them both outside and within the ground water profession. Ground water computer models can be useful tools for making projections using aquifer and confining bed characteristics as input. For short-term projections, transmissivity is the key item. However, for long-term projections recharge and storage coefficient become more important. The degree of uncertainty in the input will determine the accuracy of the output. Other types of models that can be used for projections include flow nets, well formulas, heat flow formulas, and extrapolations. Regardless, of what model is used, the collection and interpretation of good basic data is of the utmost importance for accurate projections. (Purdin-NWWA)

GROUND-WATER COMPUTER MODELS - PRACTICAL TOOLS,
Wright Water Engineers, Inc., Denver, CO. Ground Water Div.
R. E. Darr.
Ground Water, Vol. 17, No. 2, p 174-175, March-April, 1979. 9 ref.

Descriptors: *Groundwater, *Computer models, *Water management(Applied), *Hydrogeology, Computer programs, Computers, Wellfields, Conjunctive use, Solutes, Statistical models, Calculators.

Models that can be programmed on computers or hand-held calculators are valuable and practical tools for the ground water manager in solving complex problems for wellfields, conjunctive use, solute transport, and statistics. The digital computer, the analog, and hybrid computers have been used very effectively for hydrogeologic models. A valid model must conform to the law of mass balance (i.e., the water in must equal the water out plus the water stored) and Darcy's Law. Computer models are most useful where there is a lack of data and a quick approximation is needed. They vary in complexity and cost depending on the type of problem and the degree of accuracy required. The practicality of such models and their results is a function of the intelligence of the user. Models are only time-saving tools which require data collection, practical human experience, judgment evaluations and common sense to program and interpret. (Purdin-NWWA)

DATA MANAGEMENT SYSTEM (DMS) FOR TIME SERIES,
Hydrocomp Inc., Palo Alto, CA.
J. J. Heler.
Transactions of the ASAE, Vol. 22, No. 1, p 122-125, Jan.-Feb. 1979. 5 fig.

Descriptors: *Data management, *Time series, Hydrologic data, Meteorological data, Data organization, Data compression, System mode, System operation, Capabilities, Systems analysis, Computer programs.

Agencies which collect hydrometeorological or related information find that the volume of data increases rapidly. Also, new techniques in hydrologic and water quality analysis are being developed, and these require more kinds of data and create greater problems in management. Modern analytical methods are computer based; thus it is desirable to have a data retrieval system within the same software to allow direct transfer of information. Hydrocomp Inc. has developed a data management system as part of the modernization and improvement of its analysis tools. This system is a component of a new release of Hydrocomp simulation software called Hydrocomp Simulation Processor II (HSPII). This paper describes Data Management System (DMS) capabilities. In addition to storing and retrieving a considerable amount of information collected as time series, the system can be used to perform a variety of analyses on transformations of these data and print out in tabular or graphical form the original data series or its transformation. DMS is suitable to a wide variety of applications; it can store and process any data collected as a sequence in time. It is a useful analytical tool presented for agencies who are considering a conversion to modern computer-based data management. (Bell Graf-Cornell)

SEWER SYSTEM EVALUATION, REHABILITATION AND NEW CONSTRUCTION A MANUAL OF PRACTICE,
American Public Works Association, Chicago, IL.
R. H. Sullivan, M. M. Cohn, T. J. Clark, W. Thompson, and J. Zaffle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 248, Price codes: A09 in paper copy, A01 in microfiche. Report EPA-600/2-77-017d, 1977. 117 p, 23 fig, 13 tab, 4 ref, 6 append.

Descriptors: *Infiltration, *Sewers, *Sewerage, Design, *Evaluation, Inspection, *Rehabilitation, Costs, Waste water, Design standards.

This manual discusses three areas of infiltration/inflow of sewer systems: sewer system evaluation, sewer rehabilitation, and design of new systems to minimize infiltration/inflow. Procedures for conducting the System Analysis and Sewer System Evaluation (SSES) by local authorities and consulting engineers are described in detail. Methods of sewer inspection and sewer cleaning equipment are discussed, and cost factors are given. Rehabilitation techniques are described. Establishment of infiltration limits for new sewer construction is recommended at a rate not to exceed 20 gal/inch diameter/mile/day. Testing for infiltration limits is described. (Small-FIRL)

SUBSURFACE WASTE-HEAT STORAGE: EXPERIMENTAL STUDY,
Auburn Univ., AL. Water Resources Research Inst.
J. C. Warman, F. J. Molz, and T. E. Jones.
Available from the National Technical Information Service, Springfield, VA 22161 as ORO-5003-1, Price codes: A02 in paper copy, A01 in microfiche. Final Report No. ORO/5003-1, June 30, 1977. 67 p, 7 fig, 1 tab, 23 ref, 1 append. E-(40-1)-5003.

Descriptors: *Waste storage, *Heat, *Injection wells, Hydraulics, Heat transfer, Instrumentation, On-site investigations, On-site tests, Wells, Well data, Well spacing, Drilling, Pumping, Porosity, Thermal conductivity, Porous media, Porosity, Water utilization.

Confined aquifers are used as storage reservoirs for moderate to high temperature water in proposed electrical power plant and solar heating systems. An experimental program was undertaken to test the heat storage well concept and to provide data for the calibration of mathematical models. The experimental program was in four phases. In Phase I an exploratory well was drilled at the selected field site. Construction of the central injection well and three observation wells took place during Phase II as well as preliminary pumping tests. During Phase III the remainder of the observation well field was constructed, final pumping tests were performed, and the measurement of aquifer thermal properties were taken. Phase IV involved a cycle of warm water injection, storage and recovery. It is concluded that: heat storage aquifers need low natural pore velocities; require the use of heated water with low suspended solids, or clog-

ging will become a serious problem; the swelling of clays must be minimized; hydraulic pressures capable of breaching the confining layers must be avoided; and the use of formation water as influent to the heating system may minimize clogging problems. The calculated energy recovery factor of 0.68 on storage of two million gallons for 36 days was considered promising. (Davison-IPA)

TRANSIENT SEEPAGE ANALYSIS OF GURI DAM,
Harza Engineering Co., Chicago, IL. Hydrology Analysis and Design Div.
C-Y. Wei, and W. Y. J. Shieh.
Journal of the Technical Councils, American Society of Civil Engineers, Vol 105, No TCI, Proceedings Paper 14503, p 135-147, April 1979. 8 fig, 1 tab, 14 ref, 1 append.

Descriptors: *Dams, *South America, *Earth dams, *Seepage, *Model studies, Mathematical models, Finite element analysis, Soil water, Hydraulic conductivity, Porous media, Soil water movement, Saturated soils, Pore water, Pore pressure, Reservoirs, Dam design, *Venezuela, *Guri Dam(Venezuela).

The transient seepage analysis of the 95-m high Guri earthfill dam was undertaken to investigate the saturation of earthfill and foundation during and after staged reservoir filling. Saturated-unsaturated porous media flow theory and Galerkin-type finite element techniques were applied. The phreatic surfaces were treated as zero pore pressure lines. The zero pore pressure line was obtained from the calculated pore pressures, including negative pressures in partially saturated zones. The movements of the saturation (wetting) fronts and the pore pressure distributions in the earthfill and its foundation were used in the investigation of deformation and stability of the Guri earthfill dam under staged construction and reservoir filling. (Sims-ISWS)

BOTSWANA AND MALAWI RURAL WATER SUPPLIE.
Water Services, Vol. 82, No. 993, p 784, 786, November, 1978.

Descriptors: *Botswana, *Malawi, *Water supply development, Africa, *Rural areas, Diseases, Water distribution, Pipelines, Groundwater, Water wells.

About 80% of human and livestock water requirements in Botswana depend on ground water supplies. Under the British Aid Programme, 65,000 villagers will obtain water piped from existing wells. 30% of the wells were in need of maintenance and rehabilitation before pipelaying could begin. This water distribution system not only will reduce the spread of water-borne diseases through contaminated drinking water, but will save time and energy in carrying water that could be spent better in growing vegetables. The Malawi rural water supply project brings similar benefits but differs from the Botswana project in two ways. First, the water supply is gravity-fed from mountain streams and lakes. Secondly, the construction of the system is done entirely by groups of villagers. Local village leaders are taught to maintain the pipes, storage tanks, etc. (Purdin-NWWA)

EVALUATION OF TRENCHLESS SEWER CONSTRUCTION AT SOUTH BETHANY BEACH, DELAWARE,
Richardson (Edward H.) Associates, Inc., Newark, DE
L. J. Beetschen, and W. C. Henry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 776, Price codes: A05 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-022, March 1978. 94 p, 35 fig, 20 tab. S-800690.

Descriptors: *Sewers, *Construction, *Construction costs, *Construction materials, *Construction joints, Soil types, Water table, Cost comparisons, Trenches, Installation costs, Construction costs, Pipes, Pipelines.

A trenchless method of sewer construction was compared with conventional construction methods under similar site conditions. Cost comparisons were made on the basis of contract prices, calculated composite sewer systems, and man-day rate. The trenchless method proved to be more cost effective: 50% on the actual unit bid price; 16% on complete sewer installation including manholes, wyes, laterals; and 23% on labor. The conventional method used eight inch polyvinyl chloride pipe and rubber gasketed joints; the trenchless method used 8-inch polyvinyl chloride solvent welded pipe. Although the trenchless method does not seem suited for urban areas with significant subsurface utilities, or where rock or boulders appear in high density, it is adapted to high water table areas, and its application is flexible over a wide range of varying soil conditions. With proper field control it results in less deflection and horizontal and vertical misalignment; its potential for infiltration is small. This method is safer than the conventional one, because open trenching is reduced to a minimum. It is less disruptive to traffic, and is an improvement in sediment runoff control and noise reduction. (Davison-IPA)

RESIDUAL STRENGTH TEST, PARAITINGA AND PARAIBUNA DAMS, BRAZIL,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Soils and Pavement Lab.
F. C. Townsend, and P. A. Gilbert.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A032 896, Price codes: A03 in paper copy, A01 in microfiche. Miscellaneous Paper S-74-21, June 1974. 30 p, 16 fig, 2 tab, 1 append.

Descriptors: *Shear strength, *Soil properties, *Soil compaction, Laboratory tests, Soil mechanics, Dams, Stress, Foreign countries, Foreign research, Shear, *Paraitinga dam, *Paraibuna dam, *Brazil, Waterways experiment station.

Monotonic residual strength tests were conducted on micaceous material from Paraitinga and Paraibuna dams. The test program consisted of multistage annular shear tests on both loosely and densely compacted specimens from both dams under normal stresses of 1.1, 3.1, and 9.1 kg per sq cm. The test results showed that materials from the two dams are quite similar and can be classified as silty sands. The densities of the block samples from Paraitinga and Paraibuna dams were 88.6 and 92.6% maximum standard density from Harvard miniature compaction tests. (Singh-ISWS)

INVESTIGATION OF PLASTIC PIPE FOR USE BY THE CORPS OF ENGINEERS,
Construction Engineering Research Lab. (Army), Champaign, IL.
A. Smith.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A042 313, Price codes: A03 in paper copy, A01 in microfiche. Technical Report M-219, July 1977. 43 p, 4 fig, 13 tab, 12 ref, 4 append.

Descriptors: *Plastic pipes, *Pressure conduits, *Building codes, *Water hammer, Plumbing, Economics, Corrosion, Data collections, Water supply, Energy consumption, Drain-waste-vent.

This report presented the findings of a study of commercially available plastic pipe used for water distribution, plumbing, drain-waste-vent, and sewage systems. The study included a survey of military and civilian users of plastic pipe to determine acceptance, a review of model building codes and standards, and a testing program involving the making of joints under different conditions. Results of this study indicated that plastic pipe is an acceptable substitute for metallic pipe in many installations. Significant cost savings in both labor and material can be realized by using plastic pipes. The plastic pipes are available in a range of sizes and pressure ratings. Less energy is required in their production, and their corrosion resistance can produce additional cost savings. Good, serviceable joints can be made with proper use of the currently available methods. (Singh-ISWS)

THE ORGANIC DRILLING FLUID CONTROVERSY: PART I,
M. R. Richard.
Water Well Journal, Vol. 33, No. 4, p 66-71, 74, April 1979.

Descriptors: *Water wells, *Drilling fluids, *Water pollution, Bacteria, Polymers, Rotary drilling, Sampling, Public health, Water wells, Disinfection.

A case study is presented of a water well driller who used Revert, an organic polymer drilling fluid. Bacterial contamination of wells drilled with this fluid was noticed after drilling over 50 wells. Efforts to correct the situation met with little success. The driller, unable to meet financial obligations since most of the wells were not approved by the local board of Health, filed bankruptcy and brought suit against the UOP Johnson Division which manufactures Revert. The driller may bear some responsibility for the contamination since he used hole cuttings containing Revert as grouting material, a practice which would tend to favor continued bacterial growth. (See also W79-06898) (Purdin-NWWA)
W79-06897

THE ORGANIC DRILLING FLUID CONTROVERSY: PART II,
M. R. Richard.
Water Well Journal, Vol. 33, No. 5, p. 50-58, May, 1979.

Descriptors: *Water wells, *Drilling, *Drilling fluids, *Polymers, Water pollution, Rotary drilling, Bentonite, Well regulations, Public health, Sampling, Bacteria.

Public health officials and water well drillers discuss their experiences and opinions concerning organic drilling fluids. Several states have regulations concerning their use or are in the process of investigating them. Many problems in organic-drilled wells may result from a driller's unsanitary drilling procedures or failure to follow manufacturer's instructions. Helpful suggestions are provided for safe and effective use of organic drilling fluids. If time and effort are spent on these precautions, organic drilling fluids can be a valuable tool, saving the driller much time and money and resulting in easier development and increased well yields. (See also W79-06897) (Purdin-NWWA)
W79-06898

ECONOMIC ANALYSIS, ROOT CONTROL, AND BACKWATER FLOW CONTROL AS RELATED TO INFILTRATION/INFLOW CONTROL,
American Public Works Association, Chicago, IL.
R. H. Sullivan, R. S. Gemmell, L. A. Schafer, and W. D. Hurst.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 738, Price codes: A06 in paper copy, A01 in microfiche. Final Report No. EPA-600/2-77-017a, December 1977. 110 p, 17 fig, 13 tab, 17 ref. 803151.

Descriptors: *Sewers, *Sanitary sewers, *Economics, *Infiltration, *Inflow, *Root systems, *Gates, Repairing, Maintenance, Rehabilitation, Pipes, Inspection, On-site investigations, Cities, Joints(Connections).

A compilation of needed information for local uthorities and consulting engineers on the control nd elimination of infiltration/inflow (I/I) flows to anitary sewer systems is presented. The present ractices for determining and controlling I/I are dentified and analyzed, and the role of roots and de or backwater gates in the I/I problem is nvestigated. On-site investigations and question-aires revealed that local authorities were just be-inning to consider their I/I problems. It was ound that roots were a major sewer system prob-em. Tide gates, considered satisfactory, generally eceive infrequent maintenance and often do not lose properly. Since it is seldom cost-effective to orrect all points of infiltration and some types of nflow, only major conditions should be corrected efore determining the economics of rehabilitation ersus transport-treatment. Correction of inflow onditions is generally dependent upon the politi-al support of community leadership. Many of the actors important for economic analysis are specif-c to the site, and therefore the sample calculations eveloped herein should be used only as a guide. Vater conservation devices such as flow-reducing hower heads and lavatory fixtures may be cost-ffective when costs for the entire system are onsidered. This study updates a similar effort onducted in 1970. (Davison-IPA)
V79-06952

CONTROL OF SEWER OVERFLOWS BY POLYMER INJECTION,
Dallas Water Utilities Dept., TX.
R. W. Chandler, and W. R. Lewis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 654, Price codes: A09 in paper copy, A01 in microfiche. Report EPA-600/2-77-189, 1977. 169 p, 47 fig, 16 ab, 53 ref, 5 append.

Descriptors: *Sewers, *Overflow, *Polymers, Flow characteristics, *On-site tests, Flow rates, Friction, Performance, Costs.

Certain water soluble chemicals were injected into ewers to reduce turbulent friction. The friction-educing chemicals prevented or limited overflows n a working sewer line when an automatic injec-ion system was used. Three methods of polymer eed control were studied: constant rate, flow pro-portional, and level proportional. Constant rate is he simplest and least expensive and was adequate nder most conditions. Polymer dosages directly rom the dry material were in the range of 15 to 50 ppm. These are lower dosages than previously sed; thus, polymer injection may be more eco-omical than previously believed. Two problems vhich limited the success of the method were nstrumentation failures and polymer lumping. Polymer lumping has been solved by redesigning he polymer feed funnel to incorporate a trap for umps. The two polymer types tested were: Union Carbide Polyox WSR-301 (polyethylene oxide) nd ICI America 4430 (polyacrylamide copo-ymer). Friction reducing properties were similar, ut differences in mixing properties existed. The CI polymer had a wetted specific gravity greater han 1.0, which produced some polymer accumula-ions near the bottom of the mixing tank. In this ase, mechanical agitation would make the injec-ion rate more constant. (Small-FRC)

SEWER INFILTRATION AND INFLOW CONTROL PRODUCT AND EQUIPMENT GUIDE,
American Public Works Association, Chicago, IL.
W. S. Foster, and R. H. Sullivan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 680, Price codes: A05 in paper copy, A01 in microfiche. Report EPA-600/2-77-017C, 1977. 78 p, 50 fig, 7 ref, 1 append.

Descriptors: *Sewerage, *Inflow, *Infiltration, Flow measurement, *Pipes, *Monitoring, Safety, Sanitary engineering, Inspection, Maintenance, Mechanical equipment.

New and existing equipment, materials, and prac-ices available to prevent the infiltration and inflow of water into sewer systems are listed and discussed. Sewer cleaning techniques and equipment needed to help locate points of infiltration and inflow and to improve the accuracy of inflow measurements, are described. A review is presented of the flow-measurement equipment and techniques necessary for the determination of the quantity of infiltration and inflow. Equipment and practices used to inspect sewers and locate entry points of unwanted water are also reviewed. These include closed-circuit television, photographic inspection, low-pressure air testing, and smoke inspection. Current sewer-grouting practices, equipment, and material are discussed with emphasis on acrylamide gel and the elastomeric grouting compound. A review is presented of insertion pipe for rehabilitation, sewer fittings, and a brief discussion of trench backfilling monitored by nuclear soil-density meters. Safety practice, which should be followed when crews undertake control of sewer infiltration and flow, are discussed. (Small-FRC)

TWO-DIMENSIONAL SHALLOW WATER-WAVE MODELS,
Louisville Univ., KY. Dept. of Civil Engineering.
N. Katopodes, and T. Strelkoff.
Journal of Engineering Mechanics Division, American Society of Civil Engineers, Vol 105, No EM2, Proceedings Paper 14532, p 317-334, April 1979. 8 fig, 1 tab, 23 ref, 2 append.

Descriptors: *Waves(Water), *Shallow water, *Flood waves, *Model studies, Mathematical models, Equations, Unsteady flow, Flow, Numerical analysis, Analytical techniques, Hydraulics.

For two-dimensional unsteady flow in shallow water, real characteristic surfaces exist. Their envelope is a quadric conoid, whose curvilinear rays serve as paths for the transmission of information in t-x-y space. The original equations of flow can be reduced along these rays, called bicharacteristics, to equations containing differentiation in one less direction. Simplified numerical methods can be developed, utilizing this property of the equations, that are superior to both finite difference and finite element techniques. Three numerical characteristic networks of varying complexity were tested for accuracy and stability with flow problems that involve both subcritical and supercritical flow. The solution proceeds in specified time intervals by extending the bicharacteristics backwards until they intersect a plane on which the flow conditions can be found by interpolation from known data. The most accurate numerical network was applied to the computation of a highly two-dimensional wave propagating on a dry bed. (Sims-ISWS)

FLOW IN A BEND IN A ROTATING OPEN CHANNEL,
Bergen Univ. (Norway). Geophysical Inst.
G. K. Furns.
Journal of Hydraulic Research, Vol. 17, No. 1, p 15-22, 1979. 5 fig, 3 ref.

Descriptors: *Open channels, *Flow, *Hydraulics, Eddies, Viscosity, Coriolis force, Equations, Mathematical studies, Rotational flow, *Rotating open channel, Rossby number, Secondary flows.

A constant flow down a circular bend in a rotating open channel of rectangular cross-section was considered. By using the eddy viscosity concept combined with a finite slip velocity at the bed, simple analytical solutions of the problem were obtained. They showed a helical motion induced by the combined effects of channel curvature and Coriolis force. For values of the inverse Rossby number close to zero, we have the well known secondary flow away from the center of curvature near the surface and towards it near the bottom. As the inverse Rossby number increases, the secondary flow is strengthened or weakened, depending on the relative direction of rotation of the basic flow. The basic flow also was shown to be strongly influenced by the inverse Rossby number. (Lee-ISWS)

ANNOTATED BIBLIOGRAPHY ON NORTHERN ENVIRONMENTAL ENGINEERING 1976 - 1977,
Department of Fisheries and Environment, Ottawa (Ontario).
B. C. Armstrong, and J. J. Cameron.
Economic and Technical Review Report EPS 3-WP-79-1, January 1979, 132 p.

Descriptors: *Bibliographies, *Environmental engineering, *Water, *Waste water(Pollution), *Air pollution, *Solid wastes, Utilities, *Environmental conditions, *Northern Areas.

To aid individuals concerned with or working on environmental engineering projects in northern areas, the Northern Technology Unit (NTU) has undertaken a program of preparing biennial bibliographies of environmental engineering reports and papers. This publication is the second in the series, the first of which was the 1974-75 edition, published March, 1977 as Environmental Protection Service Report No. EPS-3-WP-77-6. Only reports and papers which are generally available are included in either of these report listings. The NTU will not function as a distribution source for the reports listed in the bibliographies. There are three distinct parts to this document. The first, the annotated bibliography itself, has been arranged alphabetically by first author. The article summaries were either prepared by the NTU or extracted from published abstracts. The second part, the keyword index, is also in alphabetical order and was based on terms commonly used or appearing in similar engineering or environmental bibliographies. Included in the keyword index are special topic keywords relating to water, wastewater, air pollution, solid waste, environmental conditions

and utilities delivery to provide faster access to the references by subject area. The third part of the document is the special bibliography of conferences and other bibliographies which may be of interest to the user. This latter section was not limited to the 1976-77 period. (WATDOC)

8C. Hydraulic Machinery

WATER SYSTEMS BASICS--PART IV.
Ground Water Age, March, 1979. p 17-19, 3 fig, 3 tab.

Descriptors: *Pumps, *Electrical wiring, Jets, Submersibles, Installation.

Selection criteria for water pumps include cost, performance, noise, well depth and other advantages and disadvantages. Shallow-well jet, deep-well jet, and submersible pumps are compared using these criteria. Pump installers should make sure that overload protection is provided and that the wire from the control box to the pump is of adequate size. The size wire needed depends on the power requirements of the pump and the length of the wire run. A lightning arrester should be added if it is not included with the basic pump package. (Purdin-NWWA)
W79-06899

WATER SYSTEMS BASICS--PART V.
Ground Water Age, Vol. 13, No. 8, p 17-19, 36, April, 1979. 2 fig.

Descriptors: *Jets, Installation, Pumps, Shallow wells, Deep wells, Sites, Well data, Pipes, Pumping.

Basic procedures and guidelines for jet pump installation are outlined. The location for the jet pump should be stable, sanitary, protected, and as close to the well as possible. Well capacity and other data should be determined from a well log or pump test. The size of pipes, whether steel or plastic, should never be reduced below the pipe size of the ejector and the pump body. Essential pipe fittings include unions, gate valves, and tees. For shallow wells the maximum suction lift cannot exceed 25 feet. A foot valve prevents water in the suction pipe from flowing back into the well. A well seal is installed at the top of the casing. After surface connections are made the pump must be primed before operating. Deep well jet installation can be a two-pipe or single-pipe system. In the single pipe system, the casing acts as the drive pipe. Air pumping in underproductive wells can be avoided with a tailpipe which decreases the flow as the water level in the well falls. (Purdin-NWWA)

A COMPARISON BETWEEN EXPERIMENTAL AND NUMERICAL INVESTIGATIONS OF THE MOTION OF THE WATER SURFACE IN A MODEL SURGE TANK,
University of Wales Inst. of Science and Technology, Cardiff. Dept. of Civil Engineering.
P. W. France
Advances in Water Resources, Vol. 1, No. 1, p 49-51, September 1977. 3 fig, 4 ref.

Descriptors: *Surge tanks, *Motion, *Water surface, *Behavior, Comparison, Computer programs, Finite difference procedure, Unsteady flow, Equations, Hydroelectricity, Pipelines, Flow rate, Reynolds number

This paper describes an investigation into the motion of the water surface in a simple model surge tank and the relevant factors governing its behavior. The oscillation of the free water surface is an unsteady flow problem which is amenable to a mathematical solution using a finite difference step-by-step integration procedure. For comparison, two such methods are presented: (1) a simple initial value method; and (2) a predictor-corrector technique. Computer programs have been developed linked to a graph plotter to give a visual presentation of the numerical solutions together with the experimental results of the damped oscillation of the water surface in the model surge tank. 8E. Rock Mechanics and Geology

HYDROGEOLOGICAL TESTING ASSOCIATED WITH UNDERGROUND COAL GASIFICATION,
Alberta Research Council, Edmonton. Ground Water Div.
R. I. J. Vogwill.
Canadian Geotechnical Journal, Vol. 16, No. 2, p 59-68, February, 1979. 7 fig, 2 tab, 9 ref.

Descriptors: *Coals, *Aquifer testing, Aquifer characteristics, Permeability, Storage coefficients, Anisotropy, Confined aquifers, Fracture permeability, Canada.

Four aquifer tests were conducted near Forestburg, Alberta to determine aquifer characteristics of a coal seam and surrounding sediment, examine surface-groundwater relationships, and establish whether the permeability of the coal seam was anisotropic. The results of these tests were to aid in the evaluation of the effects of underground coal gasification on the groundwater regime. Two pregasification tests indicated that the coal seam was a confined aquifer with a small storage coefficient and limited, anisotropic permeability that appeared to be unrelated to regional fracture patterns. The influence of this anisotropy on controlling the directions of gasification was not established due to uncertainty about the consistency of coal fracturing. The first post-gasification aquifer test indicated that the groundwater regime had changed somewhat. Groundwater temperatures increased from 6 degrees C to 30 degrees C. Permeability increased and had a more pronounced anistropy. Gasification was thought to have increased the porosity of the coal which resulted in a 20-fold increase in the storage coefficient. Subsequent excavation of the coal confirmed this assumption. The second post-gasification test indicated that fracturing in the coal seam was inconsistent and that major axis of anisotropy and the direction of regional major fracturing coincide. (Purdin-NWWA)

U.N. GROUND WATER PROGRAM.
Water Well Journal, Vol. 33, No. 6, p 68, June, 1979.

Descriptors: *United Nations, *Foreign countries, *Water supply development, Ground water, Projects, Programs, Training, Exploration, Drilling, Governments, Research and development, Water resources development, Geologic formations, Geographic regions.

The U.N. ground water exploration and development program has substantially benefited 57 developing countries by improving rural and urban economies, increasing agricultural production and alleviating water shortages. Current projects include surveys of ground water resources, organization of ground water services, and water resources policy and planning. These projects are designed to satisfy a variety of water supply needs in different geographic and geologic areas. Financial and human resources contributed to the project by the host government are commensurate with the country's economy. Most U.N. projects have included on-the-job training using a variety of drilling rigs, and analytical and surveying equipment. (Purdin-NWWA)

W79-06558 4A

BIODEGRADATION
The Making of Deserts: Climate, Ecology, and Society,
W79-06839 2A

BIOINDICATORS
Evaluation of an Automated Biological Monitoring System at an Industrial Site,
W79-06721 5A

Effect of Upgrading a Municipal Wastewater Effluent on Pollution Indicator and Other Microorganisms in River Water,
W79-06856 5B

Ecological Effects of Urban Stormwater Runoff on Benthic Macroinvertebrates Inhabiting the Green River, Massachusetts,
W79-06917 5C

BIOLOGICAL COMMUNITIES
A Laser-Based Optical Filtering System to Analyze Samples of Diatom Communities,
W79-06720 5A

Seasonal Succession of Phytoplankton in Roosevelt Lake, Arizona,
W79-06845 2H

BIOLOGICAL PROPERTIES
Factors Governing the Biological Productivity, Regime, and Content of Biogenic and Organic Substances in the Sequence of Dnepr Reservoirs,
W79-06614 5B

BIOLOGICAL TREATMENT
Biological Treatment, Effluent Reuse, and Sludge Handling for the Side Leather Tanning Industry,
W79-06865 5D

Effect of Hazardous Material Spills on Biological Treatment Processes,
W79-07000 7B

BIOMONITOR
Evaluation of an Automated Biological Monitoring System at an Industrial Site,
W79-06721 5A

BLEACHING WASTES
Pilot Investigation of Secondary Sludge Dewatering Alternatives,
W79-06948 5D

BOTSWANA
Botswana and Malawi Rural Water Supplie.
W79-06724 8A

BOTTOM SEDIMENTS
Flow Past Bodies in a Turbulent Flow Near a Solid Surface,
W79-06612 2J

Surficial Sediments,
W79-06690 5B

BOUGAINVILLE ISLAND (PAPUA NEW GUINEA)
Estimating Sediment Transport in a Braided Gravel Channel--The Kawerong River, Bougainville, Papua New Guinea,
W79-06618 2J

BOUNDARY LAYERS
Flow Past Bodies in a Turbulent Flow Near a Solid Surface,
W79-06612 2J

BRAIDED CHANNEL
Estimating Sediment Transport in a Braided Gravel Channel--The Kawerong River, Bougainville, Papua New Guinea,
W79-06618 2J

BRAIDING
Estimating Sediment Transport in a Braided Gravel Channel--The Kawerong River, Bougainville, Papua New Guinea,
W79-06618 2J

BRAZIL
Ocean Dispersal as an Ultimate Disposal Method,
W79-06663 5C

Residual Strength Test, Paraitinga and Paraibuna Dams, Brazil,
W79-06879 8A

BRINE DISPOSAL
Operators Present Testimony in Defense of Playa Lake Disposal,
W79-06808 5C

BRINES
Equations of Volume and Salt Balances of Brine Ponds,
W79-06611 2A

Effects of Oilfield Brine Effluent on Sediments and Benthic Organisms in Trinity Bay, Texas,
W79-06665 5C

An Experimental Study of Brine Drainage and Convection in Young Sea Ice,
W79-06757 2C

Industrial Process Profiles for Environmental Use: Chapter 15. Brine and Evaporite Chemicals Industry,
W79-06990 5B

BRITISH COLUMBIA
Fluctuations of Chlorophyll and Related Physical Parameters in British Columbia Coastal Waters,
W79-06644 2L

BUBBLES
Destratification of Lakes Using Bubble Columns,
W79-06652 2H

BUILDING CODES
Investigation of Plastic Pipe for Use by the Corps of Engineers,
W79-06880 8A

BUREAU OF RECLAMATION
Western Economic Development and Water Planning: Bureau of Reclamation,
W79-06687 6A

BYPRODUCTS
Treatment and Recovery of Fluoride and Nitrate Industrial Wastes: Phase II,
W79-06869 5D

CADMIUM
Phosphate Fertilizer and Sewage Sludge Use on Agricultural Land - The Potential for Cadmium Uptake by Crops,
W79-06852 5G

CALCIUM CARBONATE
A Kinetic Study of the CaC03 Precipitation Reaction,
W79-06703 2K

CALCIUM SULFATE
Investigation of Calcium Sulfate Precipitation,
W79-06578 3A

CALIFORNIA
Summary of Potential Hazards and Engineering Constraints, Proposed OCS Lease Sale No. 48, Offshore Southern California,
W79-06515 5B

A Sea-Floor Seismic Monitoring Network Around an Offshore Oilfield Platform and Recording of the August 13, 1978 Santa Barbara Earthquake,
W79-06528 5B

Groundwater Law,
W79-06709 6E

The Influence of Electrolyte Concentration on Flocculation of Clay Suspensions,
W79-06761 2G

That Sinking Feeling.
W79-06804 2F

Air Chambers for Irrigation Systems,
W79-06939 3F

CANADA
Storm Runoff Microbiology Adds to Concerns,
W79-06590 5B

Fluctuations of Chlorophyll and Related Physical Parameters in British Columbia Coastal Waters,
W79-06644 2L

Carbon and Oxygen Isotope Ratios in the Saguenay Fjord and the St. Lawrence Estuary and their Implications for Paleoenvironmental Studies,
W79-06654 2L

Lake Surface Fluctuations and the Mass Flow Through the Narrows of Lake Winnipeg,
W79-06755 2H

Evaluation of Alternatives to the Garrison Diversion Unit,
W79-06798 6B

International Field Year for the Great Lakes.
W79-06874 10D

CANAL LININGS
Optimization of Salinity Control in Grand Valley,
W79-06936 6A

CANTON ATOLL
An Environmental Survey of Canton Atoll Lagoon, 1973.
W79-06881 2L

Canton Atoll Lagoon Physiography and General Oceanographic Observations,
W79-06882 2L

Water Composition and Biogeochemical Gradients in the Canton Atoll Lagoon,
W79-06883 2L

Reef Corals of Canton Atoll: I. Zoogeography,
W79-06884 2L

Reef Corals of Canton Atoll: II. Local Distribution,
W79-06885 2L

Distribution of Inshore Fishes at Canton Atoll,
W79-06886 2L

Molluscan Distribution Patterns at Canton Atoll,
W79-06887 2L

Observations on Terrestrial Surfaces and Subsurface Water as Related to Island Morphology at Canton Atoll,
W79-06888 2L

CAPACITY EXPANSION
Wastewater Treatment Capacity Expansion with Time-Varying Assimilative Constraints,
W79-06930 5D

CAPE COD BAY (MA)
South Coastal Water Quality Management Plan, 1975.
W79-06543 5G

CAPITAL COSTS
Study and Analysis of the Application of Saline Water Conversion Processes to Acid Mine Waters,
W79-06574 3A

CARBOHYDRATES
Spectral and Biochemical Characteristics of the Particulate Matter in Bedford Basin,
W79-06645 2L

CELLULOSE
Pretreatment and Substrate Evaluation for the Enzymatic Hydrolysis of Cellulosic Wastes,
W79-06995 5D

CENTRIFUGATION
Handling and Disposal of Sludges from Combined Sewer Overflow Treatment: Phase III--Treatability Studies,
W79-06946 5D

Field Protype Demonstration of the Swirl Degritter,
W79-06977 5D

CHANGES
Water Resources Planning--Its Recent Evolution,
W79-06678 6B

CHANNELS
Estimating Sediment Transport in a Braided Gravel Channel--The Kawerong River, Bougainville, Papua New Guinea,
W79-06618 2J

CHARLES RIVER
Fragmentation of Public Authority over Floodplains: The Charles River Response,
W79-06916 6E

CHEMICAL ANALYSIS
Ionic Stability of Precipitation Samples,
W79-06602 2K

Combined Measurement of Oxygen and Sulfide in Water Samples,
W79-06699 2K

Maryland Ground-Water Information: Chemical Quality Data,
W79-06820 2K

Inorganic Pollution in Water--The Analyst's Viewpoint,
W79-06821 7B

CHEMICAL INDUSTRY
Industrial Process Profiles for Environmental Use: Chapter 6. The Industrial Organic Chemicals Industry,
W79-06989 5B

Industrial Process Profiles for Environmental Use: Chapter 15. Brine and Evaporite Chemicals Industry,
W79-06990 5B

CHEMICAL PRECIPITATION
Investigation of Calcium Sulfate Precipitation,
W79-06578 3A

A Kinetic Study of the CaC03 Precipitation Reaction,
W79-06703 2K

Removal of Heavy Metals from Industrial Wastewaters Using Insoluble Starch Xanthate,
W79-06964 5D

CHEMICAL PROPERTIES
Preliminary Water-Quality Characterization of Lakes in Washington,
W79-06824 2H

IEMICAL WASTES
Fish Toxicity Evaluation of Effluents from an Organic Chemical Production Complex, BASF, Germany,
W79-06848 5C

Industrial Process Profiles for Environmental Use: Chapter 10. Plastics and Resins Industry,
W79-06986 5B

Industrial Process Profiles for Environmental Use: Chapter 6. The Industrial Organic Chemicals Industry,
W79-06989 5B

Industrial Process Profiles for Environmental Use: Chapter 15. Brine and Evaporite Chemicals Industry,
W79-06990 5B

IEMICALS
Effect of Hazardous Material Spills on Biological Treatment Processes,
W79-07000 7B

IEMISTRY OF PRECIPITATION
Ionic Stability of Precipitation Samples,
W79-06602 2K

IESAPEAKE BAY
Proceedings of the Bi-State Conference on the Chesapeake Bay April 27-29, 1977,
W79-06778 6B

Chesapeake Bay Future Conditions Report, Volume 4, Appendix 4: Water Related Land Resources.
W79-06793 6G

Chesapeake Bay Future Conditions Report Vol. 10, Appendix 13: Electric Power, Appendix 14: Noxious Weeds,
W79-06794 6B

Chesapeake Bay Future Conditions Report, Volume 12, Appendix 16: Hydraulic Model Testing,
W79-06795 6G

ILORIDES
Chloride as a Factor in Mobilities of Ni(II), Cu(II), and Cd(II) in Soil,
W79-06553 2K

ILORINATED HYDROCARBONS
Kepone/Mirex/Hexachlorocyclopentadiene: An Environmental Assessment.
W79-06566 5C

ILORINATION
Study on the Effectiveness of Disinfecting Sewage Containing Tuberculosis Bacilli Without Biological Treatment,
W79-06584 5D

An Automatic Chlorination System for Eliminating Biological Growth in Pumping Systems for Automatic Instrumentation,
W79-06789 5F

Full-Scale Demonstration of Nitrogen Removal by Breakpoint Chlorination,
W79-06791 5D

ILORINE
Disinfection Efficiency and Residual Toxicity of Several Wastewater Disinfectants. Volume II. Wyoming, Michigan,
W79-06509 5D

ILORINE COMPOUNDS
Design Optimization of High-Rate Disinfection Using Chlorine and Chlorine Dioxide,
W79-06803 5D

CHUKCHI SEA
Temperature Fine Structure Near the Sea-Ice Margin of the Chukchi Sea,
W79-06739 2L

CIRCULATION
A General Circulation Model for Lakes,
W79-06871 2H

CITIES
Contaminants Associated with Direct and Indirect Reuse of Municipal Wastewater.
W79-06567 5C

CITY PLANNING
Systematic Methodology to Numerically Evaluate Scenic Factors of Landscape: Application to Tippecanoe County, Indiana,
W79-06559 6A

The Morphogenesis of Iranian Cities,
W79-06842 6G

CLASSIFICATION
Wetland Classification System for the Tennessee Valley Region,
W79-06823 7C

CLAYS
The Influence of Electrolyte Concentration on Flocculation of Clay Suspensions,
W79-06761 2G

Industrial Process Profiles for Environmental Use: Chapter 19. The Clay Industry,
W79-06963 5B

CLOGGING
Formation Fines and Factors Controlling Their Movement in Porous Media,
W79-06864 2F

CLOUD SEEDING
The Development of Organic Ice Nuclei Generators for Weather Modification,
W79-06765 2B

Support Observations for Weather Modification Operations in the San Juan Mountains and a Procedure for Estimating Snowpack Runoff,
W79-06940 2A

CLOUDBURSTS
Flood Hazard Information: Animas River and Junction and Dry Gulch Creeks, Durango, Colorado.
W79-06532 2E

COALS
Hydrogeological Testing Associated with Underground Coal Gasification,
W79-06806 8E

COASTAL AQUIFERS
Approximate Analysis of Upconing,
W79-06920 2F

COASTS
A Dynamical Analysis of Currents Near the New Jersey Coast,
W79-06740 2L

Shorelines Management '77: Performance and Prospects.
W79-06786 6G

Man, Runoff and the Erosion of the Coastal Slopes of Ashkelon, Israel,
W79-06838 2J

COHESIVE SOILS
Kaolinite Resuspension Properties,
W79-06653 2J

COLIFORMS
Report of Committee on Ground Water Supplies in New England.
W79-06735 5G

Effect of Upgrading a Municipal Wastewater Effluent on Pollution Indicator and Other Microorganisms in River Water,
W79-06856 5B

COLOR
Satellite Surveillance of Physical Water-Quality Characteristics,
W79-06829 7B

COLORADO
Flood Hazard Information: Animas River and Junction and Dry Gulch Creeks, Durango, Colorado.
W79-06532 2E

Flood Hazard Information: Colorado River, Palisade, Colorado.
W79-06533 2E

COLORADO RIVER BASIN
Potential for Augmenting Flow of the Colorado River by Vegetation Management,
W79-06833 3B

COLORADO RIVER (CO)
Flood Hazard Information: Colorado River, Palisade, Colorado.
W79-06533 2E

COLUMBIA RIVER BASIN
Center Pivot Irrigation in the Columbia Basin of Washington and Oregon: Dynamics and Implications,
W79-06674 6E

Pacific Northwest River Basins Commission: Annual Report, Fiscal Year 1976,
W79-06771 6G

COMBINED SEWERS
Handling and Disposal of Sludges from Combined Sewer Overflow Treatment: Phase III--Treatability Studies,
W79-06946 5D

COMPACTION
Numerical Model for Land Subsidence in Shallow Ground Water Systems,
W79-06912 2F

COMPARISON TECHNIQUES
Evaluation of Alternatives to the Garrison Diversion Unit,
W79-06798 6B

COMPOSITE MEMBRANE
Final Report to Office of Water Research and Technology - Contract No. 14-34-0001-7513.
W79-06891 3A

COMPREHENSIVE PLANNING
Upper Mississippi River Basin Commission,
W79-06772 6G

Regional Development Plan Evaluation: The Use of Input-Output Analysis,
W79-06941 6A

COMPUTER GRAPHICS
Water Resources Planning Using Computer Graphics,
W79-06861 6A

COMPUTER MODELS
Regional Sewerage Planning by Mixed Integer Programming,
W79-06542 6A

Models for System Water Planning with Special Reference to Water Reuse,
W79-06560 6A

COMPUTER MODELS

Ground-Water Computer Models--State of the Art,
W79-06595 2F

A Demonstration of Areawide Water Resources Planning,
W79-06774 6A

Distributed Routing Rainfall-Runoff Model,
W79-06830 6A

Methane Migration Around Sanitary Landfills,
W79-06843 5B

Ground-Water Computer Models - Intellectual Toys,
W79-06907 7C

Ground-Water Computer Models - Practical Tools,
W79-06908 7C

COMPUTER PROGRAMS
Programming a Pocket Calculator for Solving Multiple Well, Variable Pumping Rate Problems,
W79-06593 7C

COMPUTERS
Programming a Pocket Calculator for Solving Multiple Well, Variable Pumping Rate Problems,
W79-06593 7C

CONCENTRATION
Accuracy Evaluation in the Calculation of Mass-Discharges,
W79-06619 5B

CONFERENCES
Proceedings, Fifth United States/Japan Conference on Sewage Treatment Technology,
W79-06779 5D

International Field Year for the Great Lakes.
W79-06874 10D

CONSTRUCTION
Evaluation of Trenchless Sewer Construction at South Bethany Beach, Delaware,
W79-06783 8A

CONSTRUCTION COSTS
Evaluation of Trenchless Sewer Construction at South Bethany Beach, Delaware,
W79-06783 8A

CONSTRUCTION JOINTS
Evaluation of Trenchless Sewer Construction at South Bethany Beach, Delaware,
W79-06783 8A

CONSTRUCTION MATERIALS
Evaluation of Trenchless Sewer Construction at South Bethany Beach, Delaware,
W79-06783 8A

CONSUMPTIVE USE
Water Balance in Irrigated Soils,
W79-06647 3F

CONTINUITY EQUATION
On the Aquifer's Integrated Balance Equations,
W79-06811 2F

CONTOUR FARMING
Farm Level Economic Evaluation of Erosion Control,

W79-06910 5C

DISINFECTION
Study on the Effectiveness of Disinfecting Sewage Containing Tuberculosis Bacilli Without Biological Treatment,
W79-06584 5D

Ozone Disinfection in Waste Water Treatment with Recycling of Ozonation Off Gas,
W79-06624 5D

Design Optimization of High-Rate Disinfection Using Chlorine and Chlorine Dioxide,
W79-06803 5D

DISPERSION
Line Plume and Ocean Outfall Dispersion,
W79-06651 5B

Determination of the Apparent Dispersion Coefficient of Solutes in Unsaturated Soil,
W79-06723 2G

On the Aquifer's Integrated Balance Equations,
W79-06811 2F

DISSOLVED OXYGEN
Steady-State Dissolved Oxygen Model of the Willamette River, Oregon,
W79-06818 5G

DISSOLVED SOLIDS
Accuracy Evaluation in the Calculation of Mass-Discharges,
W79-06619 5B

Dissolved-Solids Budget of Lake Okeechobee, Florida, October 1964 to September 1974,
W79-06817 2H

DISTRIBUTION
Effects of Thermal Loading on Bottom Invertebrates in a South Carolina Reservoir,
W79-06561 5C

Statistical Distribution of Different Cumulative Periods of Rainfall in Haryana,
W79-06752 2B

DISTRIBUTION PATTERNS
A Study of Rainfall Pattern in Relation to Crop Planning Over the Haryana State,
W79-06586 2B

Territorial Distribution of the Relationships Between Components of Water and Heat Balances,
W79-06616 2A

Distribution of Nutrients in the Gulf of St. Lawrence,
W79-06650 2L

Some Methods for Hypothesis Testing and Analysis with Biological Monitoring Data,
W79-06718 5A

Characteristics of Short Period Rainfall in Gujarat,
W79-06753 2B

Major Climatological Discontinuities in the Monthly Monsoon Activity in the Neighborhood of the Western Ghats,
W79-06754 2B

DISTRIBUTION SYSTEMS
The Morphogenesis of Iranian Cities,
W79-06842 6G

DIURNAL
Time as a Factor in Biomonitoring Estuarine Systems with Reference to Benthic Macrophytes and Epibenthic Fishes and Invertebrates,
W79-06719 5A

DIURNAL VARIATION
Impact of Nitrilotriacetic Acid (NTA) on an Activated Sludge Plant - A Field Study,
W79-06850 5E

DNEPR RIVER (USSR)
Factors Governing the Biological Productivity, Regime, and Content of Biogenic and Organic Substances in the Sequence of Dnepr Reservoirs,
W79-06614 5B

DOMESTIC WASTES
Sludge and Slime Separating and Settling Device,
W79-06626 5D

DOMINANCE MATRIX
Fuzzy Set Approaches to Planning in the Grand River Basin,
W79-06809 6B

DRAINAGE
Surface Storage on Bedded Cultivated Lands,
W79-06503 2G

Variable Drainable Porosity in Drainage Design,
W79-06605 2G

Economic Assessment of Storm Drainage Planning,
W79-06688 6B

Effects of Drainage Projects on Surface Runoff from Small Depressional Watersheds in the North Central Region,
W79-06729 2E

County Drainage Ditches in South Central Minnesota: A Unique Riparian Ecosystem,
W79-06876 4A

Physical-Geographic and Hydrologic Description of the Test Site in the USSR (Mountain Region of the Syrdar'ya River Basin in the Northern Part of the Fergana Depression) and Data on Ground Hydrologic, Meteorologic, and Actinometric Measurements,
W79-06878 2A

DRAINAGE AREA
County Drainage Ditches in South Central Minnesota: A Unique Riparian Ecosystem,
W79-06876 4A

DRAINAGE EFFECTS
County Drainage Ditches in South Central Minnesota: A Unique Riparian Ecosystem,
W79-06876 4A

DRAINAGE PIPES
Friction Factors for Corrugated Plastic Drainage Pipe,
W79-06608 8B

DRAINAGE PRACTICES
County Drainage Ditches in South Central Minnesota› A Unique Riparian Ecosystem,
W79-06876 4A

DRAINAGE PROGRAMS
County Drainage Ditches in South Central Minnesota: A Unique Riparian Ecosystem,
W79-06876 4A

DRAINAGE SYSTEMS
County Drainage Ditches in South Central Minnesota: A Unique Riparian Ecosystem,
W79-06876 4A

DRAINAGE WATER
Minimizing Salt in Drain Water by Irrigation Management--Design and Initial Results of Arizona Field Studies,
W79-06700 3F

DRILLERS
A Special Report: Ground Water Industry Leaders.
W79-06706 10F

DRILLING
The Organic Drilling Fluid Controversy: Part II,
W79-06898 8A

DRILLING FLUIDS
Mud, Brine May be Classified Hazardous Waste,
W79-06714 5G

The Organic Drilling Fluid Controversy: Part I,
W79-06897 8A

The Organic Drilling Fluid Controversy: Part II,
W79-06898 8A

DROUGHTS
The Effects of the 1975-76 Drought on Groundwater and Aquifers,
W79-06807 2E

Air Chambers for Irrigation Systems,
W79-06939 3F

DRY GULCH CREEK (CO)
Flood Hazard Information: Animas River and Junction and Dry Gulch Creeks, Durango, Colorado.
W79-06532 2E

DULUTH-SUPERIOR HARBORS
Ice Growth Studies in Duluth-Superior Harbor 1974-75,
W79-06763 2C

DYES
Industrial Process Profiles for Environmental Use: Chapter 7. Organic Dyes and Pigments Industry,
W79-06985 5B

DYNAMIC PROGRAMMING
Wastewater Treatment Capacity Expansion with Time-Varying Assimilative Constraints,
W79-06930 5D

Storage Mass-Curve Analysis in a Systems-Analytic Perspective,
W79-06932 6A

EARTH DAMS
Transient Seepage Analysis of Guri Dam,
W79-06587 8A

ECOLOGICAL DISTRIBUTION
Environmental Assessment of the Alaskan Continental Shelf. Quarterly Reports of Principal Investigators July - September 1978, Volume I.
W79-06510 5C

ECOLOGY
Ecological Investigations of Petroleum Production Platforms in the Central Gulf of Mexico - Preliminary Findings,
W79-06521 5C

An Independent Appraisal of the Offshore Ecology Investigation,
W79-06522 5C

Marine Ecosystem Modelling in the Mediterranean.
W79-06539 6A

Proceedings of the Bi-State Conference on the Chesapeake Bay April 27-29, 1977,
W79-06778 6B

Operational Effects of Irrigation and Pumped Storage on the Ecology of Banks Lake, Washington,
W79-06942 2H

ONOMIC ANALYSIS
Two Centuries of Water Planning Methodology,
W79-06679 6A

Economic Assessment of Storm Drainage Planning,
W79-06688 6B

ONOMIC DEVELOPMENT
Western Economic Development and Water Planning: Bureau of Reclamation,
W79-06687 6A

ONOMIC EFFICIENCY
Integrated Water Management with Reuse: A Programming Approach,
W79-06673 6A

ONOMIC FEASIBILITY
Research on Mineral By-Products from Saline Waters,
W79-06573 3A

Preliminary Economic Analysis of Solar Irrigation Systems (SIS) for Selected Locations,
W79-06781 6B

ONOMICS
Economics and Water Resources Planning in America,
W79-06680 6B

The Role of Economic Models in Evaluating Commercial Fishery Resources,
W79-06926 6B

Economic Analysis, Root Control, and Backwater Flow Control as Related to Infiltration/Inflow Control,
W79-06952 8A

OSYSTEMS
Marine Ecosystem Modelling in the Mediterranean.
W79-06539 6A

DIES
assage of Anticyclonic Gulf Stream Eddies hrough Deepwater Dumpsite 106 During 1974 nd 1975,
W79-06514 5B

FECTS
actors Affecting Waterway Investment Decions,
W79-06670 6B

enter Pivot Irrigation in the Columbia Basin of Vashington and Oregon: Dynamics and Implications,
W79-06674 6E

esign Optimization of High-Rate Disinfection sing Chlorine and Chlorine Dioxide,
W79-06803 5D

FICIENCY
Water Hyacinths for Upgrading Sewage Lagoons to Meet Advanced Wastewater Treatment Standards: Part II,
W79-06508 5D

EFFLUENT STREAMS
Industrial Process Profiles for Environmental Use: Chapter 2. Oil and Gas Production Industry,
W79-06984 5A

Industrial Process Profiles for Environmental Use: Chapter 26. Titanium Industry,
W79-06987 5B

EFFLUENTS
Fish Toxicity Evaluation of Effluents from an Organic Chemical Production Complex, BASF, Germany,
W79-06848 5C

Source Assessment: Textile Plant Wastewater Toxics Study -- Phase I,
W79-06867 5A

Characterization of Reusable Municipal Wastewater Effluents and Concentration of Organic Constituents,
W79-06868 5F

ELASTICITIES OF SUBSTITUTION
Substituting for Water Inputs in U.S. Manufacturing,
W79-06931 6C

ELECTRIC POWER
Chesapeake Bay Future Conditions Report Vol. 10, Appendix 13: Electric Power, Appendix 14: Noxious Weeds,
W79-06794 6B

ELECTRICAL WIRING
Water Systems Basics--Part IV.
W79-06899 8C

ELECTRO-OSMOSIS
Electro-Osmosis in Ground Water Pollution Control,
W79-06913 5G

ELECTRODIALYSIS
Electrodialysis for Closed Loop Control of Cyanide Rinse Waters,
W79-06993 5D

ELECTROLYTES
The Influence of Electrolyte Concentration on Flocculation of Clay Suspensions,

SHING MILLS
Economics and Water Resources Planning in America,
W79-06680 6B

ASH DISTILLATION
First Annual Report: Saline Water Demonstration Plant No. 2, San Diego, California.
W79-06580 3A

Improved Treatment of Lime-Sulfide Tannery Unhairing Waste.
W79-06967 5D

ASH FLOODS
Guidelines for Flash Flood and Small Tributary Flood Prediction,
W79-06563 2B

OCCULATION
Characterization of Priority Pollutants from a Secondary Lead and Battery Manufacturing Facility,
W79-06541 5D

The Influence of Electrolyte Concentration on Flocculation of Clay Suspensions,
W79-06761 2G

Improved Treatment of Lime-Sulfide Tannery Unhairing Waste.
W79-06967 5D

FLOOD CONTROL
Economic Analysis of Structural Flood Proofing,
W79-06689 6B

FLOOD DATA
Flood Hazard Information: Animas River and Junction and Dry Gulch Creeks, Durango, Colorado.
W79-06532 2E

FLOOD EXPECTANCY
A Planning Algorithm to Assess the Impact of Urban Growth on Flood Expectancy,
W79-06726 2E

FLOOD FLOWS
Effects of Drainage Projects on Surface Runoff from Small Depressional Watersheds in the North Central Region,
W79-06729 2E

FLOOD FORECASTING
Guidelines for Flash Flood and Small Tributary Flood Prediction,
W79-06563 2B

FLOOD FREQUENCY
A Planning Algorithm to Assess the Impact of Urban Growth on Flood Expectancy,
W79-06726 2E

FLOOD IRRIGATION
Water Balance of Flooded Rice Paddies,
W79-06713 2I

FLOOD PLAIN ZONING
Fragmentation of Public Authority over Floodplains: The Charles River Response,
W79-06916 6E

FLOOD PLAINS
Flood Hazard Information: Colorado River, Palisade, Colorado.
W79-06533 2E

A Comparison of Three Flooding Regimes, Atchafalaya Basin, Louisiana,
W79-06943 4A

FLOOD PROTECTION
Fragmentation of Public Authority over Floodplains: The Charles River Response,
W79-06916 6E

FLOOD VOLUMES
Urban Storm Water Management: Distribution of Flood Volumes,
W79-06934 2E

FLOOD WAVES
Two-Dimensional Shallow Water-Wave Models,
W79-06588 8B

FLOODING
Externalities from Urban Growth: The Case of Increased Storm Runoff and Flooding,
W79-06727 2E

FLOODPLAIN INSURANCE
Fragmentation of Public Authority over Floodplains: The Charles River Response,
W79-06916 6E

FLOODPROOFING
Economic Analysis of Structural Flood Proofing,
W79-06689 6B

FLOODS
Flood Hazard Information: Colorado River, Palisade, Colorado.
W79-06533 2E

Stream Network Analysis and Geomorphic Flood Plain Mapping from Orbital and Suborbital Remote Sensing Imagery Application to Flood Hazard Studies in Central Texas,
W79-06877 7B

FLORIDA
Meteorological Forcing of Coastal Waters by the Inverse Barometer Effect,
W79-06658 2L

Water-Resources Investigations in Florida, 1977,
W79-06822 7C

FLOW
Flow in a Bend in a Rotating Open Channel,
W79-06759 8B

Approximate Analysis of Upconing,
W79-06920 2F

Simulation of Groundwater Flow and Mass Transport Under Uncertainty,
W79-06922 2F

FLOW AUGMENTATION
Potential for Augmenting Flow of the Colorado River by Vegetation Management,
W79-06833 3B

FLOW CHARACTERISTICS
Effects of Flow Equalization on the Operation and Performance of an Activated Sludge Plant,
W79-06972 5D

Control of Sewer Overflows by Polymer Injection,
W79-06973 8A

FLOW CONTROL
Liquid Flow Control Device,
W79-06636 3F

Supercritical Withdrawal from Two-Layered Fluid Systems, Part 1: Two-Dimensional Skimmer Wall,
W79-06766 2H

Supercritical Withdrawal from Two-Layered Fluid Systems, Part 2: Three-Dimensional Flow into Round Intake,
W79-06767 2H

FLOW DURATION
Synthesis of Flow-Duration Curves for Unregulated Streams in New Hampshire,
W79-06725 2E

Present and Potential Sediment Yields in the Yampa River Basin, Colorado and Wyoming,
W79-06825 2J

FLOW-DURATION CURVES
Utilization and Interpretation of Hydrologic Data with Selected Examples from New Hampshire,
W79-06502 7A

FLOW MEASUREMENT
Sewer Infiltration and Inflow Control Product and Equipment Guide,
W79-06980 8A

FLOW REQUIREMENTS
Integrated Water Management with Reuse: A Programming Approach,
W79-06673 6A

FOAMING
Actinomycetes of Sewage-Treatment Plants,
W79-06982 5D

FOG
Dew, Fog and Hygroscopic Food as a Source of Water for Desert Arthropods,
W79-06834 6B

FOOD CHAINS
Size Dependent Model of Hazardous Substances in Aquatic Food Chain,
W79-06954 5B

FOOD HABITS
The Predictability of Rain and the Foraging Patterns of the Red Kangaroo (Megaleia Rufa) in Central Australia,

Estimating Sediment Transport in a Braided Gravel Channel--The Kawerong River, Bougainville, Papua New Guinea,
W79-06618 2J

KEPONE
Kepone/Mirex/Hexachlorocyclopentadiene: An Environmental Assessment.
W79-06566 5C

KOLYMA ESTUARY (USSR)
Experimental Numerical Simulation of Unsteady Water Flow in a Multibranch River Delta,
W79-06749 2L

LABORATORY EQUIPMENT
Design and Construction of a Desalination Pilot Plant, (A Reverse Osmosis Process).
W79-06579 3A

LABORATORY TESTS
Investigation of Calcium Sulfate Precipitation,
W79-06578 3A

Booms Used for Oil Slick Control,
W79-06589 5G

Statistical Analysis of the 1975 Intercomparison Study on Lake Erie,
W79-06601 2H

The Intrusion of Fine Sediments into a Stable Gravel Bed,
W79-06643 2J

Kaolinite Resuspension Properties,
W79-06653 2J

The Effect of Discharge Rate and Intermittent Water Application by Point-Source Irrigation on the Soil Moisture Distribution Pattern,
W79-06660 2G

Flow Patterns During Extended Saturated Flow in Two, Undisturbed Swelling Clay Soils with Different Macrostructures,
W79-06661 2G

Investigation of the Speed of Bed Load Movement,
W79-06751 2J

An Experimental Study of Brine Drainage and Convection in Young Sea Ice,
W79-06757 2C

AGOONS
Venice: Sea-Lagoon Exchange in a Modified Tide Range,
W79-06659 2L

An Environmental Survey of Canton Atoll Lagoon, 1973.
W79-06881 2L

Canton Atoll Lagoon Physiography and General Oceanographic Observations,
W79-06882 2L

Water Composition and Biogeochemical Gradients in the Canton Atoll Lagoon,
W79-06883 2L

AKE ERIE
Modelling Ice Dissipation in Eastern Lake Erie,
W79-06598 2C

Statistical Analysis of the 1975 Intercomparison Study on Lake Erie,
W79-06601 2H

AKE HURON
Factors in the Determination of Selected Trace Elements in Near-Shore U.S. Waters of Lakes Superior and Huron,
W79-06597 5A

AKE ICE
Modelling Ice Dissipation in Eastern Lake Erie,
W79-06598 2C

Ice Growth Studies in Duluth-Superior Harbor 1974-75,
W79-06763 2C

AKE MORPHOLOGY
A General Circulation Model for Lakes,
W79-06871 2H

AKE MORPHOMETRY
Hydrology of Lakes in the Minneapolis-Saint Paul Metropolitan Area: A Summary of Available Data Stored--Using a Data-Base Management System,
W79-06815 2H

Seasonal Succession of Phytoplankton in Roosevelt Lake, Arizona,
W79-06845 2H

AKE OKEECHOBEE
Dissolved-Solids Budget of Lake Okeechobee, Florida, October 1964 to September 1974,
W79-06817 2H

AKE ONTARIO
Low-Frequency Current Fluctuations in Lake Ontario, Winter 1972-1973 (IFYGL),
W79-06756 2H

International Field Year for the Great Lakes.
W79-06874 10D

LAKE STAGES
Estimation of Water Surface Elevation Probabilities and Associated Damages for the Great Salt Lake,
W79-06894 2H

LAKE SUPERIOR
Lake Superior Organic Carbon Budget,
W79-06504 5C

Spectral Distribution of Radiation in the Northern Great Lakes During Winter,
W79-06596 2H

Factors in the Determination of Selected Trace Elements in Near-Shore U.S. Waters of Lakes Superior and Huron,
W79-06597 5A

Chemical Loadings to Southwestern Lake Superior from Red Clay Erosion and Resuspension,
W79-06599 2H

Identification of Contaminants in Lake Superior Through LANDSAT I Data,
W79-06600 5A

Ice Growth Studies in Duluth-Superior Harbor 1974-75,
W79-06763 2C

LAKE WINNIPEG (MANITOBA)
Lake Surface Fluctuations and the Mass Flow Through the Narrows of Lake Winnipeg,
W79-06755 2H

LAKES
Destratification of Lakes Using Bubble Columns,
W79-06652 2H

Lake Surface Fluctuations and the Mass Flow Through the Narrows of Lake Winnipeg,
W79-06755 2H

Hydrology of Lakes in the Minneapolis-Saint Paul Metropolitan Area: A Summary of Available Data Stored--Using a Data-Base Management System,
W79-06815 2H

Dissolved-Solids Budget of Lake Okeechobee, Florida, October 1964 to September 1974,
W79-06817 2H

Biological and Microbiological Assessment of the Upper Chattahoochee River Basin, Georgia,
W79-06819 5C

Preliminary Water-Quality Characterization of Lakes in Washington,
W79-06824 2H

A General Circulation Model for Lakes,
W79-06871 2H

Proceedings: Lake Management Conference, June 9, 1977, University of Connecticut, Storrs.
W79-06893 2H

Quantitative Techniques for the Assessment of Lake Quality,
W79-06938 5A

Effects of Diversion and Alum Application on Two Eutrophic Lakes,
W79-06950 5D

LAND DEVELOPMENT
Chesapeake Bay Future Conditions Report, Volume 4, Appendix 4: Water Related Land Resources.
W79-06793 6G

LAND MANAGEMENT
Evaluation of Existing Systems for Land Treatment of Wastewater at Manteca, California, and Quincy, Washington,
W79-06975 5D

LAND MANAGEMENTS
New England River Basins Commission.
W79-06790 6G

LAND RECLAMATION
A Drainage Model for a Reclaimed Surface Mine,
W79-06743 4A

LAND RESOURCES
Chesapeake Bay Future Conditions Report, Volume 4, Appendix 4: Water Related Land Resources.
W79-06793 6G

LAND SUBSIDENCE
Subsidence and Related Effects on Wastewater Collection and Treatment Facilities.
W79-06562 6G

That Sinking Feeling.
W79-06804 2F

Numerical Model for Land Subsidence in Shallow Ground Water Systems,
W79-06912 2F

LAND USE
Pacific Northwest River Basins Commission: Annual Report, Fiscal Year 1976,
W79-06771 6G

Upper Mississippi River Basin Commission,
W79-06772 6G

Attitudes of Nearby Residents Toward Establishing Sanitary Landfills,
W79-06785 5C

Phosphate Fertilizer and Sewage Sludge Use on Agricultural Land - The Potential for Cadmium Uptake by Crops,
W79-06852 5G

W79-06918 6A

Land Treatment of Wastewater in Southeastern Michigan,
W79-06971 5D

Treatment and Disposal of Wastes Pumped from Septic Tanks,
W79-06974 5D

Municipal Sludge Management Environmental Factors.
W79-06998 5E

LANDFILLS
Attitudes of Nearby Residents Toward Establishing Sanitary Landfills,
W79-06785 5C

Methane Migration Around Sanitary Landfills,
W79-06843 5B

Landfill Cell Designed for Hazardous Waste Disposal,
W79-06863 5G

Sewage Sludge Entrenchment System for Use by Small Municipalities,
W79-06947 5E

Disposal of Sewage Sludge into a Sanitary Landfill,
W79-06965 5E

LANDFILLS

Municipal Sludge Management Environmental Factors.
W79-06998 5E

LANDSAT
The Use of LANDSAT DCS and Imagery in Reservoir Management and Operation,
W79-06762 4A

LANDSAT IMAGES
Satellite Surveillance of Physical Water-Quality Characteristics,
W79-06829 7B

LANDSCAPING
Systematic Methodology to Numerically Evaluate Scenic Factors of Landscape: Application to Tippecanoe County, Indiana,
W79-06559 6A

The Metland Landscape Planning Process: Composite Landscape Assessment, Alternative Plan Formulation and Plan Evaluation: Part 3 of the Metropolitan Landscape Planning Model,
W79-06918 6A

LEACHATE
Sorbents for Fluoride, Metal Finishing, and Petroleum Sludge Leachate Contaminant Control,
W79-06873 5D

LEACHING
Leaching Control Can't be Perfect,
W79-06696 3F

Minimizing Salt in Drain Water by Irrigation Management--Design and Initial Results of Arizona Field Studies,
W79-06700 3F

LEAD
Concentrations and Temporal Variations of 210PO, 210PB, and Al in the Surf Zone Ecosystem of Copalis Beach, Washington,
W79-06655 2L

LEAST-COST REGIONALIZATION
Cost Allocation for a Regional Wastewater Treatment System,
W79-06929 5D

LEGISLATION
State Water Quality Control Program in Arizona,
W79-06675 6E

Water Planning--Overview,
W79-06676 6B

Groundwater Law,
W79-06709 6E

LEPOMIS
Evaluation of an Automated Biological Monitoring System at an Industrial Site,
W79-06721 5A

LIME
Characterization of Priority Pollutants from a Secondary Lead and Battery Manufacturing Facility,
W79-06541 5D

LIMNOLOGY
Hydrology of Lakes in the Minneapolis-Saint Paul Metropolitan Area: A Summary of Available Data Stored--Using a Data-Base Management System,
W79-06815 2H

Operational Effects of Irrigation and Pumped Storage on the Ecology of Banks Lake, Washington,
W79-06942 2H

LINEAR PROGRAMMING
Stochastic Analysis for Water Quality,
W79-06501 6A

Storage Mass-Curve Analysis in a Systems-Analytic Perspective,
W79-06932 6A

LONG-TERM PLANNING
Two-Step Algorithm for Design-Stage Long-Term Control of a Multipurpose Reservoir,
W79-06810 6A

LOUISIANA
An Independent Appraisal of the Offshore Ecology Investigation,
W79-06522 5C

LOW FLOW
Steady-State Dissolved Oxygen Model of the Willamette River, Oregon,
W79-06818 5G

LOW PRESSURE MEMBRANE
Final Report to Office of Water Research and Technology - Contract No. 14-34-0001-7513.
W79-06891 3A

LUBRICANTS
Industrial Process Profiles for Environmental Use: Chapter 11. The Synthetic Fiber Industry,
W79-06962 5B

LYSIMETERS
Results of Lysimeter Trials at the Limburgerhof Facility 1927-1977; The Most Important Findings from 50 Years of Experiments,
W79-06746 2G

MALAWI
Botswana and Malawi Rural Water Supplie.
W79-06724 8A

MANAGEMENT
Water Quality Management Guide for Mine-Related Pollution Sources (New, Current and Abandoned),

OGALLALA AQUIFER (TX)
Analytical Study of the Ogallala Aquifer in Gaines County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W79-06738 7C

OIL
New Approaches to the Preservation of Contaminants in Water Samples,
W79-06545 5A

OIL INDUSTRY
Trace Organic Variation Across the Wastewater Treatment System of a Class-B Refinery,
W79-06956 5D

Industrial Process Profiles for Environmental Use: Chapter 2. Oil and Gas Production Industry,
W79-06984 5A

OIL POLLUTION
A Collision Avoidance System for Offshore Operations,
W79-06520 5B

An Independent Appraisal of the Offshore Ecology Investigation,
W79-06522 5C

Shipboard Oily Water Pollution - A Practical Guide for the Owner and Designer,
W79-06524 5B

Two-Stage Oil Skimmer Separator,
W79-06627 5D

Separating Device to Separate Two Liquids of Different Specific Gravity,
W79-06628 5G

Slotted Baffle for Use in Separating Oil-Water Mixtures,
W79-06629 5G

Effects of Prudhoe Bay Crude Oil on Primary Production and Zooplankton in Arctic Trundra Thaw Ponds,
W79-06666 5C

Oil, Fisheries, and the Health of the Ecosystem: A Review,
W79-06667 5C

Oil/Water Separation: State-of-the-Art,
W79-06775 5D

OIL SPILL
An Introduction to the Oilspill Risk Analysis Model,
W79-06523 5B

OIL SPILLS
The Mixing of Oil Spills into the Sea by Breaking Waves,
W79-06525 5C

Booms Used for Oil Slick Control,
W79-06589 5G

Device for Retrieving Floating Pollutants on Surface Water,
W79-06634 5G

Oil, Fisheries, and the Health of the Ecosystem: A Review,
W79-06667 5C

Oil/Water Separation: State-of-the-Art,
W79-06775 5D

OIL SPILLS

Marketing Feasibility of Using Cedar Mill Waste for Oil Spill Clean-Ups,
W79-06788 5D

Coast Guard Response to Oil Spills--Trying to Do too Much with too Little,
W79-06949 5D

OILY WATER

Industrial Process Profiles for Environmental Use: Chapter 2. Oil and Gas Production Industry,
W79-06984 5A

ON-SITE DATA COLLECTIONS

Nonpoint Source Sampling Design Report Areawide Waste Treatment Management Plan for the Greater Houston Area.
W79-06569 7A

ON-SITE INVESTIGATIONS

Storm Runoff Microbiology Adds to Concerns,
W79-06590 5B

The Effect of Discharge Rate and Intermittent Water Application by Point-Source Irrigation on the Soil Moisture Distribution Pattern,
W79-06660 2G

Rates of Weathering and Soil Formation on Granite in Rhodesia,
W79-06741 2A

Morphology and Water Regime of a Dothan Soil,
W79-06742 2F

Water Composition and Biogeochemical Gradients in the Canton Atoll Lagoon,
W79-06883 2L

Impact of Wastes from a Water Treatment Plant: Evaluative Procedures and Results,
W79-06889 5E

ON-SITE TESTS

Fluctuations of Chlorophyll and Related Physical Parameters in British Columbia Coastal Waters,
W79-06644 2L

Control of Sewer Overflows by Polymer Injection,
W79-06973 8A

OPACITY

Air Pollution Aspects of Sludge Incineration.
W79-06540 5D

OPEN CHANNELS

Flow in a Bend in a Rotating Open Channel,
W79-06759 8B

OPERATIONS

Technical Assistance Project, Trinidad Wastewater Treatment Facility, Trinidad, Colorado.
W79-06970 5D

OPERATIONS RESEARCH

Optimal Weekly Releases from a Seasonal Reservoir 1. Deterministic Future,
W79-06919 4A

OPTIMIZATION

Design Optimization of High-Rate Disinfection Using Chlorine and Chlorine Dioxide,
W79-06803 5D

Optimal Weekly Releases from a Seasonal Reservoir 1. Deterministic Future,
W79-06919 4A

Optimal Water Pricing and Storage with Cyclical Supply and Demand,
W79-06933 6C

Optimization of Salinity Control in Grand Valley,
W79-06936 6A

Reducing Salt Pickup from Irrigated Lands,
W79-06937 3F

ORGANIC CARBQN

Lake Superior Organic Carbon Budget,
W79-06504 5C

ORGANIC COMPOUNDS

Determination of Acetone and Methyl Ethyl Ketone in Water,
W79-06812 5A

Industrial Process Profiles for Environmental Use: Chapter 9. The Synthetic Rubber Industry,
W79-06959 5B

Industrial Process Profiles for Environmental Use: Chapter 12. The Explosives Industry,
W79-06960 5B

Industrial Process Profiles for Environmental Use: Chapter 7. Organic Dyes and Pigments Industry,
W79-06985 5B

Industrial Process Profiles for Environmental Use: Chapter 10. Plastics and Resins Industry,
W79-06986 5B

ORGANIC MATTER

Factors Governing the Biological Productivity, Regime, and Content of Biogenic and Organic Substances in the Sequence of Dnepr Reservoirs,
W79-06614 5B

Spectral and Biochemical Characteristics of the Particulate Matter in Bedford Basin,
W79-06645 2L

Best Use of Crop Residues,
W79-06704 3F

ORGANIC PESTICIDES

Kepone/Mirex/Hexachlorocyclopentadiene: An Environmental Assessment.
W79-06566 5C

ORGANIC WASTES

Process for the Hygienic Elimination of Sewage Containing Salt-Containing Organic Substances,
W79-06625 5D

Method of Purifying Waste Water,
W79-06639 5D

Fish Toxicity Evaluation of Effluents from an Organic Chemical Production Complex, BASF, Germany,
W79-06848 5C

Industrial Process Profiles for Environmental Use: Chapter 9. The Synthetic Rubber Industry,
W79-06959 5B

OSMOTIC PRESSURE

Leaf Osmotic Potential as an Indicator of Crop Water Deficit and Irrigation Need in Rapeseed (Brassica Napus L.),
W79-06708 2I

OUTER CONTINENTAL SHELF

Environmental Assessment of the Alaskan Continental Shelf. Quarterly Reports of Principal Investigators July - September 1978, Volume I.
W79-06510 5C

Environmental Assessment of the Alaskan Continental Shelf. Quarterly Reports of Principal Investigators July - September 1978. Volume II.
W79-06511 5B

Environmental Assessment of the Alaskan Continental Shelf. Quarterly Reports of Principal Investigators October - December 1978. Volume I.
W79-06512 5C

Environmental Assessment of the Alaskan Continental Shelf. Quarterly Reports of Principal Investigators October - December 1978. Volume II.
W79-06513 5B

Passage of Anticyclonic Gulf Stream Eddies Through Deepwater Dumpsite 106 During 1974 and 1975,
W79-06514 5B

Summary of Potential Hazards and Engineering Constraints, Proposed OCS Lease Sale No. 48 Offshore Southern California,
W79-06515 5B

A Summary of Interacting, Surficial Geologic Processes and Potential Geologic Hazards in the Norton Basin, Northern Bering Sea,
W79-06516 5B

On the Concentration of Sulfate in Precipitation,
W79-06592 5B

Support Observations for Weather Modification Operations in the San Juan Mountains and a Procedure for Estimating Snowpack Runoff,
W79-06940 2A

PRESERVATION
New Approaches to the Preservation of Contaminants in Water Samples,
W79-06545 5A

PRESSURE CONDUITS
Investigation of Plastic Pipe for Use by the Corps of Engineers,
W79-06880 8A

PRESSURE-WORK
On Pressure-Work, Viscous Dissipation and the Energy Balance Relation for Geothermal Reservoirs,
W79-06924 2H

PRICING
Optimal Water Pricing and Storage with Cyclical Supply and Demand,
W79-06933 6C

PRIMARY PRODUCTIVITY
Effects of Prudhoe Bay Crude Oil on Primary Production and Zooplankton in Arctic Trundra Thaw Ponds,
W79-06666 5C

PROBABILITY
Water Quality in River Systems: Monte-Carlo Analysis,
W79-06935 6A

PROGRAMS
State Water Quality Control Program in Arizona,
W79-06675 6E

PROJECTIONS
Ground-Water Computer Models - Intellectual Toys,
W79-06907 7C

PROJECTS
Irrigation Planning Based on Water Deficits,
W79-06797 6B

Water-Resources Investigations in Florida, 1977,
W79-06822 7C

PROTECTION
The 208 Planning Approach to Ground Water Protection - A Foot in the Door,
W79-06905 5G

PUBLIC HEALTH
Contaminants Associated with Direct and Indirect Reuse of Municipal Wastewater.
W79-06567 5C

Tropical Disease Bilharzia and Irrigation Systems in Puerto Rico,
W79-06671 5G

Planning for Water Quality: 1776 to 1976,
W79-06685 5G

Characterization of Reusable Municipal Wastewater Effluents and Concentration of Organic Constituents,
W79-06868 5F

The Health Effects of Ground Water Recharge: Part II,
W79-06896 5G

Health Effects of Human Exposure to Barium in Drinking Water,
W79-06944 5C

Human Health Effects of Molybdenum in Drinking Water,
W79-06945 5C

PUBLIC WORKS
Water Resources Planning--Historical Development,
W79-06677 6E

Social Aspects of Water Resources Planning,
W79-06682 6B

PUBLICATIONS
Manual for Evaluating Secondary Impacts of Wastewater Treatment Facilities,
W79-06777 6B

PUBLICATIONS

Third Annotated Bibliography on Biological Effects of Metals in Aquatic Environments (No. 1293-2246),
W79-06866 5C

PUERTO RICO
Tropical Disease Bilharzia and Irrigation Systems in Puerto Rico,
W79-06671 5G

PULP AND PAPER INDUSTRY
Monitoring Program Needed for Wise Treatment Choices,
W79-06722 5A

Pilot Investigation of Secondary Sludge Dewatering Alternatives,
W79-06948 5D

Pretreatment and Substrate Evaluation for the Enzymatic Hydrolysis of Cellulosic Wastes,
W79-06995 5D

PULP WASTES
Papermill Effluent Turbidity Removal -- A New Approach,
W79-06620 5D

Process for Purification of Waste Water Produced by a Kraft Process Pulp and Paper Mill,
W79-06638 5D

Pilot Investigation of Secondary Sludge Dewatering Alternatives,
W79-06948 5D

PUMPED STORAGE
Operational Effects of Irrigation and Pumped Storage on the Ecology of Banks Lake, Washington,
W79-06942 2H

PUMPING
Alteration of Hydrogeologic Conditions During Mining of Mineral Deposits and Water-Resource Conservation Measures,
W79-06615 5G

PUMPS
Water Systems Basics--Part IV.
W79-06899 8C

PUNE (INDIA)
Soil Moisture Variation Under Bare Conditions at Pune and Delhi in Relation to Rainfall,
W79-06750 2G

QUANTITATIVE METHODS
Quantitative Techniques for the Assessment of Lake Quality,
W79-06938 5A

RADAR
Guidelines for Flash Flood and Small Tributary Flood Prediction,
W79-06563 2B

RADIATION
Spectral Distribution of Radiation in the Northern Great Lakes During Winter,
W79-06596 2H

RAINFALL
A Study of Rainfall Pattern in Relation to Crop Planning Over the Haryana State,
W79-06586 2B

Statistics of Rainfall Over Paths from 1 to 50 km,
W79-06603 2B

Rain Water Management for Lowland Rice Cultivation in India,
W79-06604 4A

Soil Moisture Variation Under Bare Conditions at Pune and Delhi in Relation to Rainfall,
W79-06750 2G

Statistical Distribution of Different Cumulative Periods of Rainfall in Haryana,
W79-06752 2B

Characteristics of Short Period Rainfall in Gujarat,
W79-06753 2B

Major Climatological Discontinuities in the Monthly Monsoon Activity in the Neighborhood of the Western Ghats,
W79-06754 2B

Urban Storm Water Management: Distribution of Flood Volumes,
W79-06934 2E

RAINFALL DISPOSITION
The Predictability of Rain and the Foraging Patterns of the Red Kangaroo (Megaleia Rufa) in Central Australia,
W79-06835 6G

RAINFALL INTENSITY
Guidelines for Flash Flood and Small Tributary Flood Prediction,
W79-06563 2B

RAINFALL-RUNOFF RELATIONSHIPS
Distributed Routing Rainfall-Runoff Model,
W79-06830 6A

Runoff Evaluation of Catchments at Granite Reef,
W79-06832 4A

Runoff Rainfall Analysis for Bare Soils,
W79-06837 2E

Water Harvesting Agrisystem to Grow Jojoba on Developed Idle Farmland,
W79-06846 3F

REAERATION
Development of a Modified Tracer Technique for Measuring the Stream Reaeration Rate,
W79-06915 5G

RECEIVING WATER
The Relationship Between Best Management Practices and Receiving-Water Standards,
W79-06669 5B

Wastewater Treatment Capacity Expansion with Time-Varying Assimilative Constraints,
W79-06930 5D

RECIRCULATED WATER
Recycling of Water in Poultry Processing Plants,
W79-06953 3E

RECYCLING
Putting Sludge to Work.
W79-06805 5D

Electrodialysis for Closed Loop Control of Cyanide Rinse Waters,
W79-06993 5D

Removal and Recovery of Sulfide from Tannery Wastewater,
W79-06999 5D

REEFS
Reef Corals of Canton Atoll: I. Zoogeography,
W79-06884 2L

Reef Corals of Canton Atoll: II. Local Distribution,
W79-06885 2L

REGIME
A Comparison of Three Flooding Regimes, Atchafalaya Basin, Louisiana,
W79-06943 4A

REGIONAL ANALYSIS
The Role of Economic Models in Evaluating Commercial Fishery Resources,
W79-06926 6B

REGIONAL DEVELOPMENT
Pacific Northwest River Basins Commission: Annual Report, Fiscal Year 1976,
W79-06771 6G

The Morphogenesis of Iranian Cities,
W79-06842 6G

Regional Development Plan Evaluation: The Use of Input-Output Analysis,
W79-06941 6A

A Comparison of Three Flooding Regimes, Atchafalaya Basin, Louisiana,
W79-06943 4A

REGIONAL PLANNING
Regional Sewerage Planning by Mixed Integer Programming,
W79-06542 6A

South Coastal Water Quality Management Plan, 1975.
W79-06543 5G

REGRESSION ANALYSIS
Utilization and Interpretation of Hydrologic Data with Selected Examples from New Hampshire,
W79-06502 7A

Design Optimization of High-Rate Disinfection Using Chlorine and Chlorine Dioxide,
W79-06803 5D

REGULATION
Water Quality Management Planning Is Not Comprehensive and May Not Be Effective for Many Years.
W79-06536 6E

The Relationship Between Best Management Practices and Receiving-Water Standards,
W79-06669 5B

REGULATIONS
Mud, Brine May be Classified Hazardous Waste,
W79-06714 5G

REHABILITATION
Sewer System Evaluation, Rehabilitation and New Construction A Manual of Practice,
W79-06506 8A

REMOTE SENSING
Satellites as an Aid to Water Resource Managers,
W79-06505 2C

Identification of Contaminants in Lake Superior Through LANDSAT I Data,
W79-06600 5A

Remote Sensing for Agricultural Water Management and Crop Yield Prediction,
W79-06698 3F

The Use of LANDSAT DCS and Imagery in Reservoir Management and Operation,
W79-06762 4A

Snow Survey and Vegetation Growth in the Swiss Alps,
W79-06764 7B

Satellite Surveillance of Physical Water-Quality Characteristics,
W79-06829 7B

Stream Network Analysis and Geomorphic Flood Plain Mapping from Orbital and Suborbital Remote Sensing Imagery Application to Flood Hazard Studies in Central Texas,
W79-06877 7B

RESERVOIR OPERATION
Optimal Weekly Releases from a Seasonal Reservoir 1. Deterministic Future,
W79-06919 4A

Storage Mass-Curve Analysis in a Systems-Analytic Perspective,
W79-06932 6A

Optimal Water Pricing and Storage with Cyclical Supply and Demand,
W79-06933 6C

RESERVOIR RELEASES
Optimal Weekly Releases from a Seasonal Reservoir 1. Deterministic Future,
W79-06919 4A

RESERVOIR STORAGE
Storage Mass-Curve Analysis in a Systems-Analytic Perspective,
W79-06932 6A

RESERVOIRS
Factors Governing the Biological Productivity, Regime, and Content of Biogenic and Organic Substances in the Sequence of Dnepr Reservoirs,
W79-06614 5B

Tropical Disease Bilharzia and Irrigation Systems in Puerto Rico,
W79-06671 5G

On Pressure-Work, Viscous Dissipation and the Energy Balance Relation for Geothermal Reservoirs,
W79-06924 2H

RESINS
Industrial Process Profiles for Environmental Use: Chapter 10. Plastics and Resins Industry,
W79-06986 5B

RESISTANCE
Temperature Tolerance of Larval Muskellunge (Esox Masquinongy Mitchell) and F1 Hybrids Reared Under Hatchery Conditions,
W79-06530 5C

RESOURCES
South Coastal Water Quality Management Plan, 1975.
W79-06543 5G

RESOURCES DEVELOPMENT
Environmental Assessment of the Alaskan Continental Shelf. Quarterly Reports of Principal Investigators July - September 1978, Volume I.
W79-06510 5C

Environmental Assessment of the Alaskan Continental Shelf. Quarterly Reports of Principal Investigators July - September 1978. Volume II.
W79-06511 5B

Environmental Assessment of the Alaskan Continental Shelf. Quarterly Reports of Principal Investigators October - December 1978. Volume I.
W79-06512 5C

Environmental Assessment of the Alaskan Continental Shelf. Quarterly Reports of Principal Investigators October - December 1978. Volume II.
W79-06513 5B

Summary of Potential Hazards and Engineering Constraints, Proposed OCS Lease Sale No. 48, Offshore Southern California,
W79-06515 5B

Environmental Hazards: Considerations for Outer Continental Shelf Development,
W79-06529 5B

RESPIRATION
Evaluation of an Automated Biological Monitoring System at an Industrial Site,
W79-06721 5A

TOC, ATP and Respiration Rate as Control Parameters for the Activated Sludge Process,
W79-06976 5D

REVEGETATION
An Approach to the Classification of Utah Mine Spoils and Tailings Based on Surface Hydrology and Erosion,
W79-06844 5A

REVERSE OSMOSIS
Design Study of a Reverse Osmosis Plant for Sea Water Conversion,
W79-06575 3A

Research on Saline Water Conversion by Freezing and Reverse Osmosis,
W79-06577 3A

Design and Construction of a Desalination Pilot Plant, (A Reverse Osmosis Process).
W79-06579 3A

Separations Processes,
W79-06581 3A

A Study of Reverse Osmosis Systems for Desalination,
W79-06583 3A

PBI Reverse Osmosis Membrane for Chromium Plating Rinse Water,
W79-06951 5D

RHODESIA
Rates of Weathering and Soil Formation on Granite in Rhodesia,
W79-06741 2A

RICE
Water Balance of Flooded Rice Paddies,
W79-06713 2I

RILL EROSION
Erosion Inventory-Sheet and Rill Erosion,
W79-06551 2J

RISKS
An Introduction to the Oilspill Risk Analysis Model,
W79-06523 5B

Western Gulf of Alaska Seismic Risk,
W79-06527 5B

A Sea-Floor Seismic Monitoring Network Around an Offshore Oilfield Platform and Recording of the August 13, 1978 Santa Barbara Earthquake,
W79-06528 5B

Environmental Hazards: Considerations for Outer Continental Shelf Development,
W79-06529 5B

RIVER BASINS
South Coastal Water Quality Management Plan, 1975.
W79-06543 5G

RIVER BEDS
New Interpretation of Some Head Loss-Flow Velocity Relationships for Deformable Movable Beds,
W79-06760 2E

RIVER DEE (WALES)
The Measurement of Interactive Freshwater and Tidal Flows in the River Dee, North Wales,
W79-06747 2L

RIVER FLOW
New Interpretation of Some Head Loss-Flow Velocity Relationships for Deformable Movable Beds,
W79-06760 2E

RIVER SYSTEMS
Water Quality in River Systems: Monte-Carlo Analysis,
W79-06935 6A

RIVERS
The Measurement of Interactive Freshwater and Tidal Flows in the River Dee, North Wales,
W79-06747 2L

Experimental Numerical Simulation of Unsteady Water Flow in a Multibranch River Delta,
W79-06749 2L

Steady-State Dissolved Oxygen Model of the Willamette River, Oregon,
W79-06818 5G

Biological and Microbiological Assessment of the Upper Chattahoochee River Basin, Georgia,
W79-06819 5C

Physical-Geographic and Hydrologic Description of the Test Site in the USSR (Mountain Region of the Syrdar'ya River Basin in the Northern Part of the Fergana Depression) and Data on Ground Hydrologic, Meteorologic, and Actinometric Measurements,
W79-06878 2A

ROOT SYSTEMS
An Attempt at Experimental Validation of Macroscopic-Scale Models of Soil Moisture Extraction by Roots,
W79-06745 2G

Economic Analysis, Root Control, and Backwater Flow Control as Related to Infiltration/Inflow Control,
W79-06952 8A

ROTATING BIOLOGICAL CONTACTOR
Evaluation of the RBC Process for Municipal Wastewater Treatment,
W79-06872 5D

ROTATING OPEN CHANNEL
Flow in a Bend in a Rotating Open Channel,
W79-06759 8B

ROUND INTAKE
Supercritical Withdrawal from Two-Layered Fluid Systems, Part 2: Three-Dimensional Flow into Round Intake,
W79-06767 2H

RUNOFF
Surface Storage on Bedded Cultivated Lands,
W79-06503 2G

Input-Output Model for Runoff-Sediment Yield Processes,
W79-06617 2J

To Mark Sampling Events on a Runoff Hydrograph,
W79-06697 7B

Sizing Tailwater Recovery Systems to Utilize Runoff from Precipitation on Irrigated Lands,
W79-06733 4A

Harvesting Runoff from Precipitation on Irrigated Lands,
W79-06734 4A

Runoff Evaluation of Catchments at Granite Reef,
W79-06832 4A

Man, Runoff and the Erosion of the Coastal Slopes of Ashkelon, Israel,
W79-06838 2J

RURAL AREAS
Botswana and Malawi Rural Water Supplie.
W79-06724 8A

RUSAPE WATERSHED (RHODESIA)
Rates of Weathering and Soil Formation on Granite in Rhodesia,
W79-06741 2A

SAGUENAY FJORD
Carbon and Oxygen Isotope Ratios in the Saguenay Fjord and the St. Lawrence Estuary and their Implications for Paleoenvironmental Studies,
W79-06654 2L

SAINT-FRANCIS RIVER
Accuracy Evaluation in the Calculation of Mass-Discharges,
W79-06619 5B

SALINE WATER
Grapefruit Response to Variable Salinity in Irrigation Water and Soil,
W79-06841 2I

SALINE WATER-FRESHWATER INTERFACES
Approximate Analysis of Upconing,
W79-06920 2F

SALINITY
Minimizing Salt in Drain Water by Irrigation Management--Design and Initial Results of Arizona Field Studies,
W79-06700 3F

Temperature Fine Structure Near the Sea-Ice Margin of the Chukchi Sea,
W79-06739 2L

Reducing Salt Pickup from Irrigated Lands,
W79-06937 3F

SALINITY CONTROL
Optimization of Salinity Control in Grand Valley,
W79-06936 6A

SALINITY DISTRIBUTION
Approximate Analysis of Upconing,
W79-06920 2F

SALTATION
Investigation of the Probabilistic Regularities of Saltation of Solid Particles in a Turbulent Flow,
W79-06610 2J

SALTS
Water and Salt Movement in Unsaturated Frozen Soil: Principles and Field Observations,
W79-06744 2G

SALTY TOLERANCE
Corn Production as Influenced by Irrigation and Salinity - Utah Studies,
W79-06860 2I

SAMPLING
New Approaches to the Preservation of Contaminants in Water Samples,
W79-06545 5A

Statistical Analysis of the 1975 Intercomparison Study on Lake Erie,
W79-06601 2H

Ionic Stability of Precipitation Samples,
W79-06602 2K

SANITARY SEWERS
Economic Analysis, Root Control, and Backwater Flow Control as Related to Infiltration/Inflow Control,
W79-06952 8A

SATELLITES (ARTIFICIAL)
Satellites as an Aid to Water Resource Managers,
W79-06505 2C

The Use of LANDSAT DCS and Imagery in Reservoir Management and Operation,
W79-06762 4A

Satellite Surveillance of Physical Water-Quality Characteristics,
W79-06829 7B

Practical Methods of Aiming Antennas at Geostationary Satellites,
W79-06851 7B

SATURATION
On the Approximation of Saturation Vapor Pressure,
W79-06826 7B

SCHISTOSOMIASIS
Tropical Disease Bilharzia and Irrigation Systems in Puerto Rico,
W79-06671 5G

SCOTT COUNTY (IL)
Public Groundwater Supplies in Morgan and Scott Counties,
W79-06768 7C

SEA ICE
Temperature Fine Structure Near the Sea-Ice Margin of the Chukchi Sea,
W79-06739 2L

An Experimental Study of Brine Drainage and Convection in Young Sea Ice,
W79-06757 2C

SEALING
Investigation of Calcium Sulfate Precipitation,
W79-06578 3A

SEASONAL
Time as a Factor in Biomonitoring Estuarine Systems with Reference to Benthic Macrophytes and Epibenthic Fishes and Invertebrates,
W79-06719 5A

Seasonal Succession of Phytoplankton in Roosevelt Lake, Arizona,
W79-06845 2H

Plant Evaluation at Fishing Bridge Wastewater Treatment Plant, Yellowstone National Park,
W79-06997 5D

SEDIMENT DISTRIBUTION
Sediment Sizes Eroded from Rowcrop Sideslopes,
W79-06547 2J

SEDIMENT LOAD
Present and Potential Sediment Yields in the Yampa River Basin, Colorado and Wyoming,
W79-06825 2J

SEDIMENT TRANSPORT
Evaluation of Grass Characteristics Related to Sediment Filtration,
W79-06549 2J

Investigation of the Probabilistic Regularities of Saltation of Solid Particles in a Turbulent Flow,
W79-06610 2J

Estimating Sediment Transport in a Braided Gravel Channel--The Kawerong River, Bougainville, Papua New Guinea,
W79-06618 2J

Investigation of the Speed of Bed Load Movement,
W79-06751 2J

Evaluation and Correlation of Water-Quality Data for the North Fork Flathead River, Northwestern Montana,
W79-06816 5B

Present and Potential Sediment Yields in the Yampa River Basin, Colorado and Wyoming
W79-06825 2J

SEDIMENT YIELD
Input-Output Model for Runoff-Sediment Yield Processes,
W79-06617 2J

Present and Potential Sediment Yields in the Yampa River Basin, Colorado and Wyoming,
W79-06825 2J

SEDIMENTATION
The Intrusion of Fine Sediments into a Stable Gravel Bed,
W79-06643 2J

SEDIMENTS
Chemical Loadings to Southwestern Lake Superior from Red Clay Erosion and Resuspension,
W79-06599 2H

Investigation of the Probabilistic Regularities of Saltation of Solid Particles in a Turbulent Flow,
W79-06610 2J

Effects of Oilfield Brine Effluent on Sediments and Benthic Organisms in Trinity Bay, Texas,
W79-06665 5C

Surficial Sediments,
W79-06690 5B

Supplying Data to Users,
W79-06853 2A

Results of an Algal Toxicity Test Applied to Sediment Elutriates,
W79-06992 5B

SEEPAGE
Natural Gas Seepage on the South Texas Shelf,
W79-06517 5B

Transient Seepage Analysis of Guri Dam,
W79-06587 8A

SEISMIC STUDIES
Western Gulf of Alaska Seismic Risk,
W79-06527 5B

A Sea-Floor Seismic Monitoring Network Around an Offshore Oilfield Platform and Recording of the August 13, 1978 Santa Barbara Earthquake,
W79-06528 5B

SELECTIVE WITHDRAWAL
Supercritical Withdrawal from Two-Layered Fluid Systems, Part 1: Two-Dimensional Skimmer Wall,
W79-06766 2H

Supercritical Withdrawal from Two-Layered Fluid Systems, Part 2: Three-Dimensional Flow into Round Intake,
W79-06767 2H

SEPARATION TECHNIQUES
Two-Stage Oil Skimmer Separator,
W79-06627 5D

Separating Device to Separate Two Liquids of Different Specific Gravity,
W79-06628 5G

Slotted Baffle for Use in Separating Oil-Water Mixtures,
W79-06629 5G

Removal of Heavy Metals from Industrial Wastewaters Using Insoluble Starch Xanthate,
W79-06964 5D

Field Protype Demonstration of the Swirl Degritter,
W79-06977 5D

SEPTIC TANK EFFLUENT
Evapotranspiration Bed Design,
W79-06748 2D

SEPTIC TANKS
Treatment and Disposal of Wastes Pumped from Septic Tanks,
W79-06974 5D

SETTLING BASINS
Characterization of Priority Pollutants from a Secondary Lead and Battery Manufacturing Facility,
W79-06541 5D

Industrial Process Profiles for Environmental Use: Chapter 19. The Clay Industry,
W79-06963 5B

SEWAGE DISPOSAL
Planning for Water Quality: 1776 to 1976,
W79-06685 5G

Land Disposal of Sewage Sludge Volume VI (April 1, 1977 - March 31, 1978)
W79-06849 5G

SEWAGE LAGOONS
Water Hyacinths for Upgrading Sewage Lagoons to Meet Advanced Wastewater Treatment Standards: Part II,
W79-06508 5D

Performance Evaluation of an Existing Seven Cell Lagoon System,
W79-06968 5D

SEWAGE SLUDGE
Effects of Sewage Sludge on the Benthic Invertebrate Community of the Inshore New York Bight,
W79-06656 5A

Phosphate Fertilizer and Sewage Sludge Use on Agricultural Land - The Potential for Cadmium Uptake by Crops,
W79-06852 5G

Natural Freeze-Thaw Sewage Sludge Conditioning and Dewatering,
W79-06854 2D

Disposal of Sewage Sludge into a Sanitary Landfill,
W79-06965 5E

SEWAGE TREATMENT
Development and Present Condition of Sewage Treatment and Utilization in Berlin,
W79-06546 5D

Study on the Effectiveness of Disinfecting Sewage Containing Tuberculosis Bacilli Without Biological Treatment,
W79-06584 5D

Method for the Treatment of Sea Discharged Sewage,
W79-06623 5D

Ozone Disinfection in Waste Water Treatment with Recycling of Ozonation Off Gas,
W79-06624 5D

Process for the Hygienic Elimination of Sewage Containing Salt-Containing Organic Substances,
W79-06625 5D

Planning for Water Quality: 1776 to 1976,
W79-06685 5G

Proceedings, Fifth United States/Japan Conference on Sewage Treatment Technology,
W79-06779 5D

Effect of Upgrading a Municipal Wastewater Effluent on Pollution Indicator and Other Microorganisms in River Water,
W79-06856 5B

Des Moines 208 Areawide Waste Treatment Management Plan.
W79-06981 5D

Actinomycetes of Sewage-Treatment Plants,
W79-06982 5D

SEWERAGE
Sewer System Evaluation, Rehabilitation and New Construction A Manual of Practice,
W79-06506 8A

Regional Sewerage Planning by Mixed Integer Programming,
W79-06542 6A

Sewer Infiltration and Inflow Control Product and Equipment Guide,
W79-06980 8A

Des Moines 208 Areawide Waste Treatment Management Plan.
W79-06981 5D

SEWERS
Sewer System Evaluation, Rehabilitation and New Construction A Manual of Practice,
W79-06506 8A

Evaluation of Trenchless Sewer Construction at South Bethany Beach, Delaware,
W79-06783 8A

Economic Analysis, Root Control, and Backwater Flow Control as Related to Infiltration/Inflow Control,
W79-06952 8A

Control of Sewer Overflows by Polymer Injection,
W79-06973 8A

SHALLOW WATER
Two-Dimensional Shallow Water-Wave Models,
W79-06588 8B

SHEAR STRENGTH
Residual Strength Test, Paraitinga and Paraibuna Dams, Brazil,
W79-06879 8A

SHORE PROTECTION
Man, Runoff and the Erosion of the Coastal Slopes of Ashkelon, Israel,
W79-06838 2J

SIMULATION ANALYSIS
Irrigation Planning Based on Water Deficits,
W79-06797 6B

Evaluation of Hydrologic Modeling Techniques for Forest Land Management Planning,
W79-06801 2E

Simulation of Groundwater Flow and Mass Transport Under Uncertainty,
W79-06922 2F

Water Quality in River Systems: Monte-Carlo Analysis,
W79-06935 6A

Optimization of Salinity Control in Grand Valley,
W79-06936 6A

SITES
Location of Municipal Well Fields in an Environmentally Sensitive Region,
W79-06855 6B

SKIMMER WALL
Supercritical Withdrawal from Two-Layered Fluid Systems, Part 1: Two-Dimensional Skimmer Wall,
W79-06766 2H

SLUDGE
Sorbents for Fluoride, Metal Finishing, and Petroleum Sludge Leachate Contaminant Control,
W79-06873 5D

Handling and Disposal of Sludges from Combined Sewer Overflow Treatment: Phase III--Treatability Studies,
W79-06946 5D

SLUDGE DISPOSAL
Air Pollution Aspects of Sludge Incineration.
W79-06540 5D

Effects of Sewage Sludge on the Benthic Invertebrate Community of the Inshore New York Bight,
W79-06656 5A

Recent Developments in the Sandia Laboratories' Sewage Sludge Irradiation Program,
W79-06782 5D

Impact of Wastes from a Water Treatment Plant: Evaluative Procedures and Results,
W79-06889 5E

Sewage Sludge Entrenchment System for Use by Small Municipalities,
W79-06947 5E

Des Moines 208 Areawide Waste Treatment Management Plan.
W79-06981 5D

Municipal Sludge Management Environmental Factors.
W79-06998 5E

SLUDGE TREATMENT
Recent Developments in the Sandia Laboratories' Sewage Sludge Irradiation Program,
W79-06782 5D

Handling and Disposal of Sludges from Combined Sewer Overflow Treatment: Phase III--Treatability Studies,
W79-06946 5D

Pilot Investigation of Secondary Sludge Dewatering Alternatives,
W79-06948 5D

Pretreatment and Substrate Evaluation for the Enzymatic Hydrolysis of Cellulosic Wastes,
W79-06995 5D

Strong Oxidant Conditioning of Allentown Wastewater Sludge,
W79-06996 5E

SLURRIES
Characterization of Priority Pollutants from a Secondary Lead and Battery Manufacturing Facility,
W79-06541 5D

SMALL WATERSHEDS
Effects of Drainage Projects on Surface Runoff from Small Depressional Watersheds in the North Central Region,
W79-06729 2E

SNOW
On Heat and Mass Flux Through Dry Snow,
W79-06585 2C

SNOW COVER
The Use of LANDSAT DCS and Imagery in Reservoir Management and Operation,
W79-06762 4A

Snow Survey and Vegetation Growth in the Swiss Alps,
W79-06764 7B

SNOWMELT
Support Observations for Weather Modification Operations in the San Juan Mountains and a Procedure for Estimating Snowpack Runoff,
W79-06940 2A

SNOWPACKS
Support Observations for Weather Modification Operations in the San Juan Mountains and a Procedure for Estimating Snowpack Runoff,
W79-06940 2A

STRAIT OF GEORGIA (BRITISH COLUMBIA)
Fluctuations of Chlorophyll and Related Physical Parameters in British Columbia Coastal Waters,
W79-06644 2L

STRAITS
Fluctuations of Chlorophyll and Related Physical Parameters in British Columbia Coastal Waters,
W79-06644 2L

STRATIFIED FLOW
On the Numerical Computation of Two-Layer Nearly Horizontal Flows,
W79-06758 2E

Supercritical Withdrawal from Two-Layered Fluid Systems, Part 1: Two-Dimensional Skimmer Wall,
W79-06766 2H

Supercritical Withdrawal from Two-Layered Fluid Systems, Part 2: Three-Dimensional Flow into Round Intake,
W79-06767 2H

STREAMBEDS
The Intrusion of Fine Sediments into a Stable Gravel Bed,
W79-06643 2J

STREAMFLOW
Simulated Streamflow Response to Possible Differences in Transpiration Among Species of Hardwood Trees,
W79-06705 2A

Synthesis of Flow-Duration Curves for Unregulated Streams in New Hampshire,
W79-06725 2E

Evaluation and Correlation of Water-Quality Data for the North Fork Flathead River, Northwestern Montana,
W79-06816 5B

Present and Potential Sediment Yields in the Yampa River Basin, Colorado and Wyoming,
W79-06825 2J

Supplying Data to Users,
W79-06853 2A

Physical-Geographic and Hydrologic Description of the Test Site in the USSR (Mountain Region of the Syrdar'ya River Basin in the Northern Part of the Fergana Depression) and Data on Ground Hydrologic, Meteorologic, and Actinometric Measurements,
W79-06878 2A

STREAMS
Relationships Between Concentrations and Discharge on Selected Illinois Streams,
W79-06737 5B

STRESS
Further Studies on the Effects of Stress in the Adult on the Eggs of Mytilus Edulis,
W79-06857 5C

STRIP MINES
A Drainage Model for a Reclaimed Surface Mine,
W79-06743 4A

SUBLETHAL EFFECTS
Some Monitoring and Analytical Techniques for the Study of Locomotor Responses of Fish to Environmental Variables,
W79-06717 5A

SUBSURFACE WATERS
Observations of the Subsurface Water Regime in the Territory of Czechoslovakia,
W79-06609 2F

SUCCESSION
Seasonal Succession of Phytoplankton in Roosevelt Lake, Arizona,
W79-06845 2H

SULFATES
Research on Mineral By-Products from Saline Waters,
W79-06573 3A

On the Concentration of Sulfate in Precipitation,
W79-06592 5B

SULFIDES
Combined Measurement of Oxygen and Sulfide in Water Samples,
W79-06699 2K

Removal and Recovery of Sulfide from Tannery Wastewater.
W79-06999 5D

SURF
Concentrations and Temporal Variations of 210PO, 210PB, and Al in the Surf Zone Ecosystem of Copalis Beach, Washington,
W79-06655 2L

SURFACE-GROUNDWATER RELATIONSHIPS
Runoff Rainfall Analysis for Bare Soils,
W79-06837 2E

SURFACE IRRIGATION
Describing Irrigation Efficiency and Uniformity.
W79-06648 3F

SURFACE RUNOFF
Effects of Drainage Projects on Surface Runoff from Small Depressional Watersheds in the North Central Region,
W79-06729 2E

Runoff Rainfall Analysis for Bare Soils,
W79-06837 2E

SURFACE SEALING
Runoff Evaluation of Catchments at Granite Reef,
W79-06832 4A

Water Harvesting Agrisystem to Grow Jojoba on Developed Idle Farmland,

VON ROLL A. G., GERLAFINGEN (SWITZERLAND). (ASSIGNEE).
Process for the Hygienic Elimination of Sewage Containing Salt-Containing Organic Substances,
W79-06625 5D

WASHINGTON STATE DEPT. OF NATURAL RESOURCES, OLYMPIA.
Evaluation of Hydrologic Modeling Techniques for Forest Land Management Planning,
W79-06801 2E

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF AGRICULTURAL ECONOMICS.
A Planning Study for Irrigation Development in Washington. Volume I, Executive Summary.
W79-06544 4B

WASHINGTON UNIV., SEATTLE.
Water Resources Systems Planning in U.S.A.: 1776-1976,
W79-06683 6A

WASHINGTON UNIV., SEATTLE. DEPT. OF OCEANOGRAPHY.
Concentrations and Temporal Variations of 210PO, 210PB, and Al in the Surf Zone Ecosystem of Copalis Beach, Washington,
W79-06655 2L

An Experimental Study of Brine Drainage and Convection in Young Sea Ice,
W79-06757 2C

WASHINGTON UNIV., SEATTLE. DIV. OF MARINE RESOURCES.
Shorelines Management '77: Performance and Prospects.
W79-06786 6G

WASHINGTON UNIV., SEATTLE. FISHERIES RESEARCH INST.
Operational Effects of Irrigation and Pumped Storage on the Ecology of Banks Lake, Washington,
W79-06942 2H

WATER RESOURCES COUNCIL, WASHINGTON, DC.
Water Resources Policy Study: Working Drafts of the Task Force Reports,
W79-06776 6B

WATERLOO UNIV. (ONTARIO). DEPT. OF SYSTEMS DESIGN.
Evaluation of Alternatives to the Garrison Diversion Unit,
W79-06798 6B

Fuzzy Set Approaches to Planning in the Grand River Basin,
W79-06809 6B

WELSH NATIONAL WATER DEVELOPMENT AUTHORITY, CARDIFF. DEE AND CLWYD SEWAGE DIV.
The Measurement of Interactive Freshwater and Tidal Flows in the River Dee, North Wales,
W79-06747 2L

WESTERN WEATHER CONSULTANTS, INC., DURANGO, CO.
Support Observations for Weather Modification Operations in the San Juan Mountains and a Procedure for Estimating Snowpack Runoff,
W79-06940 2A

WESTGATE RESEARCH CORP., LOS ANGELES, CA.
Development Effort to Design and Describe Pink Water Abatement Processes,
W79-06978 5D

WESTON ENVIRONMENTAL CONSULTANTS-DESIGNERS, WEST CHESTER, PA.
Multiple Water Supply Approach for Urban Water Management,
W79-06537 6A

WISCONSIN UNIV.-MILWAUKEE. CENTER FOR GREAT LAKES STUDIES.
Low-Frequency Current Fluctuations in Lake Ontario, Winter 1972-1973 (IFYGL),
W79-06756 2H

WISCONSIN UNIV.-SUPERIOR. DEPT. OF CHEMISTRY.
Chemical Loadings to Southwestern Lake Superior from Red Clay Erosion and Resuspension,
W79-06599 2H

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MA.
Some Biochemical and Physiological Aspects of Growth and Gametogenesis in Crassostrea Gigas and Ostrea Edulis Grown at Sustained Elevated Temperatures,
W79-06958 5C

WRIGHT WATER ENGINEERS, INC., DENVER, CO. GROUND WATER DIV.
Ground-Water Computer Models - Practical Tools,
W79-06908 7C

YPSILANTI TOWNSHIP, MI.
Effects of Flow Equalization on the Operation and Performance of an Activated Sludge Plant,
W79-06972 5D

ZURICH UNIV. (SWITZERLAND). DEPT. OF GEOGRAPHY.
Snow Survey and Vegetation Growth in the Swiss Alps,
W79-06764 7B

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 12, NUMBER 15
AUGUST 1, 1979

W79-07001--W79-07500
CODEN:SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 12, NUMBER 15
AUGUST 1, 1979

W79-07001--W79-07500

The Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

DETERMINATION OF SULFATE IN SEAWATER AND NATURAL BRINES BY 133BA AND MEMBRANE DIALYSIS,
Geological Survey, Menlo Park, CA.
R. J. Rosenbauer, J. L. Bischoff, and W. E. Seyfried.
Limnology and Oceanography, Vol. 24, No. 2, p 393-396, March 1979. 2 tab, 11 ref.

Descriptors: *Sea water, *Water properties, *Methodology, *Sulfates, Laboratory tests, Chemical properties, Instrumentation, Salinity, Analytical techniques, Analysis, Radiochemical analysis, Barium, Radioisotopes, Membrane processes, Dialysis, Measurement, Brines.

Dissolved sulfate is determined by precipitation with the radioisotope 133Ba and counting of the precipitate on a scintillation counter. Precipitation is carried out in dialysis bags; excess 133Ba is removed via diffusion by soaking the bags in distilled water for 12 h, and the bags are then placed directly in the well of the scintillation counter. The procedure eliminates previous errors caused by washing and transferring of the precipitate and permits analysis of 0.5-3,000 microgram/ml sulfate in a 1.0-ml sample. The detection limit is increased by simply increasing the sample volume up to 5.0 ml. The technique is interference-free in natural waters ranging from freshwater to brines of 1.5 times the salinity of seawater. (Humphreys-ISWS)

THE DENSITY AND SPEED OF SOUND OF ORCA BASIN WATERS,
Rosenstiel School of Marine and Atmospheric Science, Miami, FL.
F. J. Millero, A. L. Surdo, P. Chetirkin, and N. L. Guinasso, Jr.
Limnology and Oceanography, Vol. 24, No. 2, p 218-225, March 1979. 3 fig, 8 tab, 18 ref. ONR N00014-75-0173, NSF CE73-00351-A01, NSF OCE 77-21009, ONR N00014-75-0537.

Descriptors: *Sea water, *Water properties, *Laboratory tests, *Gulf of Mexico, Salinity, Acoustics, Density, Water temperature, Water sampling, Evaporation, Analysis, Analytical techniques, Saline water, Brines, Conductivity.

The composition of samples of waters collected in the Orca depression (Gulf of Mexico) above and below the seawater-brine interface was characterized by measuring chlorinity (Cl) and salinity (S). The ratio of S:Cl = 1.6823 in the brines, compared with 1.6817 calculated from composition data. Densities and sound speeds of the waters were measured at 15C, 25C, and 35C and the results were fitted to chlorinity functions. The standard deviations in density are approximately 0.000060 g/cu m, in sound speed approximately 1.2 m/s. These standard errors are about 6 times larger than the precision of the measurements and are due to errors in determining Cl and to changes in the brine composition across the interface. Conductivity, density, and sound speed were measured in weight-diluted brine samples, and the results were used to calculate the relationship of evaporation salinity to salinity calculated from measurements on standard seawater. The differences in evaporation salinity and S determined from properties of standard seawater are caused by hydration changes in the major constituents. The measured brine densities were compared with values calculated by using an additivity method and the known composition of the waters and agreed to within + or - 0.000280 g/cu m over the temperature range measured. THE EFFECT OF NEUTRALIZATION OF THE ANAESTHETIC MS 222 ON FRESHWATER QUALITY,
Randes Afrikaanse Univ., Johannesburg (South Africa). Dept. of Zoology.
G. L. Smit, P. S. J. Halliday, and J. Hattingh.
Journal of the Limnological Society of Southern Africa, Vol. 4, No. 1, p 31-34, July 1978. 1 fig, 3 tab, 6 ref.

Descriptors: *Fresh water, *Water quality, *Anesthetic, *Neutralization, Alkalinity, Hydrogen ion concentration, Ammonia, Calcium, Sulfate, Nitrogen, Hardness, Water types, Conductivity.

The quality of fresh water with different mineral contents was studied with regard to the long and short term effects of the fish anesthetic Tricaine methanesulphonate (MS 222) and the effect of neutralizing this anesthetic with NaOH. Varying concentrations of MS 222 were dissolved in distilled water and titrated against equimolar solutions of NaOH to a pH beyond the neutral point of the solute. Concentrations of MS 222 were added to aged tapwater, borehole water and distilled water. Values were measured in duplicate for pH, pO2, pCO2, alkalinity, calcium hardness, sulfate, nitrogen, and chloride. The results indicate the MS 222, acidic in nature, causes changes in pH, pCO2, alkalinity, and calcium hardness levels in tapwater and borehole water. Conductivity and pH changes were shown in distilled water; borehole water conductivity was not affected. Conductivity increased in tapwater with increased MS 222 concentrations. Neutralization of MS 222 prevents any changes, except for conductivity, in these parameters. It is suggested that neutralization produces a safer, more effective anesthetic. (Davison-IPA)

HYDROLOGY AND CHEMICAL QUALITY OF FLOW FROM SMALL PASTURED WATERSHEDS: I. HYDROLOGY,
Ohio Agriculture Research and Development Center, Wooster.
R. W. Van Keuren, J. L. McGuinness, and F. W. Chichester.
Journal of Environmental Quality, Vol. 8, No. 2, p 162-166, April-June 1979. 2 fig, 5 tab, 13 ref.

Descriptors: *Hydrology, *Agricultural watersheds, *Water balance, *On-site investigations, *Ohio, Surface runoff, Demonstration watersheds, Pastures, Small watersheds, Precipitation(Atmospheric), Soil moisture, Evapotranspiration, Subsurface flow, Soil erosion, On-site data collections, Pasture management, Grazing, Seasonal.

Surface runoff, soil loss, and subsurface flow were measured from 4 rotationally grazed summer pastures. One of these pastures was also used as a winter-feeding area. Surface runoff volumes and peak rates from the 3 pastures used only for summer grazing were generally less as compared with values for earlier years when the fields were in meadow and light pasturing; however, runoff from the winter-feeding area was markedly increased. Both before and after the initiation of grazing, the areas used only for summer grazing had but a trace of soil loss. More soil was lost from the winter-feeding area, particularly during the dormant season. Water-balance studies indicated that during the growing season, surface runoff and subsurface outflow were higher and evapotranspiration (ET) was less from the winter-feeding area than from areas summer-grazed only. During the dormant season, surface runoff was higher and subsurface outflow was lower from the winter-feeding area than from the summer-grazed areas, whereas ET was similar. ESTIMATE DETENTION RESERVOIR STORAGE,
A. S. Paintal.
Water and Wastes Engineering, Vol. 16, No. 5, p 98-99, May 1979. 3 fig.

Descriptors: *Detention reservoirs, *Storage requirements, *Mathematical models, *Storm runoff, Reservoir storage, Hydrograph analysis, Rainfall intensity, Model studies, Time of concentration, Design, Routing, Estimating equations, Inflow, Surface runoff, Analytical techniques.

A simplified procedure was presented for estimating detention reservoir storage as governed by the characteristics of drainage area and the maximum allowable outflow rate. The models presented are based upon the following assumptions: (1) The rainfall intensity-duration relationship can be expressed as $I = a/(b + T)$ where I is rainfall intensity, in/hr, a and b are constants, and T is duration of rainfall in minutes; (2) The storms with durations longer than the time of concentration, t, for the drainage area produce larger volumes of run-off even though the peak flow rates are reduced; (3) The inflow hydrograph was taken to be of trapezoidal form and, the peak rate of run-off is given by the rational formula; (4) The rising and receding limbs of inflow hydrograph are equal to the time of concentration t; (5) The area under the inflow hydrograph represents the total volume of storm run-off and is equal to the peak rate of run-off multiplied by the storm duration. QUANTITATIVE MORPHOLOGY OF LANDFORMS IN CARBONATE ROCK BASINS IN THE APPALACHIAN HIGHLANDS,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
E. L. White, and W. B. White.
Geological Society of America Bulletin, Pt. I, V. 90, p 385-396, April 1979. 12 fig, 6 tab, 30 ref. OWRT B-046-PA (4), 14-31-001-3638.

Descriptors: *Karst, Topography, Carbonate rocks, *Drainage basins, Dolomite, Calcite, Caves, Groundwater, Streamflow, Limestones, Aquifers, Sediment load, Applachian Highlands, Dolines, Sinkholes, Clastic rocks, Catchments, Ordovician carbonate rocks.

Karst topography occurs in the Appalachian Highlands where carbonate rocks are exposed. The principal landforms are sinking streams, dolines, and caves. Landform measures were devised for the drainage features and for dolines and applied to 62 small basins between Pennsylvania and Ala-

bama. Karst measures included carbonate rock fractions, measures of doline development, and measures of internal drainage. Factor analysis showed that the 15 measures contained only five independent variables. Various stream length measures are related to the basin area in much the same way as streams in noncarbonate basins showing the fluviokarst character of the Appalachian basins. Sinking stream length, SINKL, relates to the area of the sinking stream catchment, AB, by SINKL = 2.29 AB0.85. Doline karst was measured by either the area of internal drainage into dolines, AD, or by the number of dolines, N, per unit area of carbonate rock. These measures are related by AD = 0.0136 N1.17. The frequency of occurrence of dolines falls off exponentially with depth independent of rock type or structural setting. Comparison of several measures of karst in relation to rock type shows smallest and fewest dolines in the Ordovician dolomites and an intermediate size and number in the Ordovician limestones. The largest and most numerous dolines occur in the flat-lying Mississippian limestones of the Applachian Plateau. This result may be an expression of the more sluggish solution kinetics of dolomite compared to calcite. (Tsong-Penn State)
W79-07252

HYDROGRAPHIC PROJECT,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
N. P. Smith, J. Evans, and W. MacNaughton.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol. I,' p 2-1 - 2-130, January 15, 1979. 84 fig, 5 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Hydrography, *Seasonal, *Variability, Environmental effects, Resources development, Texas, *Outer Continental Shelf, *Current measurements, Petroleum development, South Texas Outer Continental Shelf(STOCS).

Recording current meter data from two field experiments, and hydrographic data from nine nearly synoptic cruises over the South Texas Outer Continental Shelf were used to describe the annual progression of physical oceanographic variables for 1977, and to infer the dominant time scales and external forcing mechanisms. Current measurements revealed a strong longshore transport to the south-southwest during the winter months and little net transport during the summer. Surface temperature data indicated a transition from strong cross-shelf gradients in the winter to nearly isothermal conditions in summer. Salinity variations were largely restricted to the transient decrease produced by the spring runoff. The principal external forcing mechanisms appeared to be the winter cold fronts, the spring runoff and summer heating. (See also W79-07287) (Sinha-OEIS)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-293 516, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA-600/3-79-015, February 1979. 101 p, 44 fig, 10 tab, 23 ref, 1 append.

Descriptors: *Hydrodynamics, *Mathematical models, *Sea of Azov(U.S.S.R.), *Lake Baikal(U.S.S.R.), *Saginaw Bay(Michigan), Equations, Mass, Conservation, Energy, Momentum equation, Methodology.

As part of the U.S.A./U.S.S.R. Agreement on Cooperation in the Field of Environmental Protection, a joint modeling project involving scientists from both countries was accomplished. Three geographical areas were investigated: Lake Baikal and the Sea of Azov in the U.S.S.R. and Saginaw Bay, Lake Huron in the U.S. The three modeling approaches were: (1) hydrodynamic modeling using conservation equations for mass, energy, and momentum; (2) transport modeling using mass construction (type 1); and (3) transport modeling using conservation of material and water mass as applied to Saginaw Bay (type 2). A general background summary of each of the three bodies of water is followed by a synopsis of the mathematical models. Applications of the models are presented. Comparisons with available data showed reasonable agreement. The hydrodynamic model calculation for the Sea of Azov is potentially useful in assessing the effects of hydrologic modifications. It is concluded that the work accomplished is a preliminary step in comprehensive comparison of the modeling methodology in the two countries among researchers for hydrodynamic and biochemical modeling. Descriptors: *Drainage, *Watersheds(Basins), *Drainage systems, *Ditches, *Blue Earth County(Minnesota), *Basic data collections, *Mapping, *Maps, *Topographical mapping, Data collections, Minnesota Land Management Information System, Planning.

An atlas has been developed as a preliminary part of a data base for research and computer simulation modeling of drainage in south central Minnesota. A list of all ditches built in Blue Earth County was compiled, prints were microfilmed from ditch maps found in the county court house, and the individual prints were superimposed on seven and one-half minute United States Geological Survey (U.S.G.S.) Topographic Maps. Tracings were made from original maps for ditches not on microfilm, and then superimposed onto the topographical maps. Ditchsheds, riversheds, and lakesheds were determined by relief variations in U.S.G.S. topographical maps for more accurate depictions of true surface hydrology. Tracings were made from the U.S.G.S. maps and then planimetered. The individual township maps and planimetered data were aggregated to obtain the Blue Earth County Composite Map and data base. To compare present surface hydrology to preagricultural conditions in the county enlarged prints of each Congressional Township were obtained from microfilm copies of the 1860 General Land Survey, and the areas of lakes and swamps were traced and planimetered. The Minnesota Land Management Information System (MLMIS) variables of land use, soil landscape unit, geomorphic region and water orientation are to be used in the final simulation of drainage ditches and water quality. THE WATER BALANCE OF MOSCOW,
Akademiya Nauk SSSR, Moscow. Inst. Geografii.
M. I. Lvovich, and G. M. Chernogaeva.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 48-51, 1977. 1 tab, 5 ref.

Descriptors: *Water balance, *Urbanization, *Effects, *Hydrological cycle, *Environment, *Moscow(USSR), River basins, Hydrologic data, Seasonal, Change, Urban areas, Rural areas, Rainfall, Runoff.

The results of water balance estimates are given for the entire Moscow area as well as for the most built-up part within the Sadovoye ring, and the technique of estimation is presented. Water balance data for the urban area are compared with those for the natural Moscow River basin to Zvenigorod. Conclusions are drawn concerning the effect of changes in the water balance of an urban area on the environment. (See also W79-07426) (Bell Graf-Cornell)

EXPERIMENTAL STUDIES OF CHANGES IN THE WATER BALANCE OF AN URBAN AREA,
Akademiya Nauk SSSR, Moscow. Inst. Geografii.
M. I. Lvovich, and E. P. Chernishov.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 63-67, 1977. 1 fig, 1 tab, 8 ref.

Descriptors: *Water balance, *Urbanization, *Effects, *Surface runoff, *Water pollution, Industries, Water resources, Land use, Catchments, Precipitation, Hydrologic cycle, Economic development, Change.

The Institute of Geography of the USSR Academy of Sciences, Moscow, has been conducting studies on water balance changes under urban influences and industrial agglomerations in Kursk. This is a city typical of the European part of the USSR with a population of 300,000. It is one of the economic and cultural centres of the foreststeppe zone. The results of observations on the water balance elements of the urban area are compared with data from earlier similar studies conducted near Kursk in the virgin area of the Central Chernozem Reserve and also on arable land. As a result of these studies, seasonal and yearly water balances were made for the urban area and the water balance changes were estimated. The research is based on a method adopted by the Institute of Geography. (See also W79-07426) (Bell Graf-Cornell)

HORIZONTAL DIVISION OF THE HYDROLOGICAL MODELS FOR A BASIN WITH MAN-MADE INFLUENCES, PARTICULARLY OF URBANIZATION,
Technische Univ., Dresden (German, D.R.). Dept. of Hydrology and Meteorology.
N. Hansel.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 68-78, 1977. 3 fig, 5 tab, 28 ref.

Descriptors: *Hydrologic models, *River basins, *Urbanization, *Effects, *Horizontal division, Man-made influences, Runoff, Methodology, Hydrologic data, Systems analysis.

The problems of the horizontal division of a hydrological model for a catchment with man-made influences are shown for examples of urbanization. A consideration of the possibilities of the horizontal division in using models for basins with man-made influences gives results for the structure of models. Data from three catchments verify the results. The influence of urbanization and industrialization is considerable in these catchments. (See also W79-07426) (Bell Graf-Cornell)

In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 109-123, 1977. 9 fig, 8 tab, 11 ref.

Descriptors: *Surface waters, *Storm water, *Waste water(Pollution), *Sewer systems, *Water quality, *Water quantity, *Digital model, *Nonsteady flow, *Open drains, *Runoff coefficients, *Rainfall, Subsurface waters, Precipitation, Storm drains, Hydrologic data, Discharge(Water), Catchment areas, Outflow, Design, Culverts, Weirs, Measurement, Nash model, Loss distribution, Regression analysis, Equations, Mathematical models, Systems analysis.

A part of the flat urban area (116 ha) of the new town of Lelystad, situated in a recently reclaimed polder in the former Zuiderzee, was the subject of a study on the flow of surface and subsurface water into and through open drains. Precipitation, discharge of storm drains and of subsurface drainage were measured in three catchment areas. From these data, the runoff coefficients and the transformation of the rainfall into outflow from the storm water drains are calculated. These outputs are used for modeling the nonsteady flow through the open drains. This model is applied in the design of urban system open drains, culverts, and weirs. The water quality of the system has also been investigated. From the measurements, it can be concluded that the system of separate storm and waste water sewers produces less water pollution than a combined system with zero overflows. This paper deals with a parameter identification problem for the rainfall-runoff relationship in an urban area. Unit hydrographs have been calculated for areas with different percentages of impervious cover with the aid of measured rainfall and runoff. Two case studies are reported: (1) a sewer district in Enschede with low quality data and (2) some specially equipped catchment areas with high quality in Lelystad, a new town in one of the IJesselmeer polders. These catchment areas include a parking lot, a residential quarter and a shopping center. In the first study, one method, based on Laguerre functions, was applied to calculate unit hydrographs. Four methods were used in the second study and the provisional results compared. First, the Nash cascade was chosen as a model for the rainfall-runoff relationship. The parameters n and k were calculated by moments. Next, some exercises were made with the Fourier transform method. The Nash cascade can be expanded with Laguerre functions. The last method concerns quadratic programming, which minimizes the difference between computed and recorded runoff in the sense of least squares. Besides the influence of the distribution of the losses on the unit hydrograph, the different unit hydrographs have been illustrated for the catchment areas. Finally, as the last stage of modeling, a start has been made in validating the identification methods by the calculation of correlation coefficients. (See also W79-07426) (Bell Graf-Cornell)

RUNOFF CONTROL ON URBANIZING CATCHMENTS,
Canada Centre for Inland Waters, Burlington (Ontario).
J. Marsalek.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 153-161, 1977. 2 fig, 2 tab, 10 ref.

Descriptors: *Urban runoff, *Urban drainage, *Runoff control, *Catchments, *Methodology, *Simulation analysis, Evaluation, Measurement, Design storm, Historical storms, Effects, Size, Imperviousness, Frequency, Hydrologic data, Rainfall-runoff relationships, On-site detention, Mathematical models, Systems analysis.

Recent urban drainage policies frequently stipulate the requirement of zero increase in the runoff peak flow due to the catchment development. Since runoff measurements for either of the catchment states are rarely available, urban runoff models must be used to simulate runoff and to design runoff control measures to meet the policy requirements. A methodology for evaluation of runoff and runoff control measures is demonstrated on an urban test catchment for which extensive rainfall-runoff measurements are available for a postdevelopment stage. These measurements were used to calibrate the Storm Water Management Model of the US Environmental Protection Agency. The model was then used to simulate runoff for the predevelopment stage, the existing stage, and a newly proposed low cost residential development. The simulations were made for historical and design storms of various frequencies. Runoff peaks produced by design storms were up to twice as large as those produced by historical storms of identical frequencies. The volumes of detention storage necessary to maintain the predevelopment runoff peaks were calculated for events of various frequencies of occurrence. Effects of the size and imperviousness of the urbanizing catchment were detected. (See also W79-07426) (Bell Graf-Cornell)

CHARACTERISTICS OF OKLAHOMA HAILFALLS AND HAILSTORMS,
National Severe Storms Lab., Norman, OK.
S. P. Nelson, and S. K. Young.
Journal of Applied Meteorology, Vol. 36, No. 3, p 339-347, March 1979. 6 fig, 7 tab, 26 ref.

Descriptors: *Precipitation(Atmospheric), *Hail, *Storms, *Oklahoma, On-site investigations, Data processing, Weather, Thunderstorms, Rainfall, Winds, Meteorology, Hailfalls, Hailstorms, Severe storms.

Data on point and areal (100-8100 sq km) surface hailfall characteristics were presented for Oklahoma. Data analysis showed that Oklahoma experiences a larger mean hailstone per occurrence than South Africa and a larger mean hailfall area than South Africa or Illinois. Further investigations were made into the parent hailstorms. They were first subdivided using the ordinary/supercell classification system suggested by Browning. The classification system was found to have general utility for central Oklahoma when applied to all observed hailstorms that occurred within an 8100 sq km area over a four-year period. Supercells comprised about 25% of the storms and had a larger mean observed hailstone diameter (4.4 cm) and a larger mean maximum swath width (18.1 km) than the ordinary cell storms (mean value of 1.4 cm and 8.1 km, respectively). These differences in hail production were significant at the 1% level. (Sims-ISWS)

Descriptors: *Rainfall, *Areal, *Precipitation(Atmospheric), Average, Technology, Rain gages, Basins, Isohytes, Gaging stations, Mathematical studies, *Areal average rainfall, *Hypothetical basins, Techniques, Arithmetic mean, Thiessen polygon, Isohyetal method, Basin relief.

A method was developed for allocating an area likely to be shared by a raingage station. Average areal precipitation was found by weighting the rainfall at the gaging station in terms of the product of distances enclosing it or radiating from it. The method was applied to 2 real and 2 hypothetical basins, and the results were compared with those obtained by existing techniques. This method of determining average rainfall is based on reasonable assumptions. If the weight to be given to a particular station is estimated in terms of the product of distances instead of actually measuring the area, the method becomes faster and gives reasonable results. ematical models, Systems analysis, Correlation coefficient.

This research is intended to show the effect of a newly-developed urban area on heavy rainfall distribution as well as to ascertain to what extent the urbanization of part of an experimental basin affects the temporal and spatial distribution of raincells. The study employed an analysis of storm data collected during the summers of 1968-1970. The Little River Experimental Watershed, located near Tifton, Georgia is monitored by a dense network of raingauges covering an area of 650 km2. The results obtained from graphical plots indicated that summer thunderstorms with a precipitation depth of 25 mm or more were initiated earlier on an urban area compared to the surrounding rural area. The frequency of storm occurrences from the year of urbanization and the areal depth of rainfall on the urban area increased with increase of storm depth. Finally, the transformation factor--the mean correlation coefficient--converting point rainfall into areal rainfall was determined in terms of storm area and characteristic distance parameter. The ratio da/do increased with an increase of storm center urban depths from 5 mm to 30 mm or more on the urban area, but it remained constant over the nonurban area. The results from the model study confirm the findings of similar studies carried out recently in this field of research. (See also W79-07426) (Bell Graf-Cornell)

URBAN EFFECTS ON STORM RAINFALL IN MIDWESTERN UNITED STATES,
Illinois State Water Survey. Urbana.
F. A. Huff.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 12-19, 1977. 2 fig, 4 tab, 6 ref.

Descriptors: *Storms, *Rainfall, *Midwestern U.S., *Urban effects, Missouri, Summer, Regional analysis, Networks, Water yield, Computer programs, Hydrology, Seasonal, Comparison, Radar analyses, Industries.

A comprehensive 5-year field and analysis program concerned with urban-induced effects on precipitation was recently completed at St. Louis, Missouri. Data obtained from operation of a network of 225 recording raingauges on 5200 km indicated an increase of approximately 30 percent in summer rainfall in an area which is most frequently exposed to storms crossing the urban-industrial region. This enhancement was most pronounced in heavy rainstorms that produced maxima of 25 mm or more in the network. The average water yield from individual raincells in these storms was over 70 percent greater in urban-exposed cells than in surrounding rural cells. Radar data showed a strong tendency for new raincells to form or for existing cells to intensify over the urban area. This cell enhancement was most pronounced with organized storm systems during the afternoon when solar heating is superimposed upon the man-made heat island. Hydrologically, the 5-year study indicates that the frequency distribution of heavy rainfalls of 5-min to 2-h duration may vary significantly between urban, suburban, and rural areas in large urban-industrial regions, and this variation should be considered in the design and operation of urban hydrological systems. THE DEFORMATION OF PACK ICE BY RIDGING,
Bedford Inst. of Oceanography, Datmouth (Nova Scotia).
G. L. Bugden.
Journal of Geophysical Research, Vol. 84, No. C4, p 1793-1796, April 20, 1979. 4 fig, 1 tab, 7 ref.

Descriptors: *Sea ice, *Mechanical properties, *Mathematical models, *Theoretical analysis, Deformation, Analytical techniques, Model studies, Pressure, Compressive strength, Mathematical studies, Ridging.

Some ideas on modeling the deformation of pack ice by ridging were presented. A theory was proposed which, by assuming a constant shape for ridge sections and coupling the ridge frequency to the mean ridge height, provides a thickness redistribution function related to previously developed statistical ridge models. The characteristics of the ridging are parameterized in terms of a single easily measured variable, the mean ridge height. The lower limit of the compressive strength increases linearly with ridge height even when ice of a uniform thickness is engaging in the ridging process. This point may be of some value of modelers of ice movement. (Humphreys-ISWS)

IMPACT FORCE OF SNOW,
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
R. Perla, T. Beck, and J. Banner.
NHRI Paper No. 2, IWD Scientific Series No. 97, 1978, 8 p, 4 fig, 1 ref, 2 tab.

Descriptors: *Snow, *Avalanches, *Density, *Temperature, Model studies, *Alberta, *Banff National Park, Portable storage oscilloscope, Impact pressure.

Cylindrical blocks of snow (mass 20 to 50 kg) were dropped from a height of 10 m onto a circular aluminum plate (thickness 25 mm). Impact forces were measured by load cells and recorded on magnetic tape. For a 50-kg mass, the peak force was 28 kN, occurring about 7 ms after initiation of impact, and decaying to 14 kN in an additional 17 ms. The impact force as a function of time could be represented by an equation which was derived by assuming that the centre of mass of the sample (mass M) decelerates from an impact speed V sub o to rest in a distance d within a force field proportional to sample compression and velocity of compression. The 10-m drop height induced a speed (V sub o equals 13.5 m per s) that was sufficient to flatten and disaggregate the samples. Prediction of F(t) based on assuming d equal to half the sample height is in agreement with measured values. (WATDOC)

2E. Streamflow and Runoff

RED CEDAR RIVER BASIN, WISCONSIN: LOW-FLOW CHARACTERISTICS,
Geological Survey, Madison, WI. Water Resources Div.
W. A. Gebert.
Geological Survey Water-Resources Investigations 79-29 (open-file report), March 1979. 12 p, 2 fig, 1 plate, 1 tab, 4 ref.

Descriptors: Low flow, *Streamflow, *Low-flow frequency, *Streamflow forecasting, *Regression analysis, Evaluation, Equations, Base flow, Flow characteristics, Flow duration, Flow rates, Wisconsin, *Red Cedar River basin(Wis).

Low-flow characteristics in the Red Cedar River basin, Wis., where surplus water may be diverted, and methods to determine low-flow characteristics at additional sites are presented. The low-flow characteristics were determined by various methods at 71 sites. For the three gaging stations in the basin, frequency analysis was used to determine the low-flow characteristics. At 17 partial-record sites correlation analyses were used to estimate the low-flow characteristics. Where only a single base-flow measurement was available (41 sites), equations were developed to estimate low-flow characteristics. The relationships were determined from multiple-regression analyses that related low-flow characteristics at gaging stations, low-flow partial-record stations, and sewage-treatment-plant sites to the drainage area and base-flow index values. The standard errors of estimate were determined to be 25 percent for the Q7,2 equation and 34 percent for the Q7,10 equation. For the main stem of the Red Cedar River where only one discharge measurement was available the low-flow characteristics were determined from a drainage area-discharge relationship. Low-flow characteristics were determined at an additional 30 sites in the Red Cedar River basin by various methods. The method used for these sites depended upon the type and amount of data available at each site. (Woodard-USGS)

LOW-FLOW CHARACTERISTICS OF STREAMS IN THE TREMPEALEAU-BLACK RIVER BASIN, WISCONSIN,

Geological Survey, Madison, WI. Water Resources Div.
B. K. Holmstrom.
Geological Survey Water-Resources Investigations 79-9 (open-file report), February 1979. 79 p, 8 fig, 4 plates, 4 tab, 17 ref.

Descriptors: *Low flow, *Streamflow, *Low-flow frequency, *Streamflow forecasting, *Regression analysis, Equations, Base flow, Evaluation, Flow characteristics, Flow duration, Flow rates, Wisconsin, *Trempealeau-Black River basin(Wis).

Low-flow characteristics of streams in the Trempealeau-Black River basin, Wis., include estimates of low-flow frequency and flow duration at 9 gaging stations; low-flow frequency characteristics at 20 low-flow partial-record stations and 41 miscellaneous sites; and a list of base-flow discharge measurements and low-flow characteristics at 117 miscellaneous sites with one or two discharge measurements. Equations are provided to estimate low-flow characteristics at sites without discharge measurements and at sites where one base-flow discharge measurement is available. The equations were determined from multiple-regression analyses that related low-flow characteristics at gaging stations and low-flow partial-record stations to basin characteristics. The standard error of estimate is provided for each method of estimating the annual minimum 7-day mean flow below which the flow will fall on the average of once in 2 years and once in 10 years. (Woodard-USGS)

FLOOD CHARACTERISTICS OF ALASKAN STREAMS,
Geological Survey, Anchorage, AK. Water Resources Div.
R. D. Lamke.
Geological Survey Water-Resources Investigations 78-129 (open-file report), 1979. 61 p, 21 fig, 6 tab, 5 ref.

Descriptors: *Alaska, *Floods, *Peak discharge, *Flood frequency, *Streamflow forecasting, Regression analysis, Hydrologic data, Climates, Topography, Evaluation.

Peak discharge data for Alaskan streams are summarized and analyzed. Multiple-regression equations relating peak discharge magnitude and frequency to climatic and physical characteristics of 260 gaged basins were determined in order to estimate average recurrence interval of floods at ungaged sites. These equations are for 1.25-, 2-, 5-, 10-, 25-, and 50-year average recurrence intervals. In this report, Alaska was divided into two regions, one having a maritime climate with fall and winter rains and floods, the other having spring and summer floods of a variety or combinations of causes. Average standard errors of the six multiple-regression equations for these two regions were 48 and 74 percent, respectively. Maximum recorded floods at more than 400 sites throughout Alaska are tabulated. Maps showing lines of equal intensity of the principal climatic variables found to be significant (mean annual precipitation and mean minimum January temperature), and location of the 260 sites used in the multiple-regression analyses are included. Little flood data have been collected in western and arctic Alaska, and the predictive equations are therefore less reliable for those areas. (Woodard-USGS)

R. D. Hey.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY4, p 365-379, Proceedings Paper 14500, April 1979. 5 fig, 4 tab, 28 ref, 1 append.

Descriptors: *Gravels, *Flow resistance, *Beds, *Rivers, Open channel flow, Roughness(Hydraulic), Uniform flow, Shape, Darcy-Weisbach equation, Hydraulics, Equations, Mathematical studies, Friction, Darcy-Weisbach friction factor.

The resistance to uniform flow in straight gravel-bed rivers is basically dependent on the flow geometry, the cross-sectional variation in roughness heights, and the roughness height of the graded gravel bed sediment. The effect of these factors on the resistance to flow was evaluated, and a general approach for the estimation of the Darcy-Weisbach friction factor was presented. Independent field data indicated that the method can be successfully applied to predict the resistance to uniform flow in gravel-bed rivers. (Lee-ISWS)

Water Resources Bulletin, Vol. 15, No. 2, p 519-529, April 1979. 5 fig, 1 tab, 8 ref.

Descriptors: *Overland flow, *Storm runoff, *Model studies, Mathematical models, Drainage, Rain, Rainfall, Precipitation(Atmospheric), Storms, Precipitation excess, Runoff, Rainfall-runoff relationships, Peak discharge, Surface drainage, Time of concentration, Flow, Hydrology, Hydraulics, Deterministic-systemic relationships.

An analysis of storm runoff was presented, giving primary attention to deterministic-systemic relationships. So that system aspects can be emphasized, other aspects were kept simple; analysis was made for uniform rainfall on a strip of uniform width, limiting direct applicability to small areas. Two relationships between excess rain and time of concentration, one based on hydraulic parameters, the other on hydrologic characteristics, were combined in a solution for peak discharge. The hydraulic expression gives the interrelationship of time of concentration, excess rain, friction, length, and slope. The hydrologic relationships was achieved by converting ordinary intensity-duration curves to corresponding excess rain intensity-duration curves, thereby interrelating excess rain, time of concentration, and loss characteristics. The resulting solution for peak discharge allowed for systemic feedback among both hydraulic and hydrologic parameters. (Sims-ISWS)

REVIEW OF PROBLEMS WITHIN COMBINED AND PARTLY COMBINED SEWERAGE SYSTEMS IN THE PROVINCE OF ONTARIO.
Gore and Storrie Ltd., Toronto (Ontario).
Canada-Ontario Agreement on Great Lakes Water Quality, Training and Technology Transfer Division (Water), EPS, Environment Canada, Ottawa, Canada; Ontario Ministry of the Environment, Pollution Control Br., Toronto, Ont., 160 p, 6 app, 6 fig, 10 tab, 1979.

Descriptors: *Sewerage, *Sewer systems, *Infiltration, *Inflow, *Floods, *Overflow, *Bypasses, Topography, Soil properties, Water reuse, Water pollution treatment, Drainage water, Human population, Cost trends, *Ontario.

The objective of this project was to identify, assemble, screen and assess background information relating to combined and partly combined sewer systems in Ontario. Case histories of six municipalities were used to emphasize problems and solutions. A questionnaire was sent to 245 municipalities and a 77 percent response was received. In addition, 33 reports were received and analyzed. The replies and reports, analyzed in seven categories, did not indicate significant correlation and trend. The most prevalent problems indicated by the municipalities were of a quantitative nature. They included: infiltration and inflow, basement flooding, overflows, overloading, bypassing, and area flooding. The effect on receiving water quality of combined sewer overflows did not appear to be a municipal concern. The geographical distribution, topography, soil conditions and historical background were found to have practically no correlation with combined or partly combined sewer development and their problems. This was also the case with urban population factors, sewer separation programs, economics and other such factors. (WATDOC)

WATER, WATER EVERYWHERE: POWER FLOWS IN THE LOWER RIO GRANDE VALLEY,
San Francisco Univ., CA.
P. H. Weiner.
Detroit University Journal of Urban Law, Vol. 54, No. 4, p 743-63, Summer, 1977.

Descriptors: *Water control, *Water management, *Rio grande river, *Water rights, Waterquality control, Water supply, Water resources, Water districts, Political aspects, Texas, Irrigation.

The latest episode in the Lower Rio Grande River Valley's century long struggle over scarse water resources is chronicled. Chief among the districts authorized by Texas Statutes are water control and improvement districts (WCID's) now governed by Chapter 51 of the Texas Water Code. Despite the versatility of WCIDs, they have been used in the Lower Valley almost exclusively for irrigation, and chicano colonias have been excluded from their memberships. The solution was rural water supply corporation. Despite its drawbacks, the Military Highway Supply Corporation (MHSC) was created to obtain water rights for colonias that needed them, to contract with existing facilities, and to construct delivery systems for each colonia. There followed a legal battle to gain power in the districts through the election of directors. It was held that: the state had exclusive power to determine the boundaries of its political subdivisions; that the discrimination by the district was between urban and non-urban property owners and not by race; and that notice by publication was acceptable. Power remains concentrated in the hands of Anglo growers, who have both the will and the ability to wield it. (Fortin-Florida)

UNCERTAINTY IN STEP-BACKWATER ANALYSES,
Dames and Moore, Washington, DC.
A. Motayed, and D. R. Dawdy.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Technical Note, p 617-622, May 1979. 1 tab, 4 ref, 1 append.

Descriptors: *Backwater, *Flow profiles, *Computer models, *Risks, *Oregon, Analytical techniques, Analysis, Gradually varied flow, Rivers, River flow, Floods, Water levels, Model studies, *Umpqua River, Step-backwater analyses.

This study examined the uncertainties introduced due to different techniques in the three most commonly used step-backwater computation programs: HEC-2, developed by the Army Corps of Engineers Hydrologic Engineering Center; E-431, developed by the Geological Survey; and WSP-2, developed by the Soil Conservation Service. In order to anaklyze the mathematical uncertainties in the step-backwater computations by the three programs, a reach, about 4 miles long, of the Umpqua River in Douglas County, Oregon, was chosen as a test area. The Umpqua is a large river with a 100-yr discharge of 294,000 cfs and a flat channel (slope being on the order of 0.0008 ft/ft) and a maximum depth of over 50 ft. The major conclusion was that exact data can result in differences of up to 1.9 ft in 100-yr flood elevation, on the average, depending upon the step-backwater program used. The Umpqua is a large river and obviously this difference is not an absolute measure of uncertainty but is expected to indicate a relative measure. This is an uncertainty of about 4% of maximum depth for this study, but it may vary for other stream channels and other floods. However, this uncertainty cannot be eliminated because there is at present no means to judge among various programs. (Humphreys-ISWS)

GRAND COULEE THIRD POWERPLANT, DEGRADATION STUDY,
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
J. O. Blanton, III.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-293 531, Price codes: A08 in paper copy, A01 in microfiche. Report, February 1979. 148 p, 77 fig, 21 tab, 5 ref.

Descriptors: *Channels, *Grand Coulee Dam, *Columbia River(Washington), *Channel morphology, *Channel flow, Riprap, Flow rates, Flow characteristics, Peak discharge, River flow, River beds, Hydraulics, Hydrologic data, Bank stability, Equilibrium.

A study of a six mile reach of the Columbia River downstream of Grand Coulee Dam was undertaken to check channel stability and to recommend remedial measures for protection of unstable areas. Because of fill material placed against the right bank, and the change to high-flow peaking operations, the river will attempt to reach a new equilibrium condition. Some changes have already begun to show on the riverbed and on both banks. Rapidly varying flow will be sustained to a magnitude approaching 400,000 cu ft/second due to peaking operations. Existing and future conditions were used as a basis for the analysis of channel stability, with consideration given to the magnitude of planned peaking flows. Recent channel surveys, bed and bank material size distributions, surface and underwater photographs of the riverbed and banks, measured velocity distributions, and observed water surface profiles were among the basic data. Nine specific recommendations for protective measures in the channel are made. (Davison-IPA)

POTENTIAL FLOOD DAMAGES, WILLAMETTE RIVER SYSTEM, SECTION I,
CH2M/Hill, Portland, OR.
May 1974. 147 p, 53 fig, 24 ref, 3 append. DACW57-73-C-0155.

Descriptors: *Water resources planning, *Flood damage, *Flooding, *Flood data, *Maximum probable flood, *Flood profiles, *Flood damages, *Methodologies, *Willamette River(OR), Flood discharge, River basins, Oregon, Flood stages, Structural damage, Flood plains, Crest stage gages, Flood measurement, Economic impact, Social impact, Electronic data processing.

This study develops a methodology for determining potential flood damages in the northern portion of the Willamette River System of Oregon. The purpose is twofold; to establish the value of all damageable property and estimate the value of potential damages from hypothetical flood stages of the Portland reach of the Willamette River, and to identify more detailed procedures which might be adapted and used for flood damage modeling in other areas. Potential values and damages are estimated for 8 hypothetical floods, from a 40- to a 5,000-year frequency. Detailed methodologies are presented for determining property values and damages in each flood plain. At the Morrison Street Bridge, the water surface level would be 20 feet mean sea level (msl), 35 ft. msl, and 50 ft. msl for the 40-, 500- and 5,000-year frequency floods, respectively. Property damages include residential, and commercial and industrial property as well as bridges, roads, utilities and public and private facilities. Evaluation of potential structural damages from floods ranges from $53,101,000 (40-year flood) to $712,294,000 (5,000-year flood) for the study reach. Nonprimary flood damages could also occur to environmental/aesthetic resources, historical structures, and to the social well being of the society of the river valley. Conclusions are that the methodology can be applied to other areas, but that some of its elements may need to be modified to be compatible. Appendices include a description of the electronic data processing system used, a quantitative summary, and multicolored flood plain maps. (See also W79-07373) (Arnold-NC)
W79-07372

POTENTIAL FLOOD DAMAGES, WILLAMETTE RIVER SYSTEM, SECTION II,
CH2M/Hill, Portland. OR.
May 1974. 424 p, 303 fig, 90 ref, 3 append. DACW 57-73-C-0155.

Descriptors: *Water resources planning, *Flood damage, *Flooding, *Flood data, *Maximum probable flood, *Flood profiles, *Flood damages, *Methodologies, *Willamette River(OR), Flood discharge, River basins, Santiam River(OR), Calapooia River(OR), Flood stages, Structural damages, Flood plains, Crest stage gages, Flood measurement, Economic impact, Social impact, Electronic data processing.

This study develops a methodology for determining potential flood damages in the southern four reaches of the Willamette River System of Oregon: the Willamette River, the Santiam and South Santiam Rivers, and the Calapooia River. The purpose of this project is twofold: to establish the value of all damageable property and estimate the value of potential damages from hypothetical flood stages of these study reaches of the river system, and to identify more detailed procedures which might be adapted and used for flood damage modeling in other areas. Detailed methodologies are presented for determining property values and damages in each of the 4 flood plains. Four hypothetical floods were investigated-100-, 500-, 2,000- and 5,000-year (Maximum Probable Flood-MPF) frequencies. On the Willamette River at the Albany gage the 100-year flood would reach a level of 90.5 ft. mean sea level (msl), while the MPF would crest at 217 ft. msl. The highest stage would be reached on the South Santiam River, with the MPF cresting at 402.4 msl. Property value determinations include residential, commercial and industrial, utilities, moorages and agriculture. Evaluation of total potential flood damage to land, structural improvement, and personal property for the four study ranges from $391,287,000 for the 100-year flood to a high of $1,224,252,000 for the MPF. Nonprimary flood damages could also occur to environmental/aesthetic resources, historical structures, and to the social well being of the society of the river valley system. The report concludes that the methodology can be applied to other areas, but that some of its elements may need to be modified to be compatible. Appendices include a description of the electronic data system used, a quantitative summary, and multicolored flood plain maps. (See also W79-07372) (Arnold-NC)
W79-07373

SPECIAL FLOOD HAZARD INFORMATION REPORT: DEER CREEK, GLENROCK, WYOMING.
Army Engineer District, Omaha, NE.
Prepared for City of Glenrock, Wyoming December 1971. 20 p, 6 plates, 2 tab.

Descriptors: *Wyoming, *Floods, *Regional flood, *Historic floods, *Flood data, *Flood stages, *Peak discharge, *Flood peak, *Deer Creek(WY), Runoff, Flooding, Flood frequency, Flood recurrence interval, Flood damage, Rivers, Floodways, Standard project flood, Flood protection, Flood plain zoning, Glenrock(WY), Little Deer Creek(WY), West Fork Deer Creek(WY), Intermediate regional flood.

The Deer Creek Basin is a 213 square mile area in east central Wyoming. The drainage basin is 30 miles long and up to 7 miles wide. Two major tributaries of Deer Creek are West Fork Deer Creek in the central basin and Little Deer Creek in the lower Basin. About a third of the flood plain in the study area is covered with trees, and its main use is for livestock production. Oil wells are located in the flood plain. Some urban development is located in the flood plain around the city of Glenrock. Flood records were obtained from a gaging station in operation since 1924. Floods are caused by heavy spring and summer rainfall, sometimes augmented by snowmelt. The largest flood occurred in June 1970, discharging 14,200 cubic feet per second (cfs). Damages came close to $1,000,000. Another large flood in May 1965 discharged 12,800 cfs. After an occurrence of the Intermediate Regional Flood (IRF), the Deer Creek surface area would swell to more than eight times its normal width and add up to ten feet to its depth. The Standard Project Flood (SPF) would swell the stream an additional 10-15% in area and in depth. The IRF would have an estimated discharge of 12,700 cfs, while the SPF would have an estimated discharge of 31,500 cfs. The study concludes that future development should not be located in the flood plain. Fast peaking of floods at Glenrock presents a hazard. This study is intended to identify flood hazard areas for the benefit of planning officials. (Arnold-NC)
W79-07374

SPECIAL FLOOD HAZARD INFORMATION, SNAKE RIVER, WILSON, WYOMING AND VICINITY.

Army Engineer District, Walla Walla, WA.
Prepared for Teton County, Wyoming, February 1976. 9 p, 15 plates.

Descriptors: *Wyoming, *Floods, *Flood stages, *Wilson(WY), *Snake River(WY), Runoff, Floodwater, Flooding, Historic floods, Peak discharges, Flood peak, Flow duration, Rivers, River beds, Flood plains, Flood protection, Control structures, Levee, Jackson Hole(WY), Moose(WY), 100-year flood, 500-year flood, Gros Ventre River(WY).

This report presents pertinent flood data for a 28.1 mile stretch of the Snake River in northwestern Wyoming. The reach extends from the U.S. Highway 89 bridge at the downstream end of the Jackson Hole Valley to the town of Moose. The average slope of the stream within the study reach is about 19 feet per mile. The Snake River drains an area of 1,878 square miles above the mouth of the Gros Ventre River, and 2,500 square miles at the Wilson Bridge. Maximum flood peak discharges have occurred seven times between 1894 and 1943, ranging from 22,800 cubic feet per second (cfs) to 41,000 cfs at the Wilson Bridge. Peak discharges for the Snake for the 100-year flood would be 23,300 cfs at the Wilson Bridge. For the 500-year flood, the peak discharge would be 45,000 cfs. Flood profiles indicate that the 100-year flood would inundate approximately 30% additional area above that of normal flow stage. Flood damage reduction measures include Jackson Lake, operated mainly for irrigation but providing regulation for the 100-year flood; and the U.S. Army Corps of Engineers' Jackson Hole Project, a series of levees which contain the Snake River from a point 4.2 miles below the Wilson Bridge to 11.2 miles above the bridge which also provides protection for the 100-year flood. There are no city or county regulatory measures aimed specifically at flood damage reduction. Increasing development is expected in the study area. This report does not provide proposals for solution of flood problems. (Arnold-NC)
W79-07375

SPECIAL FLOOD HAZARD INFORMATION: WALNUT CREEK, SPRINGTOWN, TEXAS.
Army Engineer District, Fort Worth, TX.
Prepared for the City of Springtown, Texas August 1974. 22 p, 3 fig, 4 plates, 2 tab.

Descriptors: *Texas, Standard project flood, *Flood protection, *Browders Creek(TX), *Springtown(TX), *Walnut Creek(TX), Floods, Flooding, Historic floods, Flood frequency, Flood stages, Peak discharge, Rivers, Floodways, Flood plains, Flood plain zoning, Building codes, Land use, Zoning, Control structures, Floodproofing, Unnamed Creek(TX), Intermediate regional flood.

This report details flood information for the Walnut Creek watershed near Springtown, Texas, about 27 miles northwest of Fort Worth. A drainage area of 80.6 square miles, the basin experienced serious flooding in 1951, 1959, 1962, and 1973. Information on flooding was obtained from interviews and newspaper records. The July 1973 flood of the Browders Creek tributary raised water depth more than 10 feet above flood stage and did serious, though isolated, structural damage. The estimated maximum peak flow discharge on Walnut Creek below Browders Creek of the Intermediate Regional Flood (IRF) is 18,800 cubic feet per second (cfs), with a maximum increase in water depth of about 11 feet. Though no flood control structures existed in the basin at the time of this report, the U.S. Soil Conservation Service was considering initiating a flood prevention work plan study which could result in the erection of such a structure. Proposed guidelines for floodplain management are presented, including selective zoning with designation of encroachment lines delineating the floodway zone, narrowing the floodway to accomodate controlled economic development in the adjacent floodplain, institution of new subdivision regulations including building code amendments to require stricter construction requirements for new structures, floodproofing existing structures, health regulations to control sewage disposal in the floodway, developing faster and more accurate flood forecasting, and creating development policies which control extension of public services into the flood hazard area. (Arnold-NC)
W79-07378

FLOOD PLAIN INFORMATION: NATRONA COUNTY, WYOMING, NORTH PLATTE RIVER.
Army Engineer District, Omaha, NE.
Prepared for Natrona County, Wyoming, February 1976, 36 p, 18 fig, 26 plates, 4 tab.

Descriptors: *Wyoming, *Floods, *Historic floods, *Natrona County(WY), *North Platte River(WY), *Flooding, Runoff, Regional flood, Floodwater, Annual flood, Indirect flood measurement, Maximum probable flood, Flood profiles, Flood recurrence interval, Flood stages, Peak discharge, Rivers, Flood plains, Ice jams, Standard Project Flood, Flood protection, Intermediate Regional Flood.

The fourth in a series of reports on watersheds of the North Platte River in Wyoming, this study analyzes the flood hazard to that portion of the river in Natrona County of southeast Wyoming. The flood plain is mostly agricultural, with small ranches in the flood plains. Flood season ranges from May through September. Some flooding is caused by winter ice jams. No flood plain regulatory measures are in force in the study area. Data were obtained from U.S. Geological Survey gages, Bureau of Reclamation records, and newspaper files. Floods in excess of 7,000 cubic feet per second (CFS) have been recorded 15 times since 1904; the largest flood of record occurred in May 1929 at the Casper gage, discharging 13,800 CFS; and an ice jam flow occurred in February 1971. The Intermediate Regional Flood (IRF) would cover an area almost 25% larger than that innundated by normal discharge flow, while the Standard Project Flood (SPF) would innundate an area 40-50% wider than normal river width. At the Natrona-Converse County line, the SPF would discharge 14,400 CFS, and the IRF would discharge 43,000 CFS. The five bridges in the study area are potentially obstructive to flood flow and should be modified. The report was prepared for guidance of local officials in planning the use and regulation of the flood plain. (Arnold-NC)
W79-07379

FLOOD HAZARD ANALYSES: NORTH FORK RUSH CREEK, HENNEPIN COUNTY, MINNESOTA,
Soil Conservation Service, St. Paul, MN.
Minnesota Department of Natural Resources and the Elm Creek Management and Protection Commission, MN December 1977. 24 p, 7 fig, 4 append.

Descriptors: *Minnesota, *Floods, *Regional flood, *Rivers, *Flood plains, *Flood protection, *Flood plain zoning, *Building codes, *Zoning, *Hennepin County(MN), *Rush Creek(MN), *Flood plain management, *North Fork Rush Creek(MN), Flooding, Annual flood, Indirect flood measurement, Flood profiles, Flood frequency, Historic floods, Flood damage, Frail lands, Flood plain insurance, Land use, Planning, Control structures, Floodproofing, Elm Creek, 500-year flood, 100-year flood.

This report describes the flood hazard potential of the North Fork Rush Creek of the Elm Creek Basin of southeastern Minnesota. Located just northwest of the Minneapolis-St. Paul (Twin Cities) metropolitan area, the Elm Creek Basin last experienced flooding in April 1965 from snowmelt coupled with rain. Approximately 25.3 square miles in area, the drainage basin consists mainly of agricultural lands. Due to its proximity to the Twin Cities, the basin is experiencing rapid urbanization. Historical flood data are limited; the 1965 flood appears to have been of slightly less intensity than the 100-year flood. There are no gaging stations in the study area. Eleven of the 19 road crossings over the creek in the study area would be overtopped by the 100-year flood. At the mouth of the creek, the 100-year flood would discharge 610 cubic feet per second (cfs), while the 500-year flood would discharge 745 cfs. The area's flood plain management program contains some zoning ordinances, but the report recommends a more comprehensive program. Flood plain management techniques and tools are presented. The report proposes that the basin be divided into three zones; secondary flood area, where construction of buildings with basements above flood protection elevation is allowed; flood fringe area, where no basements would be constructed; and floodway, where none except possibly recreational uses would be allowed. (Arnold-NC)

CATCH BASIN INTERCEPTOR,
Calspan Corp., Buffalo, NY. (Assignee).
R. J. Pilie, and D. B. Dahm.
U.S. Patent No. 4,136,010, 9 p, 5 fig, 4 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 4, p 1384-1385, January 23, 1979.

Descriptors: *Patents, *Runoff, *Storm runoff, *Pollution abatement, Water storage, Interception, Surface waters, Storm drains, Industrial wastes, Catch basins.

Surface drainage into catch basins frequently contains contaminants which are harmful to the environment and it is desirable that they be intercepted and discharged into holding or treatment facilities. For example, water entering storm drains at major airports may include: spills of oil and fuel; flow of deicing solutions; and the flow of storm runoff which dislodges industrial pollutants from ramp areas and carries them into catch basins. A catch basin may be retrofit for isolating/diverting spills and/or initial storm runoff for the subsequent treatment or recycling of the collected material. A sloping, peripheral trough is provided in the catch basin and is connected to one or more storage or recovery tanks or the like. Several catch basins may be provided with troughs connected to one or more common storage or recovery tanks. (Sinha-OEIS)

In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 93-100, 1977. 9 fig.

Descriptors: *Precipitation, *Flood waves, *Impervious areas, *Nonstationary flows, *St. Venant equations, *Method of characteristics, Networks, Drainage, Discharge(Water), Construction, Open channels, Outfalls, Reach junctions, Cultivation area, Greenhouses, Urban area, Open watercourses, Iteration.

Precipitation falling on an impervious surface generally runs off very rapidly. This results in discharges to the drainage system of considerable intensity and short duration. These essentially nonstationary flows can be described using the St. Venant equations. There are several techniques for solving these equations; used herein is the method of characteristics. Shown is how intricate networks of open watercourses and inherent construction works are calculated by way of iteration. The method, successfully applied to many problems, is described in two of such applications herein. The first relates to a green house cultivation area; the precipitation falling onto the greenhouses is fed into a network of open watercourses as side-flow. The second example deals with the nonstationary discharge through a system of channels in an urban area. The precipitation falling on the urban area is fed into the network through a large number of outfalls as local inflow. (See also W79-07426) (Bell Graf-Cornell)

THE EFFECT OF URBANIZATION ON STORM RUNOFF FROM TWO CATCHMENT AREAS IN NORTH LONDON,
Halcrow (William) and Partners, London (England).
M. J. Hall.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 144-152, 1977. 3 fig, 1 tab, 13 ref.

Descriptors: *Effects, *Urbanization, *Storm runoff, *Hydrologic data, *Catchment areas, *London(Eng), Gaging stations, Rainfall, River flow, Unit hydrographs, Drainage basins, Equations, Baseflow separation, Rainfall loss.

The development of urban areas within a drainage basin may have a marked effect upon its hydrological regime. Owing to the scarcity of hydrometric records from catchments undergoing urban development, the changes in flow regime which occur are often difficult to quantify. One possible approach to overcoming this problem involves: (1) the derivation of unit hydrographs from storms recorded on several catchment areas at different stages of urbanization; and (2) the correlation of variables describing the shape of the unit hydrograph with catchment characteristics, which include descriptions of the urban area and its growth. A study of rainfall and river flow records from two adjacent catchment areas located in the northern suburbs of London has shown that simple measures of urban development, such as the proportion of impervious area, are insufficient to describe the variations in catchment response between ostensibly similar drainage areas. Greater attention should be given to both channel conditions and their modification, and the distribution of urban area within the catchment. (See also W79-07426) (Bell Graf-Cornell)

COMPUTER CONTROLLED MEASUREMENTS OF COMBINED WASTE WATER FLOW AND OVERFLOW,
Technische Univ., Munich (Germany, F.R.). Lehrstuhl fuer Wasserguetewirtschaft und Gesundheitsingesieurwesen.
G. Marr, and L. Pieper.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 277-282, 1977. 3 fig, 1 tab.

Descriptors: *Computers, *Control, *Combined sewers, *Storm water, *Overflow, Urban runoff, Waste water(Pollution), Flow, Rain gages, Hydrologic data, Projects, Water quality, Water quantity, Sampling, Munich(W Germany), Measurement.

Storm water runoff and overflow of combined sewer systems from urban areas cause an increasingly important pollution problem. For more detailed knowledge of the relationship between water quality and quantity three raingages were installed in the study area and measuring and sampling devices were installed in an overflow area. The study area is located in Munich and has a size of 542 ha. Data from eight continually measured parameters and from the analyzed sewer samples have been collected and the system controlled by a mini-computer. A survey is presented of the average and the diurnal variations of the data collected so far. (See also W79-07426) (Bell Graf-Cornell)

HYDROLOGIC DATA FOR WATER-TABLE AQUIFERS IN THE COLORADO SPRINGS--CASTLE ROCK AREA, FRONT RANGE URBAN CORRIDOR, COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
E. C. Hutchinson, and D. E. Hillier.
Available from OFSS, USGS Box 25425, Fed. Ctr. Denver, CO 80225. microfiche $4.00, paper copy $10.00. Geological Survey open-file report 78-948, December 1978. 41 p, 2 fig, 1 plate, 4 tab, 3 ref.

Descriptors: *Water table aquifers, *Well data, *Water levels, *Water quality, *Hydrogeology, Hydrologic data, Springs, Aquifers, Chemical analysis, Colorado, *Douglas County, *El Paso County.

As part of the U.S. Geological Survey's investigations of the hydrology and geology in the Front Range Urban Corridor of Colorado, hydrologic data for water-table aquifers in the Colorado Springs--Castle Rock area were collected and compiled during 1976-77. These data, consisting of records for 157 wells and 47 springs and chemical analyses of water for 135 of the wells and all 47 springs, are presented in tabular form. The tables contain data that were collected during the investigation, data compiled from reports published by the Colorado Water Conservation Board, and unpublished data from the files of the U.S. Geological Survey. State and local officials in the Colorado Springs--Castle Rock area may find these data useful in planning for residential, commercials, and industrial development. (Woodard-USGS)

ALLUVIAL HYDROGEOLOGY OF THE LOWER MISSOURI RIVER VALLEY,
Missouri Univ.-Columbia. Dept. of Geology.
N. G. Grannemann, and J. M. Sharp, Jr.
Journal of Hydrology, Vol. 40, No. 1/2, p 85-99, January 1979. 11 fig, 15 ref. OWRT A-085-MO(4).

Descriptors: *Alluvial aquifers, *Groundwater, Missouri River, *Alluvial channels, Flood plains, Aquifers, Groundwater movement, Water levels, Hydrographs, Model studies, Mathematical models, Clays, Sands, Gravels.

Floodplain deposits in the lower Missouri River valley alluvium can be divided horizontally into a channel belt, meander, belt and flood basin; and vertically, floodplain deposits consist of a top stratum and a substratum. The Missouri, like most major rivers in the midwestern U.S., is an underfit stream which does not fully penetrate its alluvium. Large amounts of groundwater are stored in these alluvial deposits, in which both sediment mean grain size and hydraulic conductivity increase exponentially with depth. Digital computer models indicate, however, that only one flow system exists in the alluvium. Digital simulations and field observations of the floodplain near Glasgow, Missouri, showed 4 types of groundwater response to river stage changes: areas of rapidly fluctuating groundwater levels, areas of slow response, areas of predominantly down-valley flow, and areas of continuing groundwater high. The bank storage-river interaction can be mainly effluent, mainly influent, or a combination of both. The most important factor controlling the floodplain groundwater system is river stage variation. Distance from the river, the time interval since the river has fallen or risen, and the geometry of the river and valley walls all affect the groundwater system. In addition, floodplain inhomogeneities, tributary creeks, and pumping may cause perturbations in groundwater levels. (Sims-ISWS)

VERTICAL AND HORIZONTAL LAND DEFORMATION IN A DESATURATING POROUS MEDIUM,
Princeton Univ., NJ. Dept. of Civil Engineering.
N. M. Safai, and G. F. Pinder.
Advances in Water Resources, Vol. 2, No. 1, p 19-25, March 1979. 12 fig, 2 tab, 9 ref.

Descriptors: *Consolidation, *Soil compaction, *Mathematical models, *Water table aquifers, *Dewatering, Soil water movement, Flow, Equations, Saturated flow, Unsaturated flow, Finite element analysis, Immiscibility, Stress, Pressure head, Model studies, Displacement, Three-dimensional field.

Soil deformation due to the flow of two immiscible fluids can be described by a general three-dimensional deformation field coupled with a three-dimensional hydrologic flow field. The resulting system of equations provides the components of displacement, the pressure, and the fluid satura-

tions. The equations governing saturated-unsaturated soil deformation are obtained as a simplified subset of a more general multiphase formulation. These equations can be solved numerically using an iterative Galerkin finite element technique with a weighted implicit finite difference approximation of the time derivative. A mixed stress-displacement formulation of the governing equations provides the flexibility necessary to consider both stress and displacement boundary conditions. The model predicts the commonly ignored horizontal displacements in a variably saturated system undergoing simultaneous desaturation and deformation. This is accomplished using completely coupled stress and pressure fields. The model provides vertical and horizontal displacement and changes in pressure (head) and saturation as a result of fluid withdrawal in a phreatic aquifer. (Visocky-ISWS)

UNSTEADY-STATE, TWO-DIMENSIONAL RESPONSE OF LEAKY AQUIFERS TO STREAM STAGE FLUCTUATIONS,
Gannett, Fleming, Corddry, and Carpenter, Inc., Harrisburg, PA.
R. J. Dever, Jr., and R. W. Cleary.
Advances in Water Resources, Vol. 2, No. 1, p 13-18, March 1979. 6 fig, 12 ref.

Descriptors: *Surface-groundwater relationships, *Aquifers, *Streamflow, *Leakage, *Mathematical models, Equations, Unsteady flow, Bank storage, Water levels, Hydrographs, Hydraulic conductivity, Aquitards, Stream stage, Leaky artesian aquifers.

The response of stream-leaky aquifer systems with semipermeable stream banks to changes in stream stage was considered. Two-dimensional, unsteady analytical solutions for semi-infinite aquifers were derived by integral transform techniques. Solutions for piezometric head, flow into the aquifer, and bank storage were derived for a step function hydrograph. General solutions for head due to an arbitrary hydrograph also were presented for cases both with and without the semipermeable stream bank. The importance of including the effect of the stream bank was demonstrated. (Visocky-ISWS)

EMERGENCY WATER SUPPLIES FROM GROUND WATER IN HUMID REGIONS,
Harris (Frederic R.), Inc., NY.
S. Bagchi, and A. S. Goodman.
Water Resources Bulletin, Vol. 15, No. 2, p 536-549, April 1979. 6 fig, 8 ref.

Descriptors: *Groundwater, *Streamflow, *Low-flow augmentation, *Model studies, Mathematical models, Water supply, Pumping, Recharge, Natural recharge, Artificial recharge, Streams, Low flow, Water demand, Evapotranspiration, Droughts, Water resources.

This paper focused on the development and testing of a mathematical model of an emergency groundwater supply operated principally during periods of low streamflow. The process of groundwater withdrawal and recharge was simulated taking account of streamflow, water demand, evapotranspiration, natural and artificial recharge, and increased evapotranspiration due to artificial recharge, groundwater pumpage, and streamflow contribution to pumped water. The model determined whether natural recharge is possible in less time than the return period of drought and also whether artificial recharge is needed. By simulating operation over a long period of time, the model can examine different droughts of short and long duration and can test the operating rules for groundwater storage development in an area. Submodels analyze the components of the operating process, including groundwater flow into the stream, seepage losses, stream portion of well discharge due to induced infiltration, and recharge from rainfall or water spreading. The model has been tested for areas in the humid northeastern United States. (Sims-ISWS)

LOCATION OF MUNICIPAL WELL FIELDS IN AN ENVIRONMENTALLY SENSITIVE REGION,
Geraghty and Miller, Inc., Tampa, FL.
F. H. Dove, and P. J. Schreuder.
Water Resources Bulletin, Vol. 15, No. 2, p 326-336, April 1979. 4 fig, 11 ref.

Descriptors: *Hydrology, *Regional analysis, *Water wells, *Municipal water, *Florida, Water levels, Water quality, Groundwater, Wells, Sites, Saline water-freshwater interface, Saline water intrusion, Water resources, Water management(Applied), Aquifers, Water yield, Costs, On-site investigations, Regional economics, Planning, Water resources, Site-selection criteria, Criteria weighting.

A visual selection technique can be utilized to locate potential well field sites prior to on-site testing. The technique is based upon an understanding of the regional hydrology and an appreciation for such development goals as the identification of high-yield and low-impact locations. Although the uniqueness of Pasco, Pinellas, and Hillsborough Counties in Western Florida has been incorporated into the current application, the methodology, with modifications, is transferable to other geographic regions. Overlays of each criterion used in site selection were combined to form a regional composite showing favorable site locations and to serve a useful communications role as visual aids during public presentation. Implications of direct and indirect cost savings to the public are obtained when the methodology is applied to the location of municipal well fields. (Sims-ISWS)

ELECTRIC ANALOG MODEL STUDY OF AQUIFER IN KRISHNI-HINDON INTERSTREAM REGION, U.P., INDIA,
National Geophysical Research Inst., Hyderabad (India).
C. P. Gupta, M. Thangarajan, and V. V. S. Gurunadha Rao.
Ground Water, Vol. 17, No. 3, p 284-290, May-June 1979. 8 fig, 1 tab, 5 ref.

Descriptors: *Groundwater, *Water resources, *Aquifers, *Model studies, Analog models, Pumping, Drawdown, Water levels, Transmissivity, Hydraulic conductivity, Groundwater recharge, Rivers, Rainfall, Irrigation, Evapotranspiration, Hydrology, Hydrogeology, *India, *Uttar Pradesh(India).

Overexploitation of groundwater in Krishni-Hindon interstream region (Lat. 29 deg 05 min N - 29 deg 29 min N and Long. 77 deg 19 min E - 77 deg 32 min E) in Uttar Pradesh, India, prompted us to carry out aquifer modeling studies. The area lies in Gangetic alluvial plain. The interconnection in the phreatic aquifer and the lower semiconfined aquifer led to the assumption of a single-story aquifer for which an R-C analog model was constructed. The input-output quantities in the model were simulated using current/voltage generators and current sinks which were programmed appropriately in time-domain with the help of waveform synthesizers for a realistic representation of the field system. The model study showed that the aquifer can sustain the present output rate of 200 mcm/year without much damage to the groundwater regime. In another scheme, an annual increase of 5% in exploitation rate showed deleterious effects on the aquifer. Decreased rainfall/droughts would worsen the situation. The influence of hydraulic connectivity between the aquifer and the Krishni-Hindon river system is quite significant. If the present exploitation rate were to continue for 20 years, the annual inflow to the aquifer from rivers was estimated to increase by about 36 mcm. More hydrogeological data is required for further validation and refinement of the model. (Sims-ISWS)

REVIEW OF LEAKY ARTESIAN AQUIFER TEST EVALUATION METHODS,
Upper Mississippi River Basin Commission, Twin Cities, MN.
W. C. Walton.
Ground Water, Vol. 17, No. 3, p 270-283, May-June 1979. 11 fig, 11 tab, 15 ref.

Descriptors: *Groundwater, *Artesian aquifers, *Analytical techniques, *Evaluation, Leakage, Groundwater movement, Aquifers, Aquitards, Wells, Water wells, Drawdown, Pumping, Regression analysis, Model studies, Mathematical models, Storage, Hydrology, Hydrogeology, Leaky artesian aquifers.

Flow to wells in leaky artesian aquifers is intimately related to changes in aquitard storage, well storage capacity, and degree of well penetration. The manner and extent to which these and other factors affect water levels may be evaluated with aquifer test data. Families of type curves describe time-drawdown in the aquifer and aquitard under complex aquifer and well-penetration conditions. Analysis of leaky artesian aquifer test data is possible with the array of equations derived largely in the 1950's through 1970's. Erroneous data analysis will result unless complicating factors are fully recognized and taken into account. A review of leaky artesian aquifer test evaluation methods was presented in this paper together with the field application of selected methods to foster greater use of current theories. (Sims-ISWS)

LOCATING GROUND WATER IN THE SANTA CATHERINA AREA USING GEOPHYSICAL METHODS,
Geological Survey of Israel, Jerusalem. Hydrogeology Div.
D. Wachs, A. Arad, and A. Olshina.
Ground Water, Vol. 17, No. 3, p 258-263, May-June 1979. 7 fig, 3 ref.

Descriptors: *Groundwater, *Water resources, *Surveys, Geology, Geomorphology, Aquifers, Locating, Water supply, Rocks, Alluvium, Wells, Water wells, Hydrogeology, *Israel, *Sinai(Israel), *Santa Catherina(Israel), Geophysical techniques.

An attempt was made to locate groundwater in an arid, mountainous area in the Santa Catherina region of southern Sinai. A combination of classical geological methods, together with geophysical techniques, was found to be particularly useful for the locality studied. It was found that water flow was mainly through the joints of the crystalline basement and that under favorable circumstances, fair groundwater supplies can be found in alluvial valley fill. It was concluded that recharge of valley fill is derived mainly from the joint system of the bedrock and only partially from flooding. (Sims-ISWS)

MAINE'S GROUND-WATER SITUATION,
Maine Geological Survey, Augusta.
W. B. Caswell.
Ground Water, Vol. 17, No. 3, p 235-243, May-June 1979. 17 fig.

Descriptors: *Groundwater, *Aquifers, *Geology, *Maine, Alluvial aquifers, Artesian aquifers, Sand aquifers, Water levels, Bedrock, Water wells, Water resources, Water quality, Faults(Geologic), Fractures(Geologic), Coasts, Saline water intrusion, Groundwater movement, Recharge, Natural recharge, Groundwater recharge, Hydrogeology.

Maine's population is highly dependent upon groundwater supplies that are obtained from low-yield, fractured, crystalline bedrock aquifers. Although most domestic bedrock wells yield less than 10 gallons per minute (gpm), there are a number of bedrock wells that yield 10 to 300 gpm. Many of these wells are drilled in the vicinity of major faults. Some bedrock wells intersect fractures that open directly to the land surface, which causes them to be particularly susceptible to contamination. The glacial cover is generally less than 20 feet thick and is not considered a significant aquifer in most places. Sand and gravel aquifers are scattered across the state, but in total cover only about 15% of the surface. Coastal residents commonly obtain water from the fractured rock aquifer. Saltwater intrusion occurs, but in most places appears to be caused by the geometry of the rock fractures rather than by excessive pumping. Groundwater quality is generally good because of low solubility of the crystalline rocks and because of dilution by plentiful rainfall. (Sims-ISWS)

GROUNDWATER RECHARGE IN THE DOLOMITE OF THE GHAAP PLATEAU NEAR KURUMAN IN THE NORTHERN CAPE, REPUBLIC OF SOUTH AFRICA,
Geological Survey of South Africa, Pretoria. Dept. of Mines.
P. J. Smit.
Water S. A., Vol. 4, No. 2, p 81-92, April 1978. 13 fig, 3 ref.

Descriptors: *Groundwater recharge, *Natural recharge, *Springs, *Subsurface waters, *Hydrology, Geologic units, Geohydrologic units, Flow measurement, Evapotranspiration, Rainfall, Ghaap Plateau(South Africa), Water levels, Leakage, Surface runoff, Boreholes, Evaporation.

The flows of several natural springs on the dolomite of the Ghaap Plateau Formation were measured between 1959 and 1970 to determine natural groundwater recharge. The underground catchment, or groundwater compartment, delineated from a survey of the water levels, has a surface area of about 1,140 sq km; groundwater from this area is drained by four springs. In some of the 50 smaller subcompartments springs drain the underground water into the adjoining compartment. A groundwater balance sheet was drawn up with all possible groundwater losses taken into account prior to measuring the flow at the point of discharge at the springs. Although the general groundwater in the area is rarely less than 20 m below the surface, it ranged between ground level and 200m below the surface. The average annual recharge during the study period was calculated to be 2.5% of the 346 mm annual rainfall. Groundwater recharge, based on the potential evapotranspiration rate and calculated according to the Thornthwaite Method, was 2.94% for the 1940 to 1970 period with an average rainfall of 445 mm. (Davison-IPA)

ENVIRONMENTAL BASELINE DESCRIPTIONS FOR USE IN THE MANAGEMENT OF FORT CARSON NATURAL RESOURCES. REPORT 5. GENERAL GEOLOGY AND SEISMICITY,
Army Engineer Waterways Experiment Station, Vicksburg, MI. Mobility and Environmental Systems Lab.
E. A. Dardeau, Jr., and M. A. Zappi.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A046 828, Price codes: A04 in paper copy, A01 in microfiche. Technical Report M-77-4. September 1977, 62 p, 2 tab, 12 fig, 29 ref. 4A162121A8696.

Descriptors: *Geology, *Natural resources, *Geologic investigations, *Geologic time, *Hydrology, *Geologic units, *Groundwater resources, *Fort Carson(CO), *Military installations, Aquifers, Water supply, Seismology, Hydrography, Surface hydrology, Holocene, Environmental data, Environmental management, Stratigraphy.

This report is the fifth in a series of six reports describing methodologies and procedures to collect environmental baseline data that are pertinent to the Fort Carson Long-Range Environmental Program. This report covers the general geology and seismicity of Fort Carson and shows how geologic and seismic parameters relate to engineering and resort management practices of this military installation. The project accomplishes four main tasks: (1) outlines the effect of physiography on climate, surface hydrology, and sedimentation; (2) describes geologic structure and stratigraphic units and discusses the engineering importance of these units; (3) locates water wells and discusses water-bearing strata (aquifers) in the Fort Carson area; (4) correlates seismicity with engineering and resource management problems. Fort Carson lies in both the Great Plains and Southern Rocky Mountain physiographic provinces. Geologic structural features on Fort Carson can be a source of potential seismic activity, can present problems in construction, and can cause difficulties in locating groundwater. The supplies of groundwater at Fort Carson are inadequate both in terms of quality and quantity. The area has been free of serious earthquakes, but hazards to construction exist even from minor quakes. The report recommends the establishment of several permanent meteorologic stations and a stream gaging and sediment sample collection program at Fort Carson. (Coan-NC)

EFFECTS OF URBANIZATION ON GROUNDWATER, (EFFETS DE L'URBANISATION SUR LES EAUX SOUTERRAINES),
Bureau de Recherches Geologiques et Minieres, Orleans, (France). Dept. Carte Geologique et Geologie Generale.
L. Monition.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 162-166, 1977. 9 ref.

Descriptors: *Urbanization, *Groundwater, *Effects, *Simulation analysis, Evaluation, Hydrologic cycle, Water resources, Mathematical models, Systems analysis.

In France, the new law promulated in June 1976 concerning the protection of the natural environment states that the groundwater and the subsoil are resources that must be protected from all forms of degradation. The effects of urbanization on groundwater are characterized by changes in recharge, runoff, piezometric level, flow and physical and chemical properties. The quantitative evaluation of these impacts is now possible by means of simulation techniques which allow one to analyze and predict the detrimental changes. Some examples of the effects of urbanization on groundwater (aquifers) are mentioned: galleries, tunnels, metros, underground parking, canalization of water courses, water supply, and gravel pits. THE LYON-SATOLAS AIRPORT. A HYDRODYNAMIC STUDY OF THE MEYZIEUX GLACIER STREAM VALLEY WITH A VIEW TO PROTECTING THE QUALITY OF THE WATER RESOURCES. SIMULATION OF THE TRANSPORT OF POLLUTANTS, (IN FRENCH),
Buereau de Recherches Geologiques et Minieres, Orleans (France). Dept. Carte Geologique et Geologie Generale.
D. Rousselot.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 389-407, 1977. 16 fig, 11 ref.

Descriptors: *Groundwater development, *Water quality control, *Hydrodynamics, *Simulation analysis, *Water supply, Drainage, Mathematical models, Systems analysis, Airports, Measurement, Basins, Structures.

The creation of the Lyon-Satolas airport has raised a number of hydrodynamic problems, reflecting all those which can arise from the siting of any new substructure. The particular problem posed by the airport site is the absence of a nearby river system, purifying system, or water distribution networks onto which it is economically possible to be connected. The solutions to these problems must be sought locally by turning to the groundwater resources, with the view to safeguarding them as far as possible with respect to quality and quantity. Among the problems raised is the water supply of the airport which requires 600 m3/h of water for drinking water and air conditioning, the infiltration of rainwater collected in the airport's wells, the construction of an infiltration of rainwater collected in the airport's wells, the construction of an infiltration basin, the testing and protection of the quality of the aquifer linked to effluents even in this basin, and to the testing and protection of the airport with the risks of accidental discharge of soluble pollutants which can run into it, and the outflow of air conditioning water. A deep hydrodynamic study, with numerous measurements of the transfer characteristics and the positioning of a dispersive model to simulate drainage, has given us the ability to answer to the questions formulated. 2G. Water In Soils

MONITORING WATER MOVEMENT THROUGH STRIP MINE SPOIL PROFILES,
Science and Education Administration, University Park, PA. Northeast Watershed Research Center.
A. S. Rogowski, and E. L. Jacoby, Jr.
Transactions of the American Society of Agricultural Engineers, Vol. 22, No. 1, p 104-109, 114, January-February 1979. 4 fig, 5 tab, 14 ref.

Descriptors: *Soil water movement, *Spoil banks, *Strip mine wastes, Mine wastes, Infiltration, Erosion, Sediments, Moisture content, Soil water, Lysimeters, Soils, Density, Hydraulic conductivity, Topsoil, Instrumentation, Tensiometers, Soil science.

Two, 3.6-m deep, 2.4-m diameter caissons were used to measure movement in reconstructed spoil profiles. Details were presented of instrumentation and methods were proposed for determining spoil-water-retentivity curves and hydraulic conductivity as a function of water content and/or tensiometer pressure, including a correction for the coarse fragment content. This correction may be significant when modeling flows in the coarse fragment content. This correction may be significant when modeling flows in spoil materials. During water application, it was found that on spoil alone, water infiltrated faster, and less of it was retained in the profile after drainage than on top-soiled spoil. More sediment moved with infiltrating water in the topsoiled profile, and oxygen concentrations after application of water were lower than on spoil alone. Similar situations may prevail in the field. During the initial wetting, settlement was considerable and changes in temperature and bulk density were good indicators of water movement within the spoil and topsoiled spoil profiles. However, flow through larger channels did contribute significant amounts of water to the water table in the spoil without being detected by radioactive probes, temperature probes, or tensiometers. (Sims-ISWS)

STEADY STATE MOISTURE FLOWS IN UNSATURATED SOIL CONTAINING A PLANE, ISOLATED, IMPERMEABLE BARRIER,
Princeton Univ., NJ. Dept. Civil Engineering.
D. K. Babu.
Advances in Water Resources, Vol. 2, No. 1, p 35-45, March 1979. 5 fig, 12 ref, 3 append. NSF ENG77-24979.

Descriptors: *Soil water movement, *Soil water, *Unsaturated flow, *Model studies, Mathematical models, Steady flow, Hydraulic conductivity, Impervious soils, Barriers, Soils, Soil moisture, Equations, Analytical techniques, Hydrology, *Impermeable barriers.

A three-dimensional, axially symmetrical, steady-state flow of moisture in an unsaturated soil was analyzed. The steady-state infiltration was maintained by a constant flux across a circular disc on the horizontal soil surface. The flow encountered an obstacle in the form of a plane circular impermeable barrier of arbitrary radius. Except for this isolated barrier, at a given arbitrary depth, the rest of the soil was homogeneous and isotropic. The governing differential equation was linearized by assuming the hydraulic conductivity to be an exponential function of the pressure head. Techniques associated with dual integral equations constitute the basic tools that were employed in solving this problem. Explicit formulas and expressions were obtained for computing the solution for arbitrary values of the radius of the source, of the radius of the obstacle, and of the distance between them. Keeping the radius of the source as unity, the barrier radius and depth were varied in illustrative examples. Results were plotted in a series of figures. The concluding section briefly mentioned relevance of such analysis to interpretation of field data on moisture contents or calculations of hydraulic conductivity. The problem of flow around an isolated disc in infinite space, with a uniform gravitational flow at large distances from this disc, can also be solved by the methods developed here. This was done, and the results were plotted in a figure. (Sims-ISWS)

PREDICTION OF FIELD SOIL WATER CONTENT,
Department of Agriculture, Swift Current (Saskatchewan). Research Station.
D. R. Cameron.
Soil Science Society of America Journal, Vol. 43, No. 2, p 390-394, March-April 1979. 4 fig, 3 tab, 20 ref.

Descriptors: *Soil water, *Soil water movement, *Soil moisture, *Model studies, Mathematical models, Simulation analysis, Hydraulic conductivity, Soils, Precipitation(Atmospheric), Rainfall, Percolation, Percolating water, Air temperature, Evaporation, Soil science.

A 3-year experiment was conducted to monitor and subsequently to predict field water contents using the water transport model. Saturated hydraulic conductivities and soil water characteristic curve results were measured and averaged for each soil layer. The Millington-Quirk (MQ) method was used to calculate average model parameters. Direct use of the MQ-derived conductivity and diffusivity functions did not give an exact fit to the observed field results. However, when reasonable adjustments were made to the K(theta) and D(theta) functions, the prediction was improved considerably. The methodology for 'averaging' and utilizing field data to derive model parameters and subsequent adjustment or optimization of the model parameters all require more research in order to use the unsaturated flow equation for field water content prediction. (Sims-ISWS)

NITRATE LEACHING IN A SLUDGE-TREATED FOREST SOIL,
Science and Education Administration, Morgantown, WV.
R. C. Sidle, and L. T. Kardos.
Soil Science Society of America Journal, Vol. 43, No. 2, p 278-282, March-April 1979. 2 fig, 3 tab, 16 ref.

Descriptors: *Nitrates, *Leaching, *Sludge treatment, *Forest soils, *Model studies, Mathematical models, Solutes, Hardwood, Sludge, Pores, Porosity, Nitrogen, Nitrogen compounds, Nutrients, Forests, On-site investigations, Soil water movement, Soil science.

Anaerobically digested liquid sludge was applied during 2 separate periods to plots in a mixed hardwood forest. High treatment plots received 26.96 metric tons/ha total solids and 3,034 kg/ha N loadings during the two applications, and low treatment plots received approximately half these loadings. Percolate samples collected at the 15-cm depth contained a maximum of 290 mg/liter NO3(-)-N in the high treatment and 194 mg/liter NO3(-)-N in the low treatment. Maximum monthly levels of NO3(-)-N in percolate sampled at the 120-cm depth lagged 6 months behind peak levels at the 15-cm depth. Calculated average active transmitting soil porosity (P sub act), based on field water budget data over this 6-month period, ranged from 15 to 22%. A CSMP computer simulation model based on a solution to the convection diffusion equation estimated the average P sub act to be 15%. Since these data indicate that 27 to 50% of the pores may be stagnant, this suggests that soluble NO3(-)-N was being channeled through interconnected macropores in the soil profile. (Sims-ISWS)
W79-07142

USE OF GOODNESS-OF-FIT TESTS FOR CHARACTERIZING THE SPATIAL VARIABILITY OF SOIL PROPERTIES,
Florida Univ., Gainesville. Dept. of Statistics.
P. V. Rao, P. S. C. Rao, J. M. Davidson, and L. C. Hammond.
Soil Science Society of America Journal, Vol. 43, No. 2, p 274-278, March-April 1979. 3 fig, 2 tab, 17 ref.

Descriptors: *Soil properties, *Variability, *Statistical methods, *Estimating, Analytical techniques, Spatial distribution, Sampling, Soil density, Soil water, Correlation analysis, Statistical models, Monte Carlo method, Hydraulic conductivity, Equations, Dispersion, Log normal distribution.

Application of the empirical distribution function statistics to describe the spatial variability of soil properties was discussed. The Kolmogorov statistic and the Cramer-von Mises statistics were utilized to evaluate the goodness-of-fit of a hypothesized theoretical distribution function to a sample of measurements of spatially-varying soil properties. Because normal and log-normal distributions have been commonly used to describe the variability of several soil properties, a Monte Carlo study was performed to determine the sample size required for selecting, with a prescribed level of confidence, between these 2 distributions. It was found that the required sample size increased with decreasing coefficient of variation (CV = standard deviation/mean). However, both normal and log-normal distributions may adequately describe a set of measurements with CV equal to or less than 0.4. In such cases, it was shown that accepting normal distribution as the appropriate distribution when the true distribution is, in fact, log-normal would involve a maximum error of about 20% when the mean is used instead of the mode. DRAINAGE WATER SAMPLING IN A WET, DUAL-PORE SOIL SYSTEM,
Centre County Planning Commission, Bellefonte, PA.
K. A. Shaffer, D. D. Fritton, and D. E. Baker.
Journal of Environmental Quality, Vol. 8, No. 2, p 241-246, April-June 1979. 2 fig, 5 tab, 12 ref.

Descriptors: *Water sampling, *On-site tests, *Leachate, *Pennsylvania, Testing procedures, Nitrates, Cadmium, Soil water, Loam, Silts, Methodology, Water analysis, Instrumentation, Hublersburg silt loam.

Two experiments were conducted on an undisturbed Hublersburg silt loam (Typic Hapludult) soil to evaluate 2 different soil solution sampling techniques. The 2 techniques were employed simultaneously to sample the leachate at depths of 38 to 120 cm when water was added at the soil surface with known concentrations of NO3-N (0-579 ppm) and Cd(2+) (0.0001-5.45 ppm). After each controlled water addition to the surface, soil water samples were taken for analysis with porous cup soil water samplers and with devices located in a subsurface horizontal tunnel. Large differences in ion concentration occurred between data obtained from the soil water samplers and from the horizontal tunnel. Calculations based on water retention data indicated that in excess of 90% of the total flow occurred in pores drained by water potentials of 0 to -20 cm of water. This pore class is considered to be dominated by interped cracks and to cause a channeling of solution past the porous cup samplers. It was concluded that under wet soil conditions, soil water samplers are not suitable for monitoring the chemical quality of the water percolating through the soil profile. (Humphreys-ISWS)

CONSEQUENCES OF WATER MOVEMENT IN MACROPORES,
Kentucky Univ., Lexington. Dept. of Agronomy.
G. W. Thomas, and R. E. Phillips.
Journal of Environmental Quality, Vol. 8, No. 2, p 149-152, April-June 1979. 6 fig, 22 ref.

Descriptors: *Soil water movement, *Solutes, *Soil water, *Infiltration, Percolation, Recharge, Natural recharge, Drainage, Rainfall, Soils, Porosity, Pores, Leaching, Irrigation, Soil science, Macropores.

Current views of infiltration of water into soils are based on nearly complete displacement of soil water by incoming water. In general, rapid flow down macropores and its effect on water and solute distribution have not been considered very important by the majority of researchers. Evidence was presented to show that flow of water through macropores is important in soil and groundwater recharge and in salt movement through soils. (Sims-ISWS)

EVIDENCE OF FISH SURVIVAL DURING HABITAT DESSICATION IN RHODESIA,
Department of National Parks and Wildlife Management, Causeway (Rhodesia). Rhodes Matopos National Park.
B. G. Donnelly.
Journal of the Limnological Society of Southern Africa, Vol. 4, No. 1, p 75-76, July 1978. 1 ref.

Descriptors: *Fish behavior, *Aquatic environment, *River beds, *Dry beds, *Dry seasons, *Vertical migration, Wildlife, Wildlife habitats, Rhodesia.

From March onward many Rhodesian rivers being to dry out, leaving a dry sandy river bed apparently devoid of fish. Data are reported from 14 observations which suggest a behavioral adaptation by S. mossambicus, Clarias gariepinus, Engraulicypris brevianalis which allows them to survive when the rivers dry out. The fish may be able to burrow into wet sand and stay alive for several months by maintaining contact with the subsurface water table. During excavations of the dry sandy river beds fish have been found in the sand up to a depth of 6 m. Future research investigations are recommended concerning the oxygen values at the depth

where fish are found, and the acclimation by these fish to long periods of complete darkness, little movement, and no food. (Davison-IPA)

CALCULATION OF SATURATED HYDRAULIC CONDUCTIVITY OF SOME PEDAL CLAY SOILS USING MICROMORPHOMETRIC DATA,
Soil Survey Inst., Wageningen (Netherlands). Dept. of Micropedology.
J. Bouma, A. Jongerius, and D. Schoonderbeek.
Soil Science Society of America Journal, Vol. 43, No. 2, p 261-264, March-April 1979. 2 fig, 3 tab, 10 ref.

Descriptors: *Hydraulic conductivity, *Saturated flow, *Soil properties, Laboratory tests, Analytical techniques, Microscopy, Soils, Clays, Soil water, Soil water movement, Mathematical models, Data processing, Soil science, Soil swelling.

The saturated hydraulic conductivity (K sub sat) was calculated for undisturbed freeze-dried samples of 7 clay soils by using micromorphometric Quantimet data. Voids were characterized in terms of quantity (number and length), type, and directly measured size. Methylene blue was used to indicate flow patterns. A statistical planar and tubular void-interaction model was used to estimate sizes of 'necks' in the flow system, which were assumed to determine K sub sat. Measured K sub sat values were within the calculated K sub sat range, when relatively large, vertically continuous tubular voids were not present. Very small variations of the width of planar 'necks' had a strong effect on the magnitude of K sub sat. Soil which was moist when sampled had larger planar 'necks' and higher K sub sat values than soil which had been in wet condition for several months. This difference was attributed to the effects of soil swelling. In general, volumetric percentages of active (stained) voids (estimated by % surface area) were less than 1. This illustrates the basic difficulty of estimating K sub sat in clay soils by methods which use relative volumes of voids. (Sims-ISWS)

Soil Science Society of America Journal, Vol. 43, No. 2, p 333-338, March-April 1979. 5 fig, 7 tab, 17 ref.

Descriptors: *Hydraulic conductivity, *Soils, *Soil water movement, *Bacteria, Laboratory tests, Soil water, Microorganisms, Pores, Metabolism, Soil bacteria, Aerobic bacteria, Anaerobic bacteria, Nutrients, Leaching, Phosphorus compounds, Biological communities, Biological properties, Soil science.

Laboratory experiments were performed to determine the relationship between bacterial pore clogging and soil hydraulic conductivity. When soils were submerged and hydraulic conductivity was plotted against time, the conductivity decreased and eventually stabilized at a constant value. The time required, the stable value, and the coefficient of variability (CV) were all influenced by the treatment applied to the soil. Sterile soils had the highest hydraulic conductivity and lowest CV of all treatments. Continuous submergence and wetting and drying cycles were compared in their effects on hydraulic conductivity. A specific portion of the total biological activity (as determined by the acid phosphatase assay) and a selective bacterial population (accounted for by the medium used) were significantly and negatively correlated with hydraulic conductivity. As the bacterial population and phosphatase activity increased, the hydraulic conductivity decreased. The decrease in hydraulic conductivity under prolonged periods was due primarily to the excretion of metabolic products produced by bacteria within the soil pores. (Sims-ISWS)

DISSOLUTION AND TRANSPORT OF GYPSUM IN SOILS: II. EXPERIMENTAL,
Colorado State Univ., Fort Collins; and Science and Education Administration, Fort Collins, CO.
T. K. Glas, A. Klute, and D. B. McWhorter.
Soil Science Society of America Journal, Vol. 43, No. 2, p 268-273, March-April 1979. 5 fig, 2 tab, 18 ref. OWRT A-017-COLO(3).

Descriptors: *Leaching, *Laboratory tests, *Model studies, *Kinetics, Porous media, Gypsum, Soils, Methodology, Movement, Dispersion, Solutes, Analysis, Chemical reactions.

Experimental information on the dissolution of gypsum and the subsequent transport of the dissolved species in a soil-water system was obtained by adding distilled water to the top of 30-cm long columns containing a soil-gypsum mixture and by measuring the calcium concentration in the solution phase as a function of time at different positions in the columns. The measured concentration-time curves were compared with results from 2 models--the first based on equilibrium chemical principles and the mixing-cell concept, and the second model based on a combination of the one-dimensional convection-dispersion equation and a first-order kinetic expression describing the dissolution process. Under the specific experimental conditions studied, the dissolution process appeared to be kinetically controlled and could not be described by the solubility-product relationship. (Humphreys-ISWS)

DISSOLUTION AND TRANSPORT OF GYPSUM IN SOILS: I. THEORY,
Colorado State Univ., Fort Collins; and Science and Education Administration, Fort Collins, CO.
T. K. Glas, A. Klute, and D. B. McWhorter.
Soil Science Society of America Journal, Vol. 43, No. 2, p 265-268, March-April 1979. 4 fig, 14 ref.

Descriptors: *Leaching, *Model studies, *Porous media, *Kinetics, Mathematical models, Theoretical analysis, Analytical techniques, Mathematics, Gypsum, Chemical reactions, Equations, Soils, Movement, Dispersion, Infiltration, Solutes.

A model was developed describing the dissolution and subsequent transport of gypsum from a soil column by combining the one-dimensional convection-dispersion equation with a kinetic expression for the dissolution process. The resulting partial differential equations were solved numerically by the method of lines. Results were presented showing the effect of the various parameters in the model on calculated concentration-time curves. (Humphreys-ISWS)

EXPERIMENTAL INVESTIGATION OF THE PENETRATION COEFFICIENT IN CAPILLARY TUBES,
Louvain Univ. (Belgium). Dept. de Genie Rural.
R. S. Malik, Ch. Laroussi, and L. W. De Backer.
Soil Science, Vol. 127, No. 4, p 211-218, April 1979. 7 fig, 3 tab, 8 ref.

Descriptors: *Penetration, *Capillary conductivity, *Capillary action, *Model studies, Laboratory tests, Flow, Theoretical analysis, Tubes, Density, Gravity, Surface tension, Velocity, Time, Darcys law, Graphical analysis, Evaporation, Condensation, Penetration coefficient, Capillary tubes, Poiseuilles law.

Parameters influencing the penetration coefficient lambda were experimentally investigated by causing various liquids to flow in horizontal, straight glass capillaries of different radii. The conductivity of the capillary tube remains constant during the flow and is defined in terms of penetration coefficient, density, gravity, capillary radius, surface tension, and contact angle. The relationship between the square root of time and the penetration distance was found to hold true for the whole period studied. The experimental and theoretical values of both penetration coefficient and conductivity compared favorably and verified the validity of Poiseuille's law in unfilled capillaries. Theoretical proportionality between the square of the penetration coefficient and the capillary radius, on the one hand, and liquid properties in terms of sigma cos alpha sub a/micron, on the other, was found to be experimentally true. Experimental values of the penetration coefficient matched those calculated theoretically from handbook data when using the contact angle calculated from the capillary height reached by the advancing meniscus. A SIMPLE SOIL HEAT FLUX CALCULATION FOR NUMERICAL MODELS,
National Weather Service, Silver Spring, MD. Techniques Development Lab.
W. A. Shaffer.
NOAA Technical Memorandum NWS TDL 68, May 1979. 14 p, 6 fig, 8 ref.

Descriptors: *Soil temperature, *Energy equation, *Mathematical models, Heat flow, Energy balance.

An analytic solution of the heat equation is the basis for a scheme to compute the soil heat flux needed for a surface energy balance calculation. An initial soil temperature profile and constant thermal properties are assumed. No vertical computational levels within the soil are used or needed. The scheme is inherently accurate, since it is derived from an analytic solution and is immune from the problems of spatial truncation error and numerical instability associated with finite-difference techniques. Two simplifications of the scheme are presented that reduce computer storage requirements and the number of computations, allowing the scheme to be applied to models with a wide range of time steps. IMPACT OF GREAT LAKES WATER LEVEL FLUCTUATIONS ON COASTAL WETLANDS,
Eastern Michigan Univ., Ypsilanti. Dept. of Geography and Geology.
E. Jaworski, C. N. Raphael, P. J. Mansfield, and B. B. Williamson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 403, Price codes: A16 in paper copy, A01 in microfiche. Project Completion Report Institute of Water Research, Michigan State University April, 1979. 363 p. OWRT B-045-MICH(1), 14-0001-7163.

Descriptors: *Wetlands, *Water level fluctuations, Succession, Plant communities, Models, Diking, Coastal management, Aerial photography, *Great Lakes, Oconto River(WI), Betsie River(MI), Tobico Marsh(MI), Tuscola Wetlands(MI), Dickinson Island(MI), Woodtick Peninsula(MI), Toussaint Marsh(OH).

Field measurements were collected over a two-year period at seven study areas along Lakes Michigan, Huron, St. Clair, and Erie. Surface landforms were mapped, and models of the four coastal wetland types were developed. With the aid of aerial photography and field bisects, the zonal plant communities were identified and three historical distribution maps were constructed which represented various lake level conditions. Field data indicate that water level, wave energy, and substrate type are important factors in determining the shifting of plant communities in response to lake level fluctuations. A plant community displacement model reveals that most of the shrub and some of the meadow communities tend to persist at any lake level, but that emergent, floating-leaved, and submersed aquatics are displaced by other communities or by open water. As the plant communities shift in response to water level changes, the value and function of the wetland system changes. Although diking may protect coastal wetlands from wave erosion and inundation during high water, as well as provide protection from polluted land drainage, structural management reduces the multiplicity of wetland uses and functions, particularly with regard to fish habitat values and hydrological functions.

A FILLING-BOX MODEL OF RIVER-DOMINATED LAKES,
Cambridge Univ. (England). Dept. of Applied Mathematics and Theoretical Physics.
P. D. Killworth, and E. C. Carmack.
Limnology and Oceanography, Vol. 24, No. 2, p 201-217, March 1979. 12 fig, 24 ref.

Descriptors: *Lakes, *Rivers, *Model studies, Mathematical models, Inflow, Discharge(Water), Temperature, Water temperature, Stratification, Density, Pollutants, Path of pollutants, Dynamics, Mixing, Heat transfer, Hydrology.

A dynamical model of river-lake interaction was used to quantitatively examine the physical behavior of the Kamloops Lake-Thompson River system in British Columbia. The analysis was based on the so-called filling-box method which predicts the thermal stratification of the lake relative to hydrological conditions; specifically the river's effect on thermocline formation and decay, convective overturn, heat exchange, and particle residence time were examined. The model can be used to simulate the effects of hypothetical developments in the watershed and to examine physical processes relevant to the release of pollutants upstream. (Sims-ISWS)

ACOUSTICAL ESTIMATION OF ZOOPLANKTON POPULATIONS,
Oregon State Univ., Corvallis. School of Oceanography.
C. F. Greenlaw.
Limnology and Oceanography, Vol. 24, No. 2, p 226-242, March 1979. 12 fig, 19 ref.

Descriptors: *Remote sensing, *Zooplankton, *Acoustics, Plankton, Aquatic microorganisms, Aquatic life, Particle size, Equipment, Surveys, On-site investigations, Biomass, Biology, Limnology, Euphausiids, Backscattering, Backscattering cross-sections.

Acoustical estimates of zooplankton abundance can be made rigorously if the scattering behavior as a function of size and frequency for the zooplankters is known. Measurements of scattering at a single frequency can be used to estimate abundance if the mean zooplankter size is known. Measurements at two frequencies can be used to estimate the dominant size as well as abundance if a single size zooplankter dominates the acoustical scattering. Measurements at several frequencies can be used to estimate size distributions and abundances. In a field experiment, acoustical scattering was measured at three frequencies for zooplankton layers composed largely of euphausiids (for which an approximate scattering model is known). These data were analyzed by each method and estimates of numerical abundance given. (Sims-ISWS)

DISSOLVED OXYGEN MODEL OF A SHORT DETENTION TIME RESERVOIR WITH ANAEROBIC HYPOLIMNION,
Iowa Univ., Iowa City. Dept. of Environmental Engineering.
J. L. Schnoor, and E. G. Fruh.
Water Resources Bulletin, Vol. 15, No. 2, p 506-518, April 1979. 7 fig, 14 ref.

Descriptors: *Dissolved oxygen, *Texas, *Reservoirs, *Hypolimnion, *Model studies, Mathematical models, Water quality, Ammonia, Biochemical oxygen demand, Conductivity, Temperature, Water temperature, Sediments, Lakes, Inflow, Discharge(Water), Evaporation, Rain, Diffusion, Phytoplankton, Limnology, *Lake Lyndon B Johnson(TX).

A vertical dissolved oxygen model was calibrated and verified using independent field data sets from 1972 and 1973 in Lake Lyndon B. Johnson, a short detention time reservoir with anaerobic hypolimnion. Ammonia, Carbonaceous BOD, conductivity, and temperature were also simulated as state variables. The conductivity results provided a check on the mass balance and the method of entering the inflows to the reservoir model. Emphasis was placed on calculating the sinks of dissolved oxygen in the hypolimnion which could be useful in management decisions. (Sims-ISWS)

THE EFFECT OF AGITATION AND TURBULENCE OF THE GROWTH MEDIUM ON THE GROWTH AND VIABILITY OF MICROCYSTIS,
Orange Free State Univ., Bloemfontein (South Africa). Dept. of Botany.
G. H. J. Kruger, and J. N. Eloff.
Journal of the Limnological Society of Southern Africa, Vol. 4, No. 1, p 69-74, July 1978. 1 fig, 2 tab, 22 ref.

Descriptors: *Algae, *Plant population, *Flowering, *Growth rates, *Turbulence, *Viability, Cultures, Laboratory tests, Impounded waters, Turbidity currents, Light intensity, Laboratory equipment, Velocity.

Because observations of natural blooms of Microcystis suggested that turbulence retarded bloom formation, experiments were performed to investigate the effect of agitation on the growth of Microcystis with respect to the axenic mass culture of this alga in the laboratory, and to examine the ecological effects of turbulence. Laboratory cultures were agitated by means of magnetic stirrers placed under the flasks in which inert magnetic followers were placed. The cultures were agitated at speeds corresponding to linear velocities of 25, 75, 126, 209, and 314 cm sec to the minus one. This turbulence had no adverse effect on the growth of M. UV-007. The linear velocity showed a highly significant correlation with the percentage viability as determined by a plating and serial dilution method. The viability ranged from 0.8% to 99.2% for the stationary cultures and the vigorously stirred cultures, respectively. (Davison-IPA)

COMBINED INFLUENCE OF INFLOW AND LAKE TEMPERATURES ON SPRING CIRCULATION IN A RIVERINE LAKE,
National Water Research Inst., Vancouver (British Columbia). Pacific and Yukon Region.
E. C. Carmack.
Journal of Physical Oceanography, Vol. 9, No. 2, p 422-434, March 1979. 14 fig, 1 tab, 18 ref.

Descriptors: *Lakes, *Canada, *Circulation, *Stratification, Inflow, Discharge(Water), Rivers, Temperature, Water temperature, Density, Spring, Convection, Heat transfer, Mixing, Sampling, Data processing, Mathematical models, Limnology, *Kamloops Lake(British Columbia).

Kamloops Lake is a long (25 km), deep (maximum depth, 145 m) intermontane lake in central British Columbia fed at its eastern end by the Thompson River (mean annual flow, 720 cu m/s). The spring overturn and the onset of stratification were described on the basis of three conceptual models, distinguishing among river-induced, surface-induced, and edge-induced circulations. The lake during winter is characterized by weak reverse stratification; the incoming river waters are less dense than ambient lake water and thus tend to remain at the lake surface. During spring, the shallow river water warms more rapidly than the deep water of the lake; as inflow water warms toward the temperature of maximum density (4C), it becomes denser than lake water and thus tends to sink on entry into the lake. Further warming of the inflow water above 4C decreases its density causing it to again enter the lake as a surface overflow. Although the inflow itself is less dense than lake water, some mixtures of the two will necessarily have temperatures near 4C, and thus be denser than either parent water mass; this process is called cabbeling. The dense mixtures then sink along a narrow frontal zone, filling the lake basin with 4C water from the bottom upward, while new (unmixed) inflow water is held as an arrested wedge near the point of entry. (Sims-ISWS)

SOME STEADY STATE EXACT SOLUTIONS OF THE WIND-DRIVEN CIRCULATION EQUATIONS FOR A RIGID-LID SHALLOW LAKE,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
A. Giorgini.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 206, Price codes: A04 in paper copy, A01 in microfiche. Technical Report No. 116, June 1979. 54 p, 34 fig, 5 ref, 2 append. OWRT A-048-IND (1).

Descriptors: *Lakes, *Winds, Lake breezes, Air circulation, Bathymetry, Shear strength, Lake circulation, Mathematical equations, Navier Stokes Equations.

This study presents a method for solving the lake circulation equations under the rigid-lid approximation and for small shallow lakes. The driving force, simulating the wind, is constituted by a one-directional shear whose intensity may be variable across the lake. The method relaxes the bathymetry as a datum and finds it instead, together with the flow field, by suitable constraints on the flow field itself. The most interesting case of uniform surface shear (uniform wind intensity) is studied for the following subcases: (1) a lake; (2) an underwater hill in an otherwise constant-depth water body of infinite horizontal extent; (3) an underwater pool in an otherwise constant-depth body of infinite horizontal extent.

HYDROLOGICAL SETTING AND WATER QUALITY OF THE URBAN ARTIFICIAL SANDPIT LAKE 'SLOTERPLAS' AT AMSTERDAM,
Vrije Univ., Amsterdam (Netherlands). Inst. of Earth Sciences.
G. B. Engelen, and B. F. M. Kal.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 315-323, 1977. 6 fig, 5 ref.

Descriptors: *Hydrological aspects, *Water quality, *Artificial lakes, *Sand pits, *Water balance, *Sloterplas(Amsterdam The Netherlands), Water pollution, Surface waters, Thermal stratification, Eutrophication, Anaerobic conditions.

The Sloterplas is a lake covering an area of 86 ha with a maximum depth of 38 m, situated in the center of the western post-war extension of the city of Amsterdam, within an independent unit in the water management system--the Sloterpolder. Sources of pollution are street refuse washed into the canals through the sewer system, and the inflow of polluted water from the city center through some sluices. The holomictic lake therefore is eutrophic, which is reflected in occasional algal blooms and anaerobic conditions at the bottom during summer stratification. The investigation conducted from April 1974 to March 1975 examined the water balance of the Sloterpolder, the pattern of water quality in the entire surface water system of the polder, and the evolution of the temperature-oxygen stratification in the Sloterplas. The results lead to discerning seven hydrological units within the Sloterpolder. It is concluded that the eutrophication of the lake and possibly a gradual rise in its salt content are caused by the inflow of only small amounts of strongly polluted water and by the application of fertilizers on horticultural areas and sports grounds. The seven hydrological units differ from each other in land use, the water management system, kind of topsoil, and the hydrochemical influence of the Sloterplas. 2I. Water In Plants

RAINFALL ADDITAMENTS TO SUBSURFACE WATER IN A YOUNG PINE PLANTATION,
West Virginia Univ., Morgantown. Div. of Forestry.
S. J. Tajchman, R. Lee, and E. W. Repa.
Water Resources Bulletin, Vol. 15, No. 2, p 381-386, April 1979. 2 fig, 2 tab, 7 ref.

Descriptors: *Forests, *Rainfall, *Water, Rain, Subsurface waters, Pine trees, Interception, Throughfall, Plant populations, Scotch pine trees, Canopy, Effective precipitation, Gages, *Rhine River, *Gross rainfall, Pine plantation, Forest canopy, Forest ecosystem, Forest density, Trough gages.

Effective rainfall is virtually equal to throughfall under most forest canopies. Average throughfall (as measured in trough gages for a series of rainfall events) increases systematically with distance from tree stems in a young pine plantation. Empirical data suggested that the increase is proportional to the fourth root of distance, but any physical meaning of the relationship is obscure. The relationship may be simply a fortuitous result associated with the curve-fitting operation. It is undoubtedly a function of lead area and canopy structure, but could not be defined in terms of the volume of a conical canopy above observation points. (Roberts-ISWS)

CORN YIELD RESPONSES TO WATER STRESS MANAGEMENT,
North Dakota State Univ., Fargo. Dept. of Agricultural Engineering.
E. C. Stegman, and M. Aflatouni.
Paper No. 78-2558, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, 1978, Chicago, Illinois, 9 p. 8 fig, 3 tab, 18 ref, ASAE, St. Joseph, Michigan.

Descriptors: *Moisture stress, Evapotranspiration, *Crop response, Corn, Moisture deficit, Growth stages, Irrigation systems.

Relative yield (Y/Ymax) vs. relative evapotranspiration (ET/ETmax) functions were defined for major growth periods. These functions also suggested some yield loss may occur due to water stress before an ET depression necessarily also occurs. Relative yield attainment was also related to minimum levels of leaf xylem pressure just prior to stress relief in given growth stages. (Skogerboe-Colorado State)

2J. Erosion and Sedimentation

GRAIN-SIZE DISTRIBUTION OF SUSPENDED LOAD IN RELATION TO BED MATERIALS AND FLOW VELOCITY,
Indian Statistical Inst., Calcutta. Geological Studies Unit.
S. Sengupta.
Sedimentology, Vol. 26, No. 1, p 63-82, February 1979. 13 fig, 3 tab, 22 ref.

Descriptors: *Suspended load, *Flow, *Particle size, *Velocity, Streamflow, Flumes, Sands, Erosion, Sediment transport, Hydraulics, Sediments, Size, Distribution, *Grain-size distribution, Bed materials, Sand beds, Laboratory flume.

Grain-size frequency distributions of suspended loads at different flow velocities and over sand beds of 4 different grain-size patterns were studied in a laboratory flume. The proportion of bed material which went into suspension increased with decrease of grain-size in each case, but the modes of the suspended loads occurred in the size classes intermediate between the coarsest and the finest. With increase of flow velocity, as also with decrease of the bed's mean grain-size, the total amount of material in suspension markedly increased, mainly due to addition of particles to the medium size classes. The coarsest grains in the bed resisted erosion due to their weight, whereas the finest ones were either not available in sufficient quantities or resisted erosion due to their homogeneity. The finest of the erodible grains which were abundantly available in bed were lifted up in large quantities. This size sorting took place at or near the bed surface and was closely related to the process of bed form migration. Large accumulation of medium sized particles in suspension at high velocities led to lognormal grain-size distributions when the nature of the bed (source) material was suitable. At lower velocities, or over other types of bed materials, the phi (log)-probability plots of cumulative grain-size distributions of the suspended loads resolved into a number of straight lines. Mixtures of linear segments on phi-probability graphs, therefore, need not necessarily indicate different modes of sediment transportation, as is commonly believed, but might reflect the conditions of flow and the nature of the source material. Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY4, Proceedings Paper 14502, p 381-392, April 1979. 5 fig, 1 tab, 15 ref, 2 append.

Descriptors: *Beds, *Sediments, *Sand waves, *Model studies, Mathematical models, Dunes, Rivers, Channels, Open channels, Sediment transport, Sands, Flow, Streamflow, Bed load, Sedimentation, Sedimentary dunes, Steepness.

A family of curves was determined for the prediction of the steepness of dunes generated by rivers and open channel flows by using field and laboratory data from various sources. The dune steepness appeared to be determined by two dimensionless variables: the ratio of the existing bed shear stress to the shear stress inducing the inception of sediment transport, and the ratio of the flow depth to the grain size of sediment. It was found that with the increment of the former variable, the dune steepness first increases, then reaches its maximum value, and then progressively decreases as to vanish asymptotically. The increment of the second variable causes only the increment of the dune steepness up to a certain upper limit. (Sims-ISWS)

THE DESIGN OF SEDIMENT BASINS,
Kentucky Univ., Lexington. Dept. of Agricultural Engineering.
A. D. Ward, C. T. Haan, and B. J. Barfield.
Paper No. 78-2086, Presented at the 1978 Summer Meeting of the American Society of Agricultural Engineers, June 27-30, 1978, Logan, Utah, 32 p. 4 fig, 4 tab, 17 ref. ASAE, St. Joseph, Michigan. OWRT B-046-KY(4). 14-34-0001-6081.

Descriptors: *Sediment control, Sediments, *Detention reservoirs, Mine wastes, Regression analysis, Simulation analysis, Computer programs.

Passage of Public Law 95-87 has placed several new restrictions on the design of surface mine sediment basins. It created much controversy as to the required sizing of the sediment basins, and adequate design methods are not available for estimating basin performance and effluent sediment concentrations. This paper presents guidelines as to how the hydrologic parameters affecting sediment basin design may be quantified and contains predictive equations for estimating basin trap efficiency and peak effluent sediment concentrations. Multiple regression analysis techniques were employed with data generated by a hydrograph computer program and by a simulation model. The simulation model has been tested on several actual basins

and appears to give a good estimate of basin performance. It also gave a good estimate of the performance of Callahan Reservoir during a 60-day period in 1973. A new version of the model allows for variation in the particle size distribution with runoff rate. Criteria are presented which account for basins with a permanent pool. Also considered are base flow conditions following a design storm event. (Skogerboe-Colorado State)

Journal of the Fisheries Research Board of Canada, Vol. 36, No. 3, p 241-246, March 1979. 3 fig, 21 ref.

Descriptors: *Sampling, *Lake sediments, *Core drilling, *Research equipment, Underwater, Sediments, Organic matter, Testing procedures, Bottom sediments, Lakes, Reservoirs, Estuaries, Unconsolidated sediments, Soft sediments.

An underwater corer was developed which is capable of taking 10-cm diam cores up to 1 m long from unconsolidated, fine-grained fluvial and lacustrine sediments including organic-rich (gyttja-like) deposits. The corer is lightweight and compact for transport and hand operation from float planes and small boats. It is of the piston type and has a sphincter valve for core retention. A miniature optical sensor triggers the corer when the sediment-water interface is penetrated. The corer is compatible with a system to subdivide the cores by vertical extrusion. The corer will operate under conditions that preclude a diver, especially great water depths. Under moderately calm conditions, the corer will recover cores from unconsolidated deposits, provided they are at least 30 cm or so thick, in such locations as lakes, reservoirs, lagoons, harbors, and estuaries. The lightweight corer gave total C profiles closest to the diver-taken core. (Humphreys-ISWS)

EROSION OF COHESIVE SEDIMENTS AS RATE PROCESS,
Rhode Island Univ., Kingston. Dept. of Civil and Environmental Engineering.
W. E. Kelley, R. C. Gularte, and V. A. Nacci.
Journal of the Geotechnical Engineering Division, American Society of Civil Engineers, Vol. 105, No. GT5, Technical Note, p 673-676, May 1979. 2 fig, 7 ref, 1 append. NSF ENG76-20660.

Descriptors: *Cohesive soils, *Laboratory tests, *Erosion, *Model studies, Sediment transport, Clays, Illite, Sediments, Hydraulic models, Movement, Erosion rates, Grundite.

This study used illitic clay (Grundite) in a water temperature controlled water tunnel. An experimental activation energy of 17 kcal/mole was determined. The experimental activation energies determined compare well with previously published values and suggest that particle interactions are essentially solid to solid. The strength of particle contacts that probably involve a number of bonds will depend on the magnitude of attractive forces that in turn depend on physicochemical factors such as salinity and pH. MULTIPLE-INTENSITY RAINFALL SIMULATOR FOR EROSION RESEARCH ON ROW SIDESLOPES,
Science and Education Administration, Oxford, MS. Sedimentation Lab.
L. D. Meyer, and W. C. Harmon.
Transactions of the American Society of Agricultural Engineers, Vol. 22, No. 1, p 100-103, January-February 1979. 9 fig, 1 tab, 9 ref.

Descriptors: *Rainfall simulators, *Soil erosion, *Research equipment, Simulated rainfall, Equipment, Rainfall intensity, Impact(Rainfall), Sediments, Runoff, Particle size, Erosion, Crops, Agriculture, Agricultural engineering, Row-sideslope erosion.

A rainfall simulator was developed for obtaining data on erosion, runoff, and sediment sizes from rowcrop sideslopes. This research tool can apply a wide range of intensities at impact energies very similar to those of natural rainfall. Results showed that large rates of erosion may occur from row sideslopes and that sediment sizes often differ greatly from soil textural sizes. (Sims-ISWS)

INITIATION OF RIPPLE MARKS UNDER OSCILLATING WATER,
Kyushu Univ., Fukuoka (Japan). Research Inst. for Applied Mechanics.
A. Kaneko, and H. Honji.
Sedimentology, Vol. 26, No. 1, p 101-113, February 1979. 7 fig, 1 tab, 6 ref.

Descriptors: *Ripple marks, *Flow, *Waves(Water), Sand waves, Sediment transport, Hydraulics, Sedimentation, Equations, Mathematical studies, Mathematics, *Oscillating water, Sand beds, Oscillatory boundary layer.

It was observed that a monolayer of glass beads which were scattered sparsely on a rigid plane floor grew into regular waves of particles under oscillatory water flow. The relative displacement of two nearby particles due to viscous fluid forces seems to be responsible for the initiation of these particle waves. It was also observed that the similar particle waves were formed on the initially flat surface of a thick sand bed and subsequently developed into oscillatory sand ripples of a common type. On the basis of these observations, it was suggested that the particle waves may be the basic cause of the initiation of general ripple marks under oscillatory flow. (Lee-ISWS)

ADDRESS OF THE RETIRING PRESIDENT OF THE INTERNATIONAL ASSOCIATION OF SEDIMENTOLOGISTS: DIFFERENCES IN SIZE DISTRIBUTIONS OF POPULATIONS OF PARTICLES AMONG SANDS OF VARIOUS ORIGINS,
Rensselaer Polytechnic Inst. Troy, NY. Dept. of Geology.
G. M. Friedman.
Sedimentology, Vol. 26, No. 1, p 3-32, February 1979. 31 fig, 1 tab, 34 ref.

Descriptors: *Gulf of Mexico, *Texas, *Louisiana, *Mississippi, *Alabama, *New Jersey, *Oklahoma, *Sands, *Distribution, *Reviews, *Data collections, Particle size, Spatial distribution, Rivers, Coasts, Beaches, Dune sands, Sand bars, Statistical methods, Analysis, Size, Gradation, Continental shelf, Analytical techniques, Geomorphology, *Padre Island(TX), *Arkansas River, Size-frequennecy distributions.

This paper reviewed the effect of depositional processes on various parameters of the size-frequency distribution of sands. Movements of air and water generally separate particles by their sizes; the distribution of sizes relates to (1) the availability of different sizes of particles in a parent material, (2) processes operating where the sediments are deposited, particularly the competency of flow, and (3) concentrations of particles in suspension. Differences in size-frequency distributions among sands correlate with various origins, that is with their terminal depositional environments. The paper re-emphasized some points made in previous studies on the interrelationship between textural parameters and depositional processes for beach, dune, and river sands and then complements and supplements data which have not been presented before. These new data were grouped on scatter plots for sands of various origins. Maps presented regional trends of process-induced changes in size distributions of populations of particles in sands of 4 different settings: (1) a beach-dune setting, as exemplified by Padre Island, Texas, on the shores of the Gulf of Mexico; (2) a point-bar setting in the Arkansas River of Oklahoma; (3) a continental shelf-slope setting in the Gulf of Mexico off Louisiana, Mississippi, and Alabama; and (4) a continental shelf setting of the western Atlantic Ocean off New Jersey. The observation was made that the distribution of particles in sands will be influenced by the conditions that determine what happens in the depositional environment, hence statistical parameters that define the size-frequency distribution may be related to formative process. 14C ASSIMILATION IN A TURBID MAN-MADE LAKE,
Orange Free State Univ., Bloemfontein (South Africa). Inst. of Environmental Science.
P. Stegmann.
South Africa Journal of Science, Vol. 74, No. 5, p 189-190, May 1978. 1 fig, 1 tab, 5 ref.

Descriptors: *Photosynthesis, *Turbidity, *Light penetration, *Euphotic zone, *Light intensity, *Impoundments, Silting, Reservoirs, Reservoir silting, Depth, Sampling, Instrumentation, Opacity, Optical properties, Secchi disks, South Africa.

Estimates of the photosynthetic activity, or primary production, were carried out in the turbid impoundment of Verwoerd Dam from January to April 1974 when the volume of the dam and the silt content varied greatly. In clear waters the photosynthetic compensation point occurs at a depth where the light intensity is 1% of the light at the surface. Using axenic algal cultures, active carbon assimilation was found at depths five times greater than the 1% light intensity depth in Verwoerd Dam. Samples were taken at monthly intervals from nine fixed depths at three stations. The 1% light intensity depth varied at this time from 17 to 186 cm; and the Secchi disk reading varied from 4 to 31 cm. It appeared that when the turbidity of the water increased bringing about a decrease in the euphotic zone, high rates of primary production took place well below the 1% light intensity depth. Carbon assimilation, due to natural plankton or microbial populations, did not decrease uniformly with depth, but peaked at two definite depths. Photosynthetic activity above the 1% light intensity depth correlated with the euphotic zone, while photosynthetic activity below the 1% light intensity depth showed no correlation with the measured euphotic zone, indicating that some other mechanism may be responsible for the increased carbon assimilation. The results of the investigation indicate that the depth distribution of the photosynthetic activity in a turbid impoundment is different from that in clear water lakes. (Davison-IPA)

LAKE ERIE NEARSHORE SEDIMENTS, POINT PELEE TO PORT BURWELL, ONTARIO,
Canada Centre for Inland Waters, Burlington (Ontario).
N. A. Rukavina, and D. A. St. Jacques.
Scientific Series No. 99, 1978, 44 p, 10 fig, 42 ref, 3 app.

Descriptors: *Sedimentation, *Sediment transport, *Bottom sampling, *Bathymetry, *Sounding, Geology, Glacial sediments, Mapping, Water levels, On-site tests, Laboratory tests, Photography, *Point Pelee, *Port Burwell, Port Glasgow, Ontario.

Bottom samples, echo-sounder records and underwater photographs were used to map the surficial geology and bathymetry of the Lake Erie nearshore zone (0-20 m) from Point Pelee to Port Burwell, Ontario. Bedrock does not outcrop in the study area. The glacial deposits are exposed

throughout most of the zone between Point Pelee and Rondeau and between Port Glasgow and Port Burwell. Inshore exposures tend to be tills and offshore exposures, glaciolacustrine sediments. Postglacial sediments occur as two major deposits offshore from Point Pelee and Rondeau and as a number of smaller inshore and offshore deposits between Port Glasgow and Port Burwell. The average texture of the postglacial sediment is 1% gravel, 30% sand, 34% silt and 35% clay; average thickness is 4m. Accumulation patterns of littoral sediment and textural trends within the major deposits were used to determine the source and transport directions of the postglacial sediments. Sediment is derived primarily from eroding shore bluffs between Pelee and Rondeau and east of Port Glasgow. Dispersal of the coarse fraction takes place by littoral drift directed towards Pelee, Rondeau and Long Point with reversals just east of Port Alma and at Port Glasgow. Fine grained sediments are moved as suspended load either directly into the basin or alongshore to the points and then basinward. (WATDOC)

SOME ENVIRONMENTAL AND ECONOMIC EFFECTS OF ALTERNATIVE FOREST ROAD DESIGNS,
Intermountain Forest and Range Experiment Station, Bozeman, MT. Forestry Sciences Lab.
R. B. Gardner.
Transactions of the American Society of Agricultural Engineers, Vol. 22, No. 1, p 63-68, January-February 1979. 6 fig, 3 tab, 6 ref.

Descriptors: *Forests, *Roads, *Erosion, Slopes, Slope stability, On-site investigations, Erosion control, Drainage, Sediments, Design, Soils, Trafficability, Costs, Standards, Construction, Effects, Civil engineering.

Esthetic degradation and erosion constitute the major environmental impacts of forest roads. Recent observations from an experimental road in Montana showed that impacts are strongly related to road cross section width: cut slope, road surface and fill slope, and the attendant clearing. To reduce impacts, a single-lane road was constructed to carry all traffic, including log hauling. Hauling was simulated for 3 other road standards and compared with the experimental road. In this instance, where 6,787 cu m (1.5-million board feet) of timber was harvested, the single-lane road was probably the best choice. (Sims-ISWS)

SEDIMENT TEXTURE,
Texas Univ. at Austin, Port Aransas. Geophysical Lab.
E. W. Behrens, B. E. Aleman, K. M. Berg, S. F. Chou, and D. R. Muller.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol. I,' p 7-1 - 7-17, January 15, 1979. 1 fig, 1 tab, 3 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Sediments, *Water pollution sources, *Seasonal, *Variability, Benthos, Environmental effects, Resources development, *Outer Continental Shelf, Substrate, Sediment texture, South Texas Outer Continental Shelf(STOCS).

During 1977, 576 samples representing 6 replicates at each of 25 line and four bank stations sampled during each of 3 seasons (winter, spring, and fall) and 18 miscellaneous samples per season taken for mycological and bacteriological studies were analysed for sediment texture with results reported as mean grain size, standard deviation, skewness, kurtosis (moment parameters) and percentages of sand, silt, clay, and fine clay. The purpose of these data was to provide substrate textural data for benthic organism studies. The samples also provided analyses of textural variability which generally increased from a low at the outer shelf edge to a maximum just seaward of the boundary between shoreface sands and offshore muddy bottoms and then decreased again as sand became dominant shoreward. Five stations are interpreted as having significant seasonal changes. The most consistent pattern seems to have been a general coarsening in muddy sand bottoms of the inner shelf especially between winter and spring sampling. This supports a suggestion of this trend observed in 1976; but a similar trend on the outermost shelf observed in 1976 was poorly supported. (See also W79-07287) (Sinha-OEIS)

MODEL STUDIES AID POND DESIGN,
Kentucky Univ., Lexington. Dept. of Agricultural Engineering.
A. D. Ward.
Water and Wastes Engineering, Vol. 16, No. 5, p 36-38, May 1979. 2 fig, 2 tab.

Descriptors: *Reservoir silting, *Trap efficiency, *Ponds, *Maryland, *Mathematical models, Deposition(Sediments), Sediment control, Model studies, Hydrographs, Hydraulics, Equations, Estimating equations, Analytical techniques, Sediment transport, Sediment discharge, Detention reservoirs.

Design methods for estimating performance of small ponds suitable for variable flow or storm events have been developed during several ongoing research projects at the Agricultural Engineering Department at the University of Kentucky. Most current methods for estimating performance of small ponds are only suitable for application during steady flow conditions. A conceptual model has been developed which simulates the sedimentation process in reservoirs and sediment detention structures. The Deposits model estimates the trap efficiency of the pond and simulates sediment outflow concentrations as a function of basin geometry, sediment physical properties, inflow hydrograph, inflow sedimentgraph, and basin hydraulic characteristics. Sediment accumulations in the pond and the effects of reduced storage volume on pond performance may also be evaluated. Inputs are few, and virtually no calibration is required. A number of verification studies have been conducted with the model, and in all cases it gave good estimates of basin performance. The types of structures evaluated included a small agricultural reservoir in Missouri, several surface mine ponds in the Appalachian Coal Province, and a sediment pond a stormwater retention pond in Maryland. Journal of Soil and Water Conservation, Vol. 34, No. 2, p 96-98, March-April 1979. 4 fig, 2 tab, 11 ref.

Descriptors: *Soil erosion, *Nutrients, *Farm management, *Southeast US, *Oregon, *Corn Belt, Nitrogen, Phoshorus, Potassium, Erosion, Erosion control, Runoff, Wind erosion, Nutrient removal, Crops, Agriculture, *Residue removal, *Crop residue.

Crop residues contain plant nutrients that must be replaced if the residues are removed from the field. Removal of crop residues will increase wind and water erosion, and the eroded sediment will carry plant nutrients with it. The combined nutrient removal in residues and erosion under existing cropping practices would be greater in the Corn Belt than in the Southeast, central Oregon, or the Great Plains. (Sims-ISWS)

minum, *New York, *New Hampshire, Watersheds(Basins), Lakes, Mountains, Soils, Forests, Chemistry of precipitation, Fish, Toxicity, Fish toxins, *White Mountains(NH), *Adirondacks(NY).

Atmospheric inputs of sulfuric acid and nitric acid to noncalcareous higher-elevation watersheds in the White Mountain and Adirondack regions lead to comparatively high concentrations of dissolved aluminum in surface and groundwaters. This phenomenon appears to result from modern increases in soil aluminum leaching. Transport of this aluminum to acidified lakes can lead to fish mortality. Combined results from areas of silicate bedrock in the United States and Europe suggest that aluminum represents an important biogeochemical linkage between terrestrial and aquatic environments exposed to acid precipitation. OCCURRENCE AND STABILITY OF CALCITE IN THE MAUMEE RIVER,
Ohio Agricultural Research and Development Center, Wooster. Dept. of Agronomy.
D. B. Green, and N. E. Smeck.
Journal of Environmental Quality, Vol. 8, No. 2, p 182-188, April-June 1979. 4 fig, 4 tab, 17 ref.

Descriptors: *Calcite, *Chemical precipitation, *Rivers, *Ohio, Sampling, Chemicals, Chemical analysis, Calcium, Carbon dioxide, Dolomite, Algae, Suspended solids, Crystals, Chemistry, Water chemistry, *Maumee River(OH).

The occurrence of secondary (precipitated) calcite and the concentrations of parameters controlling calcite dissolution-precipitation were monitored at 6 sites in the Maumee River drainage system during 1975-76. Secondary calcite was identified on the basis of calcite/dolomite ratios as determined by X-ray diffraction and a volumetric procedure employing the Chittick apparatus. Additional evidence for the occurrence of secondary calcite as well as crystal morphology was obtained by optical microscopy. A positive correlation between high calcium concentrations and the occurrence of secondary calcite could not be established; however a relationship between algal blooms and calcite formation was noted. It was concluded that a reduction in the CO2 content of the stream due to algal biomass production is the factor responsible for initiating calcite precipitation in the Maumee River system. Calcite equilibria in the stream are quite dynamic, with secondary calcite appearing and disappearing in relatively short periods of time. (Sims-ISWS)

BORON DISTRIBUTION IN SOILS AND WATERS OF EGYPT,
Alexandria Univ. (Egypt). Dept. of Soil and Water Science.
A. A. Elseewi, and A. E. Elmalky.
Soil Science Society of America Journal, Vol. 43, No. 2, p 297-300, March-April 1979. 4 fig, 3 tab, 17 ref.

Descriptors: *Boron, *Soils, *Water, Sampling, Chemicals, Chemical analysis, Rivers, Irrigation water, Soil water, Salinity, Chlorides, Acids, Foreign countries, Foreign research, Calcium carbonate, Hydrogen ion concentration, Soil texture, Soil science, *Nile River(Egypt), *Egypt.

Saturation extract, hot water-soluble, acid-soluble, and total B fractions were determined in soil samples from profiles representing 6 geographically diverse areas in Egypt. Saturation extract and hot water-soluble B averaged 0.6 microgram/milliliter and 1.3 microgram/gram. Acid-soluble and total B averaged 10.2 and 113 microgram/gram. The acid fraction showed a curvilinear relationship with CaCO3 content of the soil, and averaged 12.5% of the total B. Total B, on the average, was twice as high in clay samples as in sandy samples, and decreased by about 32% beyond the 60-cm depth of the soil profile. Concentrations of saturation extract B were either similar to or a reasonable multiple of Nile-Water B, indicating that the latter is a direct source of at least water soluble B in these soils. Concentrations of water and acid-soluble B suggest that B status in soils of Egypt is above the sufficiency level, and that under proper soil and water management the incidence of toxicity is unlikely. PHOSPHORUS SUPPLYING CAPACITIES OF PREVIOUSLY HEAVILY FERTILIZED SOILS,
Universidade Federal de Vicosa (Brazil). Dept. of Soils.
R. Novais, and E. J. Kamprath.
Soil Science Society of America Journal, Vol. 42, No. 6, p 931-935, November-December, 1978. 3 fig, 7 tab, 22 ref.

Descriptors: *Phosphorus, Soil tests, Soil chemistry, Fertilizers, *Nutrient removal, Chemical analysis, Soil analysis.

Four Coastal Plain soils and one Piedmont soil heavily fertilized in the past were intensively cropped in greenhouse pots to determine changes in extractable soil P as measured by North Carolina, Bray I and Olsen extractants. Slopes relating changes in extractable P with P removed by cropping were very similar for the three sandy soils. Changes in extractable P with the North Carolina and Bray I extractants were correlated with P buffer capacity, % clay, and soil surface area. The principal source of P removed by cropping was NH4F-P in sandy Coastal Plain soils; NH4F-P and NaOH-P supplied equal amounts in the clayey Piedmont soil. Sandy Coastal Plain soils which originally contained more than 74 ppm North Carolina extractable P and 71 ppm Bray I extractable P supplied 82 to 108 kg P/ha to nine crops of pearl millet (Pennisetum americanum, cv. Gahi-1). (Skogerboe-Colorado State)

THE NITROGEN-15 ABUNDANCE IN A WIDE VARIETY OF SOILS,
Washington Univ., St. Louis, MO. Center for the Biology of Natural Systems.
G. Shearer, D. H. Kohl, and S-H. Chien.
Soil Science Society of America Journal, Vol. 42, No. 6, p 899-902, November-December, 1978. 1 fig, 6 tab, 13 ref.

Descriptors: *Nitrogen, Fertilizers, *Soil chemistry, Sampling, Correlation analysis.

One hundred thirty-nine soil samples from 20 states were analyzed for 15N abundance. Soil characteristics and environmental conditions at the sampling sites varied widely. The total N of surface soil samples had a mean delta 15N value (per mill 15N excess) slightly but significantly higher than the mean value for soils collected from deeper layers, although the relationship between delta 15N and soil depth was not consistent from location to location. Differences among mean delta 15N values for the total N of soil samples collected from cropland, pasture, uncultivated land (with native herbs), and forest were not striking. There was no systematic effect of variation in the rate of application of N fertilizer on the delta 15N of the total N of soils. The mean delta 15N value of surface soils, with respect to atmospheric N, was +9.22 and the standard deviation was 2.10 delta 15N units. The range within which 90% of the samples fell was +5.1 to +12.3 delta 15N units. Less than half of the variation among the soils in delta 15N of the total N could be accounted for by differences in environmental variables or soil characteristics. (Skogerboe-Colorado State)
W79-07494

NITROGEN MINERALIZATION AND DENITRIFICATION IN ORGANIC SOILS,
Cornell Univ., Ithaca, NY. Dept. of Soil Organic Chemistry.
T. F. Guthrie, and J. M. Duxbury.
Soil Science Society of America Journal, Vol. 42, No. 6, p 908-912, November-December, 1978. 1 fig, 6 tab, 13 ref.

Descriptors: *Nitrogen, *Denitrification, *Organic soils, Nitrates, Leachate, Laboratory tests.

The quantities of N mineralized when columns of Histosols were incubated at field capacity for periods up to 28 days corresponded to 500-600 kg N/ha per year without correction for N lost by denitrification. An absorption train utilizing molecular sieve 5A to collect N20 was used in denitrification experiments. Under an argon stream, 52-53% of the added NO3(-)-N was recovered as N2O, whereas the maximum concentration of N2O accumulating in the headspace of closed vessels amounted to 65% of the added NO3(-)-N. The quantity of N2O either collected or accumulating in a headspace was reduced to 15-41% of the NO3(-)-N denitrified when a second addition of NO3(-) was made to the soils. Denitrification occurred in both drained and flooded soil columns amended with NO3(-). The N2O recovered ranged from 2.5-9% and 9-19% of the NO3(-)-N denitrified in the drained and flooded columns, respectively. From 78-98% of the N2O was recovered in leachate from the flooded columns and the corresponding range for the drained columns was 11-52%. (Skogerboe-Colorado State)

NITRATE REDUCTION TO AMMONIUM IN ANAEROBIC SOIL,
Louisiana State Univ., Baton Rouge. Center for Wetland Resources.
R. J. Buresh, and W. H. Patrick, Jr.
Soil Science Society of America Journal, Vol. 42, No. 6, p 913-918, November-December, 1978. 3 fig, 3 tab, 32 ref.

Descriptors: *Nitrates, Reduction(Chemical), Anaerobic conditions, *Denitrification, Nitrogen, Oxidation-reduction potential, *Soil chemistry.

The objectives were: (1) to compare the influence of various C substrates upon the extent of NO3(-) reduction to NH4(+) relative to denitrification in anaerobic soil, and (2) to determine the significance of NO3(-) conversion to NH4(+) and organic N in unamended anaerobic soil. Ammonium accumulates by way of mineralization under anaerobic conditions, consequently 15N-labelled NO3(-) was employed to distinguish between soil and NO3(-)-derived NH4(+). It was concluded that transformation of significant amounts of NO3(-) to NH4(+) and organic N required intensely reduced soil conditions. The reaction was apparently not suppressed by NH4(+). Evidence indicated that NO3(-) was reduced to NH4(+) by a nonassimilatory pathway in which NO3(-) functioned as a terminal electron acceptor. (Skogerboe-Colorado State)

SURFACE CHARGE MANIPULATION IN CONSTANT SURFACE POTENTIAL SOIL COLLOIDS: II. EFFECT ON SOLUTE TRANSPORT,
Hawaii Univ., Honolulu. Dept. of Agronomy and Soil Science.
S. S. Wann, and G. Uehara.
Soil Science Society of America Journal, Vol. 42, No. 6, p 886-888, November-December, 1978. 6 fig, 2 tab, 6 ref.

Descriptors: *Ion transport, Ion exchange, Colloids, Nutrient removal, Potassium, Phosphorus, Isotherms, *Solutes.

Potassium breakthrough curves from soil columns containing samples collected from an oxic horizon of a Typic Torrox shifted to the right as the sample was treated with increasing levels of P. The shift in the breakthrough curve was significantly related to

a lowering of the zero point of charge. The lowering of the zero point of charge was in turn related to levels of applied P. The anion accompanying K also had a marked effect on the position of the breakthrough curve. When the accompanying anion was Cl, S, and P respectively, the K concentration in the effluent attained one-half of influent concentration at 4.25, 5.30, and 8.20 pore volumes. A water pollution prediction system using the finite element method was developed at the request of the Transportation Ministry of Japan which controls the national waters and harbors. As a practical numerical method, considering the accuracy and the computing time of a computer, an explicit finite element method and the steady dispersion method were used. This system was used to simulate the distribution of pollutants in Osaka Bay and the Seto Inland Sea, and its effectiveness was confirmed by objective data. (Sims-ISWS)

Descriptors: *Mathematical models, *Model studies, *Finite element analysis, *Saline water intrusion, *Saline water-freshwater interfaces, *Estuaries.

Mathematical and physical modeling techniques are used to study the dynamics of salinity intrusion in partially stratified estuaries when the residual gravitational circulation is the primary mechanism for longitudinal dispersion and salt transport. Emphasis is placed on quantifying the effect of transverse variations in channel depth on the three dimensional circulation patterns and the coupled salinity distribution. Solutions are obtained using perturbation and finite element methods for the three dimensional residual gravitational circulation velocity and salinity distributions in estuaries of constant nonrectangular prismatic cross section. The resulting longitudinal dispersion coefficients representing salt transport by the residual gravitational circulation are computed and used to develop an one dimensional salt transport equation. The theoretical and experimental results indicate that transverse variations in channel depth have a significant effect upon the circulation patterns and salinity distributions in partially stratified estuaries; and that the results of theories developed for rectangular cross section channels and laboratory studies conducted in rectangular cross section channels cannot in general be extrapolated to real estuaries. SUBTIDAL SEA LEVEL VARIATIONS IN THE CHESAPEAKE BAY AND RELATIONS TO ATMOSPHERIC FORCING,
Johns Hopkins Univ., Baltimore, MD. Chesapeake Bay Inst.
D-P. Wang.
Journal of Physical Oceanography, Vol. 9, No. 2, p 413-421, March 1979. 14 fig, 15 ref. NSF OCE74-08463, OCE77-20254.

Descriptors: *Chesapeake Bay, *Sea level, *Variability, Winds, Storms, Wind tides, Weather, Storm surge, Water levels, Measurement, Data processing, Time series analysis, Water circulation, Bays, Coasts, Estuaries, Oceanography, Subtidal sea level variations, Atmospheric forcing.

Subtidal sea level variations in the Chesapeake Bay were examined over a one-year period for evidence of wind-driven barotropic circulation. The major transport occurred at time scales of 3-5 days, whose magnitude was larger than the river runoff. It was driven by the east-west wind, as part of the coupled coastal ocean-estuary response. At shorter time scales, there was also large barotropic motion which, however, was driven by the local, north-south wind. The variance of barotropic fluctuation was larger by a factor of 4 in winter than in summer, due to the increased cyclone activities. The coupled coastal ocean-estuary response was also more pronounced in winter. In contrast, the summer season was dominated by local forcing at time scales of 3-7 days. The results suggested that the barotropic motion is an important component of the net circulation. The corresponding subtidal sea level change contributes significantly to the storm surge. Thus, the nature of barotropic response, particularly the coupled response, must be examined carefully for better understanding of the dispersion processes and storm surges in Chesapeake Bay. ISOTOPIC ABUNDANCES OF LEAD IN ESTUARINE SEDIMENTS, SWANSEA BAY, BRISTOL CHANNEL,
Institute for Marine Environmental Research, Plymouth (England).
E. I. Hamilton, and R. J. Clifton.
Estuarine and Coastal Marine Science, Vol. 8, No. 3, p 271-278, March 1979. 3 fig, 1 tab, 15 ref.

Descriptors: *Lead, *Estuaries, *Isotope studies, *Sediments, Radioactivity, Dating, Radioactive dating, Heavy metals, Pollutants, Data collections, Sedimentation, On-site investigations, Foreign research, *United Kingdom, *Bristol channel(UK), Geochronology.

A historical record for the deposition of lead in Swansea Bay, Bristol Channel, United Kingdom, has been determined together with isotopic compositions. Analysis of the isotopic composition of lead in cores, dated by 210Pb-210Po chronology, illustrated a post 1850 influx of lead originating from technically produced materials. Since 1850 there has been a three-fold increase of lead in sediments of which only 25-30% can be accounted for from technical sources; the remainder is presumed to be derived from working of the South Wales Coal Measures. (Humphreys-ISWS)

LEAD-210 CHRONOLOGY IN RELATION TO LEVELS OF ELEMENTS IN DATED SEDIMENT CORE PROFILES,
Institute for Marine Environmental Research, Plymouth (England).
R. J. Clifton, and E. I. Hamilton.
Estuarine and Coastal Marine Science, Vol. 8, No. 3, p 259-269, March 1979. 7 fig, 1 tab, 11 ref.

Descriptors: *Estuaries, *Lead, *Sediments, *Radioactivity, On-site investigations, Heavy metals, Zinc, Copper, Cores, Dating, Sedimentation rates, Foreign research, Sampling, Testing, *United Kingdom, *Severn Estuary(UK), *Tamar Estuary(UK), Geochronology.

This paper described the use of 210Pb-210Po chronology to determine sedimentation rates in the Severn (Swansea Bay, Bridgwater Bay, Newport Deep) and Tamar estuaries of the United Kingdom. Samples taken from Swansea Bay and the Tamar showed a significant decrease in the specific radioactivity of 210Pb with depth, while samples from Newport Deep and Bridgwater Bay did not show this feature--instead the 210Pb activity tended to be constant. Attempts were made to confirm the derived sedimentation rates using other data such as lead isotopic compositions and the industrial history of the areas. These attempts were partially successful, but there is still a need for an unequivocal means of confirmation. (Humphreys-ISWS)

ORGANIC CARBON ISOTOPE RATIOS IN RECENT SEDIMENTS IN THE ST. LAWRENCE ESTUARY AND THE GULF OF ST. LAWRENCE,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia).
F. C. Tan, and P. M. Strain.
Estuarine and Coastal Marine Science, Vol. 8, No. 3, p 213-225, March 1979. 5 fig, 4 tab, 29 ref.

Descriptors: *Organic matter, *On-site investigations, *Estuaries, *Canada, Carbon, Radioisotopes, Sediments, Analysis, On-site data collections, Isotope studies, Analytical techniques, Statistical methods, Sampling, Testing, Methodology, *Gulf of St Lawrence, *St Lawrence Estuary, Organic carbon.

The distribution of 13C in the organic fraction of surface sediments was determined in order to examine the relative contributions of terrestrial and marine organic carbon to sediments in the St. Lawrence Estuary, Saguenay Fjord, and the Gulf of St. Lawrence, Canada. The delta 13C results showed that the organic matter deposited within the Saguenay Fjord (-25.9 + or - 0.4 parts per thousand) and the upper St. Lawrence Estuary (-25.0 + or - 0.6 parts per thousand) is of terrestrial origin. The variability of delta 13C values observed in sediments from the lower St. Lawrence Estuary (-25.6 to -21.8 parts per thousand) suggests the presence of organic matter from both terrestrial and marine sources. Remarkably uniform values were observed in the open Gulf of St. Lawrence (-22.4 + or - 0.2 parts per thousand). On the basis of delta 13C studies, it was concluded that terrestrial organic matter from the St. Lawrence drainage basin is deposited within the lower St. Lawrence Estuary and that the organic matter in the open Gulf of St. Lawrence is of local or other marine origin. The use of carbon isotope ratios to delineate the extent of terrestrial organic carbon in

sediments was briefly compared with the use of C/N ratios and lignin concentrations. The delta 13C values from the study area fall within the range observed by other workers from other areas. (Humphreys-ISWS)

DIFFRACTION OF WATER WAVES BY ISOLATED STRUCTURES,
State Univ. of New York at Buffalo. Dept. of Civil Engineering.
V. W. Harms.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol. 105, No. WW2, Proceedings Paper 14561, p 131-147, May 1979. 12 fig, 28 ref, 2 append.

Descriptors: *Waves(Water), *Ocean waves, *Offshore platforms, *Model studies, Mathematical models, Laboratory tests, Hydraulic models, Structures, Shore protection, Islands, Coasts, Beaches, Oceans, Hydrodynamics, Coastal engineering, Artificial islands, Wave diffraction.

A diffraction theory based upon the method of Green functions was presented and compared to existing exact solutions and an approximate one. The solution was obtained by approximating an integral equation for the wave potential by a set of linear equations. Wave-height distributions were analyzed in order to determine the affect of structure geometry upon the diffraction process. The wave-height topography in the wave-lee of four separate, geometrically-different cylinders (of the same size) was calculated and compared to laboratory measurements. The distance was established beyond which the wave-height topography is independent of the geometrical features of the wave-diffracting obstacle. Laboratory measurements were performed in the wave-lee region from 1/2 to 20 wavelengths from the structure. At large distances from the structure, experimental wave heights were significantly greater than indicated by theory. (Sims-ISWS)

NONLINEAR MODELING OF WAVE RUNUP ON SLOPING BEACH,
Delaware Univ., Newark. Dept. of Civil Engineering.
J. N. Sharma.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol. 105, No. WW2, Proceedings Paper 14564, p 125-129, May 1979. 2 fig, 3 ref, 2 append.

Descriptors: *Waves(Water), *Ocean waves, *Beaches, *Model studies, Mathematical models, Correlation analysis, Probability, Equations, Wave runup, Autocorrelation, Spectral analysis, Nonlinear systems.

A new method of identifying nonlinear systems has been developed and applied to the wave runup process. The new method consists of estimating the parameters of the nonlinear system through the known relation between the correlation functions of the input and output records. The unknown function representing the nonlinear system is expanded into a series of Hermite polynomials. The output autocovariances are expressed in terms of the input autocorrelations and the unknown system function. This provides as many equations as there are autocovariance estimates. From these equations, the parameters of the function representing the nonlinear system were estimated. The autocorrelations and spectral density were computed by using the nonlinear model and compared with the actual autocorrelation and spectral density of the measured output. The predictions are reasonably close to the observations. Results presented indicate the possibility of representing the surf zone as a nonlinear system. (Sims-ISWS)

JOINT OCCURRENCES IN COASTAL FLOODING,
North Carolina State Univ. at Raleigh. Dept. of Marine Science and Engineering.
M. A. Tayfun.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol. 105, No. WW2, Proceedings Paper 14560, p 107-123, May 1979. 10 fig, 8 ref, 2 append.

Descriptors: *Coastal plains, *Flooding, *Probability, Floods, Coasts, Hurricanes, Tides, Storm surge, Tsunamis, Flood waves, Winds, Design flood, Mathematical models, Statistics, Statistical models, Statistical methods, Analytical techniques.

Extreme levels of coastal flooding arising from the joint occurrence of a rare event, such as a hurricane or a tsunami with the astronomical tide, have a stochastic nature resulting from the random occurrence of the primary event relative to the phase of the astronomical tide. Numerical means of computing the frequencies of peak flood levels by constructing equally likely combinations of tides with the record of a rare event are costly and impractical to apply. This paper presented an approximate analytic approach to construct the probability structure of extremal crest heights arising from such joint occurrences based on simple astronomical tide models. Examples were given to illustrate application to tsunamis and storm surges. (Sims-ISWS)

THE ZOOPLANKTON OF MGAZANA, A MANGROVE ESTUARY IN TRANSKEI, SOUTHERN AFRICA,
Port Elizabeth Univ. (South Africa). Dept. of Zoology.
T. Wooldridge.
Zoologica Africana, Vol. 12, No. 2, p 307-322, 1977. 3 fig, 6 tab, 8 ref.

Descriptors: *Estuaries, *Mgazana(Transkei South Africa), *Zooplankton, *Copepods, Plankton, Aquatic animals, Invertebrates, Biomass, Aquatic habitats, Sampling, Estuarine environment, Nets, Plankton nets, Equipment.

Zooplankton samples were taken at 11 stations at six-week intervals from May 1972 to March 1973 at Mgazana, a mangrove estuary in Transkei. In the middle and lower estuary salinities were consistently above 25 parts/thousand; salinity in the upper estuary varied between 4 and 29 parts/thousand. Water temperatures varied from 15.5C to 28C. During the sampling 115 taxa of zooplankton organisms were recorded. The zooplankton in the mouth of the estuary was very diversified. Population densities for the copepods, Acartia natalensis and Oithona brevicornis, of over 100,000/m3 of water were recorded. The total zooplankton biomass, relatively low in winter, increased markedly from October. The maximum biomass of 1,200 mg/m3 recorded in February in the middle estuary was attributed to the mysid Mesopodopsis africana. Mysids, major contributors to the biomass, showed definite seasonal and spatial distribution patterns in the estuary. (Davison-IPA)

Journal of the Waterway, Port, Coastal and Ocean Division, Vol. 105, No. WW2, Proceedings Paper 14582, p 171-189, May 1979. 15 fig, 2 tab, 13 ref, 1 append.

Descriptors: *Drag, *Loads(Forces), *Anchors, Waves(Water), Ocean waves, Offshore platforms, Energy, Hydrodynamics, Hydraulic models, Laboratory tests, Analytical techniques, Hydraulic models, Laboratory tests, Analytical techniques, Oceanography, Engineering, Acceleration, Intertia.

Experimental results for the drag coefficient and the added hydrodynamic mass coefficient for block bodies, plates, and models of deadweight anchors were presented. A unique method was examined for eliminating noise from an analog signal that relates to the analysis of the recorded forces and for determining the drag and inertia coefficients in the frequency domain. Results from a regression analysis to determine the drag coefficients and hydrodynamic mass coefficients were presented and compared to the other method employed. The experiments showed that both the added mass and the drag coefficients are dependent upon the ratio of the amplitude of the water particle excursion to the major dimension of the body. (Sims-ISWS)

DESIGN CRITERIA FOR FLOATING TIRE BREAKWATERS,
State Univ. of New York at Buffalo.
V. W. Harms.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol. 105, No. WW2, Proceedings Paper 14570, p 149-170, May 1979. 23 fig, 13 ref, 1 append.

Descriptors: *Breakwaters, *Coastal engineering, *Waves(Water), Shore protection, Marinas, Ocean waves, Coasts, Barriers, Floating, Loads(Forces), Engineering, Floating breakwaters, Tire breakwaters, Tires, Floating bodies.

Wave-transmission and peak-mooring force design curves were generated for the Goodyear and Wave-Guard floating tire breakwaters from measurements on 1/8-scale and 1/4-scale models using regular and irregular waves and were found to be in good agreement with available full-scale data. These curves may be used to determine the breakwater size needed to attenuate a given regular design wave to an acceptable level, and also to determine the maximum mooring load associated with this. A simple semi-empirical energy-dissipation model was developed and found to simulate measured wave-transmission characteristics with sufficient precision to be useful in many engineering applications; e.g., the ratio of transmitted to incident wave height is stated as an exponential function of wave steepness, ratio of wavelength to breakwater-beam-size, breakwater porosity, and a drag coefficient. An empirical relationship for the peak mooring force was obtained. (Sims-ISWS)

Journal of Geophysical Research, Vol. 84, No. C4, p 1797-1808, April 20, 1979. 4 fig, 3 tab, 24 ref. NOAA/AOML 03-6-022-35220.

Descriptors: *Waves(Water), *Mathematical models, *Theoretical analysis, *Boundaries(Surfaces), Model studies, Analytical techniques, Coasts, Currents(Water), Shear stress, Fluid friction, Roughness(Hydraulic), Flow resistance, Surfaces, Sediment transport, Water circulation.

An analytical theory was presented to describe the combined motion of waves and currents in the vicinity of a rough bottom and the associated boundary shear stress. Characteristic shear velocities were defined for the respective wave and

current boundary layer regions by using a combined wave-current friction factor, and turbulent closure was accomplished by employing a time invariant turbulent eddy viscosity model which increases linearly with height above the seabed. The resulting linearized governing equations were solved for the wave and current kinematics both inside and outside the wave boundary layer region. For the current velocity profile above the wave boundary layer, the concept of an apparent bottom roughness was introduced, which depends on the physical bottom roughness as well as the wave characteristics. The net result is that the current above the wave boundary layer feels a larger resistance due to the presence of the wave. The wave-current friction factor and the apparent roughness are found as a function of the velocity of the current relative to the wave orbital velocity, the relative bottom roughness, and the angle between the currents and the waves. In the limiting case of a pure wave motion, the predictions of the velocity profile and wave friction factor from the theory were shown to give good agreement with experimental results. The reasonable nature of the concept of the apparent bottom roughness was demonstrated by comparison with field observations of very large bottom roughnesses by previous investigators. The implications of the behavior predicted by the model on sediment transport and shelf circulation models were discussed. (Humphreys-ISWS)

POLLUTION HISTORY OF THE SAVANNAH RIVER ESTUARY,
Scripps Institution of Oceanography, La Jolla, CA.
E. D. Goldberg, J. J. Griffin, V. Hodge, M. Koide, and H. Windom.
Environmental Science and Technology, Vol. 13, No. 5, p 588-594, May 1979. 4 fig, 4 tab, 16 ref. NRC AT(49-24)-036.

Descriptors: *Estuaries, *Pollutants, *Metals, *Georgia, *History, Data collections, On-site investigations, Sediments, Salt marshes, Plutonium, Radioisotopes, Sampling, Evaluations, Cores, Analysis, Cesium, Lead, Zinc, Chromium, Copper, Cobalt, Nickel, Manganese, Aluminum, Iron, Vanadium, Effects, *Savannah River(GA), Geochronology.

Records of natural and pollutant fluxes to the Savannah River estuarine system are found in some river and marsh deposits into which time frames can be introduced by 210Pb or plutonium geochronologies. Plutonium releases from the Savannah River Plant to the environment are evident in only one deposit and in marsh grass, both of which have elevated levels of the 238Pu/(239 + 240)Pu ratios in comparison to those expected from atmospheric fallout. The highest concentrations of metals were found in deposits upriver; in sediments of the estuary itself, lower concentrations of the metals resulted from their dilution through the entry of oceanic solid phases. The impact of man upon the composition of Savannah River is recorded in its deposits. Increased levels of lead, chromium, and vanadium, well-recognized pollutants, in the recently deposited strata provide the evidence for this argument. (Humphreys-ISWS)

ENVIRONMENTAL POLY(ORGANOSILOXANES) (SILICONES),
Naval Research Lab., Washington, DC. Ocean Sciences Div.
R. Pellenbarg.
Environmental Science and Technology, Vol. 13, No. 5, p 565-569, May 1979. 2 fig, 3 tab, 23 ref. NSF-OCE-77-2079.

Descriptors: *Pollutants, *Polymers, *Estuaries, *Potomac River, *Chesapeake Bay, *Delaware, *New Jersey, Sediments, Cores, Sampling, Analysis, Evaluation, Bays, Analytical techniques, Testing, Methodology, *Delaware Bay, Silicones.

Poly(organosiloxanes) (silicones), which are totally synthetic polymers, were measured in the sediments of the Potomac River, Washington, D.C., and Delaware Bay, Delaware-New Jersey. The Potomac sediments exhibited an average of 1.38 ppm (range 0.46-3.07 ppm) of extractable silicone. The Bay sediments showed an average of 0.61 ppm (range 0.10-1.56 ppm) of extractable silicone. Data from both locations are based on a 35% recovery efficiency for the solvent extraction technique using diethyl ether to recover silicones from dried solids. Extracts, converted to methyl isobutyl ketone solution, were analyzed by nitrous oxide-acetylene flame atomic absorption spectrophotometry. Furthermore, the aqueous surface microlayer in a boat harbor on the Chesapeake Bay contained an average of 30 ppb of silicone, and microlayer from Delaware Bay contained an average of 34 ppb of silicone. All data are on a weight/weight basis, and are reported as organic silicon. Due to the ubiquitous occurrence of silicones seen in this study, silicones are offered as excellent tracers for anthropogenic additions to the environment. (Humphreys-ISWS)

OBSERVATIONAL EVIDENCE FOR VERTICAL DIFFUSION DRIVEN BY INTERNAL WAVES OF TIDAL ORIGIN IN THE OSLOFJORD,
Goteborg Univ. (Sweden). Dept. of Oceanography.
A. Stigebrandt.
Journal of Physical Oceanography, Vol. 9, No. 2, p 435-441, March 1979. 3 fig, 4 tab, 9 ref.

Descriptors: *Fjords, *Internal waves, *Model studies, *On-site investigations, Sampling, Water circulation, Tidal waters, Currents(Water), Temperature, Water temperature, Density, Mathematical models, Estuaries, Coasts, *Norway, *Oslofjord(Norway).

In an earlier paper, a model was proposed for internal wave-induced vertical mixing in a sill fjord. The observational evidence for the theory at that time was rather sparse, but the void was materially filled by observations presented in this note. Current measurements showed, in accordance with the theory, that progressive internal waves radiate out from the Drobak sill in the Oslofjord. An experiment with tracer dye below the sill depth in the same fjord showed that the coefficient of vertical diffusion of the tracer was an order of magnitude less than the overall coefficient for vertical diffusion of density during the same period. This finding, indicating large horizontal inhomogeneities in the mixing field, gives strong support to the mixing model proposed in the earlier paper. (Sims-ISWS)

AN ECOPHYSIOLOGICAL STUDY OF THE MEIOFAUNA OF THE SWARTKOPS ESTUARY. 1. THE SAMPLING SITES: PHYSICAL AND CHEMICAL FEATURES,
Port Elizabeth Univ. (South Africa). Dept. of Zoology.
A. H. Dye.
Zoologica Africana, Vol. 13, No. 1, p 1-18, 1978. 9 fig, 3 tab, 22 ref.

Descriptors: *Estuaries, *Swartkop estuary(South Africa), *Physical properties, *Chemical properties, *Sampling, *Estuarine environment, Aquatic animals, Invertebrates, Porosity, Permeability, Temperature, Nitrogen, Oxygen, Salinity, Chlorophyll, Particle size, Tidal waters, Tidal effects.

Chemical and physical features of the two beaches in the Swartkops estuary were monitored at monthly intervals over a 14-month period for temperature, nitrogen, chlorophyll a, oxygen, and salinity. Measurements were made of sand particle size, porosity, permeability, and desiccation. The environmental conditions were most severe at the higher tidal levels and in the upper reaches of the estuary. Nitrogen and chlorophyll a varied greatly from month to month; salinity and temperature were highest in the summer and lowest in winter, or during floods; oxygen tensions were highest in winter and lowest in summer, except where desiccation occurred and air replaced water in the substrate. The presence of sand prawns, Callianassa kraussi, influenced the oxygenation and water circulation of the deeper sediments adjacent to their burrows. It is suggested that macrofaunal organisms with burrows extending from the surface have similar effects. (See also W79-07349) (Davison-IPA)
W79-07348

AN ECOPHYSIOLOGICAL STUDY OF THE MEIOFAUNA OF THE SWARTKOPS ESTUARY. 2. THE MEIOFAUNA: COMPOSITION, DISTRIBUTION, SEASONAL FLUCTUATION AND BIOMASS,
Port Elizabeth Univ. (South Africa). Dept. of Zoology.
A. H. Dye, and J. P. Furstenberg.
Zoologica Africana, Vol. 13, No. 1, p 19-32, 1978. 3 fig, 5 tab, 28 ref.

Descriptors: *Estuaries, *Swartkop estuary(South Africa), *Aquatic animals, *Biomass, *Distribution patterns, Fluctuations, Aquatic populations, Invertebrates, Seasonal, Biorhythms, Temperature, Oxygen, Nitrogen, Chlorophyll, Nematodes, Aquatic microorganisms, Particle size, Intertidal areas.

Analyses of faunal samples collected from two stations in the Swartkops estuary in South Africa showed population densities in a direct relationship with particle size. Although oxygen appeared to be the controlling factor, desiccation greatly influenced the intertidal distribution of meiofauna in sandy areas. Variations of temperature and oxygen were found to be responsible for the seasonal fluctuations in numbers which peaked during spring and autumn. The vertical penetration and seasonal fluctuation of the meiofauna were affected by the presence of the sand prawn, Callianassa kraussi. Because fluctuations in nitrogen and chlorophyll a had little relationship to the fluctuation of the meiofauna, it is concluded that food is not limiting in these areas. Nematodes, the dominant biomass taxon, weighed 0.42 micrograms, ash-free dry mass. The standing crop biomass determined to a depth of 20 cm was 0.40 g/sq m for sandy areas, and 0.07 g/sq m in the muddy areas. (See also W79-07348) (Davison-IPA)

MAINTENANCE OF THE NON-BREEDING POPULATIONS OF THE ESTUARINE PRAWN CALLIANASSA KRAUSSI (CRUSTACEA, ANOMURA, THALASSINIDEA),
Rhodes Univ., Grahamstown (South Africa). Dept. of Zoology and Entomology.
A. T. Forbes.
Zoologica Africana, Vol. 13, No. 1, p 33-40, 1978. 5 fig, 9 ref.

Descriptors: *Estuarine environment, *Aquatic animals, *Crustaceans, Animal populations, Life cycles, Migration, Salinity, Saline water, Resistance, Reproduction, Animal behavior, Breeding.

Callianassa kraussi Stebbing eggs were hatched in the laboratory in water with variations in salinity ranging from 5 to 35 parts/thousand to determine salinity tolerances. No eggs hatched and no first stage larvae survived in salinities below 20 parts/thousand; hatch percentage increased steadily with increasing salinity up to 35 parts/thousand. Second stage larvae were more tolerant of low salinities than first stage larvae. Of the second stage larvae in a salinity of 15 parts/thousand 80% successfully moulted to the next stage. The results of these experiments indicate that populations living in areas where salinity is permanently less than 17 parts/thousand are not self-maintaining and migrate from higher salinity areas during early post

larval stages. The species studied appears to be the only one in the genus capable of existing permanently in reduced salinities as evidenced by its presence in the Keurbooms River estuary at a salinity of 1 part/thousand. (Davison-IPA)

EPIBENTHIC ALGAL PRODUCTION IN THE SWARTKOPS ESTUARY,
Port Elizabeth Univ., (South Africa). Dept. of Zoology.
A. H. Dye.
Zoologica Africana, Vol. 13, No. 1, p 157-158, 1978. 1 tab, 7 ref.

Descriptors: *Estuaries, *Primary productivity, *Estuarine environment, *Swartkops estuary(South Africa), *Benthos, Tidal effects, Water level fluctuations, Turbidity, Seasonal, Oxygen demand, Productivity.

Benthic metabolism was measured during the spring and autumn at a sandy beach near the mouth of the Swartkops estuary (station A) and a muddy beach in the upper reaches (station B). Four tidal levels were studied at each station: high water (HW), mid water (MW), low water (LW), and under water (UW). The under water level was permanently covered by water to at least 0.30 m. Results of primary production determinations are tabulated. For station A the mean spring production was 58.5 g C/sq m/y, autumn production was 47.0 g C/sq m/y. At station B spring production averaged 123.0 g C/sq m/y, autumn production was 109.5 g C/sq m/y. The annual mean production was 53 g C/sq m/y for sandy areas and 116.5 g C/sq m/y for muddy areas. Primary production increased from HW to UW in sandy areas. The primary highest production for muddy areas occurred at LW with a large decrease towards UW because of turbidity. (Davison-IPA)

ECOLOGY OF THE AGULHAS CURRENT REGION: AN ASSESSMENT OF BIOLOGICAL RESPONSES TO ENVIRONMENTAL PARAMETERS IN THE SOUTH-WEST INDIAN OCEAN,
Natal Univ., Durban (South Africa) Oceanographic Research Inst.
A. E. F. Heydorn, N. D. Bang, A. F. Pearce, B. W. Flemming, and R. A. Carter.
Transactions of the Royal Society of South Africa, Vol. 43, Part 2, p 151-190, May 1978. 11 fig, 92 ref.

Descriptors: *Ecology, *Ecosystems, *Ocean currents, *Agulhas Current, *Indian Ocean, Sharks, Ocean circulation, Sediment transport, Sediment-water interfaces, Estuaries, Teleosts, Continental shelf, Topography, Ecological distribution, Natal.

Multi-disciplinary oceanographic research was carried out in the waters of the east coast of South Africa with emphasis on Natal. Natal coastal waters are characterized by the Agulhas Current, a very narrow continental shelf, the entry of many rivers into the sea, a series of large-scale surface water circulation patterns, and a large number of estuarine systems. The distribution and transport of sediments, basic to the occurrence of benthic fauna and ecological patterns, is closely related to the interrelationship between bottom topography and circulation patterns. Temperature induced responses, utilization of current transport mechanisms, and larval retention mechanisms and marine/estuarine interaction are given for calanoid Copepoda, Chaetognatha, spiney lobsters, marine turtles, sharks, estuarine fishes, and teleost fishes. The responses and adaptations of the animals studied provide insight into the ecological mechanisms operating in this region. It is concluded that the high flow velocities of the Agulhas Current are responsible for the massive sediment transport and distribution among the Natal coastal waters. (Davison-IPA)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 811, Price codes: A06 in paper copy, A01 in microfiche. Final Report (1979), 101 p, 15 fig, 1 tab.

Descriptors: *Desalination, *Freezing process, Secondary refrigerant method, Pilot plant, Operations.

Operational testing, maintenance and modification were conducted for nine months on a 75,000 gallon per day desalination plant. The operational parameters of a 13 foot in diameter counterwash column for this process were evaluated. Changes were made to various parts of the pilot plant to improve operations. Design deficiencies in the process and the pilot plant equipment were identified and recommendations were made to alleviate the problems. Material analysis of various aluminum components in the plant was made by Argonne National Laboratory and the results are included in this report.

DESALINATION OF SALT WATER BY SOLAR ENERGY MEANS,
FIAT S. p. A., Turin (Italy). (Assignee).
A. La Rocca.
U.S. Patent No. 4,135,985, 8 p, 6 fig, 7 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 4, p 1377, January 23, 1979.

Descriptors: *Patents, *Desalination, *Desalination processes, *Desalination apparatus, Water treatment, Water quality, Condensation, Separation techniques, Evaporation, Solar radiation, Solar distillation.

A desalination system is provided which has no moving parts, in which the heat given up on condensation of the water vapor is used for preheating the incoming salt water; and in which the intake of salt water to be desalinated is controlled by a static automatic control system. The apparatus using solar energy comprises a main insulated container with a subsidiary preheating container next to it; the main container is covered with a transparent cover serving as a selective filter to provide 'the greenhouse effect' and also as a condensation surface for water vapor. This transparent cover incorporates a hollow space, for example by making the cover double skinned. The hollow space forms part of a syphon which automatically regulates the water levels, transferring salt water from a preheating container to the main container as the level in the main container falls due to loss by evaporation leading to condensation and withdrawal of the desalinated water. The hollow part of the transparent cover thus serves also to preheat the incoming salt water with the heat lost upon condensation by the vapor within the main container. (Sinha-OEIS)

EAST MESA GEOTHERMAL TEST SITE,
Bureau of Reclamation, Boulder City, NV. Div. of Planning.
W. A. Fernelius, and M. K. Fulcher.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 105, No. EEI, p 13-32, February, 1979. 7 fig, 4 tab, 5 ref.

Descriptors: *Desalination processes, *Geothermal studies, *Desalination apparatus, Flash distillation, Electrodialysis, Evaporators, Corrosion, Scaling, Water quality, Heat transfer, Desalination plants, Design, Construction, Economic feasibility.

The results of a geothermal desalination program at East Mesa, Imperial Valley, California are described. The primary objective of this program is to provide the necessary information to permit design, construction, operation and maintenance of economical and efficient desalting systems using geothermal fluids. Three types of desalting units were tested: (1) a multistage flash (MSF) unit; a vertical tube evaporator (VTE) unit; and a high temperature electrodialysis (HTED) unit. Studies on corrosion, scale prevention, water quality, materials, and heat transfer were run concurrently with each test. All three desalting systems proved capable of desalting geothermal fluid. Problems associated with each are discussed along with possible solutions. Determination of the economic feasibility of geothermal desalting depends on other important factors such as productivity of the geothermal reservoir, compatibility of fluids, environmental concerns, and the source of replacement fluids. Data on these items are forthcoming and will provide the basis for the design and cost estimates for a production-size desalting plant. This study will include the feasibility of producing power concurrently with desalting. (Purdin-NWWA)

FINAL ENVIRONMENTAL STATEMENT: PROJECT SKYWATER, A PROGRAM IN PRECIPITATION MANAGEMENT, VOLUME I.
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 294, Price codes: A17 in paper copy, A01 in microfiche. Report No. INT FES 77-39-V-1, October 25, 1977. 363 p, 52 fig, 41 tab.

Descriptors: *Weather modification, *Cloud seeding, *Environmental effects, Cloud physics, Impact(Rainfall), Orography, Clouds, Planning, Precipitation(Atmospheric), Water, Artificial precipitation, Erosion, Runoff, Agriculture, Snow removal, Snowpacks, Ranges, Land management, Groundwater recharge, Rainfall, Rainfall-runoff relationships, Meteorology.

The programs, purpose, scope and environmental impacts of Project Skywater, a research program in cloud seeding for enhanced precipitation conducted by the Bureau of Reclamation, are presented in a final environmental statement. The research cloud seeding program is designed to remove scientific doubt and develop the required technology to make cloud seeding scientifically sound and socially acceptable as a water management tool. The research is not expected to have significantly adverse impacts, and any effect on avalanches and snow removal costs will most likely be undetectable. Application of this technology could increase high forest and alpine seasonal snowpacks up to about 15% and lengthen snow cover in areas prone to drifting by a week. Runoff in the high country would be increased about 20%, and local water quality should improve. The carrying capacity of elk ranges could be decreased in a few locations at an undetectable level. A possible 10% increase in summer convective rainfall would result in minor, local increases in humidity, runoff, and groundwater levels. Although erosion would most likely decrease on vegetated lands, range converted to cropland might become more subject to erosion. For each potential impact two numerical ratings are given: one applicable to the research program, the other applicable if the technology being devel-

oped is applied in a long-term, continuous, and widespread mode. (See W79-07490 and W79-07491) (Davison-IPA)

FINAL ENVIRONMENTAL STATEMENT: PROJECT SKYWATER, A PROGRAM IN PRECIPITATION MANAGEMENT, VOLUME II, APPENDICES A-J.
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 295, Price codes: A10 in paper copy, A01 in microfiche. Report No. INT FES 77-39-V-2, 1977. 206 p, 25 fig, 68 tab, 292 ref.

Descriptors: *Weather modification, *Hydrologic cycle, *Cloud seeding, *Artificial precipitation, Chemistry of precipitation, Rainfall, Silver iodide, Meteorology, Environmental effects, Agriculture, Economics, Ecology, Bibliographies, Sierra Cooperative Project, High Plains.

The Final Environmental Statement for Project Skywater is contained in three volumes: the major report and two appendices. Volume II consists of the detailed studies behind the report. The hydrologic cycle, a group of processes operating along the paths through which water in nature circulates, is discussed. Seeding agents are listed and discussed with regard to their application and environmental impact. The planning concepts of the Sierra Cooperative Pilot Project are examined. This project involves deliberate weather modification to increase snow accumulation feeding streams originating in the Sierra Nevada, and has been suggested as a means of augmenting California's water supply. The High Plains are described in detail with reference to hydrometeorology, ecology, agriculture, and economics. A glossary and a bibliography containing 140 listings are provided. (See also W79-07489) (Davison-IPA)

3C. Use Of Water Of Impaired Quality

WASTE WATER REUSE IN PHOENIX--HOW VIABLE IS IT,
Stevens, Thompson and Runyan, Inc., Phoenix, AZ.
J. Fulton, and W. L. Chase.
Water Resources Bulletin, Vol. 15, No. 2, p 426-435, April 1979. 2 fig, 1 tab.

Descriptors: *Water reuse, *Planning, *Water resources, *Arizona, Groundwater, Groundwater recharge, Agriculture, Irrigation, Recreation, Recreation facilities, Lakes, Fish, Cooling water, Wildlife habitats, Waste water disposal, Waste water treatment, Water conservation, *Phoenix(AZ), *Salt River(AZ).

The Phoenix metropolitan area has a unique combination of circumstances which makes it one of the prime areas in the Nation for wastewater reuse. Overriding all of these conditions is the long-term inadequacy of the existing water supplies. The Salt River Valley has a groundwater overdraft of about 700,000 acre feet per year. To help alleviate this situation, the Corps of Engineers, in conjunction with the MAG 208, is looking at ways to reuse a projected year 2020 wastewater flow of 340,000 acre feet per year. Reuse options identified included groundwater recharge, agricultural irrigation, turf irrigation, recreational lakes, fish and wildlife habitats, and industrial cooling. These look nice on paper, but before they can be implemented, some hard questions have to be answered, such as: how acceptable are local treatment plants when 15 years ago there was a major push to eliminate local plants; is the Phoenix area ready for reuse in urban areas; what are people willing to pay for water; who benefits if a city goes to groundwater recharge; how much agriculture will be left in the area by 2020. These and other questions must be resolved is reuse is to become a viable option in water resource planning in the Phoenix area. (Sims-ISWS)

EVALUATION OF CHANGES IN THE NILE WATER COMPOSITION RESULTING FROM THE ASSWAN HIGH DAM,
Alexandria Univ. (Egypt). Dept. of Soil and Water Science.
A. M. Balba.
Journal of Environmental Quality, Vol. 8, No. 2, p 153-156, April-June 1979. 4 tab, 9 ref.

Descriptors: *Rivers, *Water quality, *Nutrients, *Sediments, Salinity, Foreign research, Foreign countries, Irrigation, Suspended solids, Data collections, Potassium, Calcium, Magnesium, Nitrogen, *Egypt, *Nile River(Egypt), *Asswan High Dam, *Lake Nasser(Egypt).

The composition of Nile River water was examined to show the effect of the Asswan High Dam on the fertility and salinity of the water for irrigation. The Nile water contains about 110,000,000 metric tons/year of suspended materials as it crosses the Egyptian border. Before the Asswan High Dam was constructed, 24,000,000 metric tons/year of solids were deposited, mainly on the Egyptian floodplains. After the dam was finished, only 2,100,000 metric tons/year of solids were present in the Nile water to be deposited on the Egyptian soils; the remainder, 21,900,000 metric tons/year of solids, settled out in Lake Nasser. The loss of nutrients in the sediments which settled out in Lake Nasser and the gain in soluble cations which resulted from construction of the Dam were calculated from sediments and water analyses. The loss of 12,000 metric tons/year of sediment N is probably not significant for Egyptian agriculture. The loss of P, including a maximum of 6,000 metric tons/year of soluble P, will probably require a significant increase in the use of P fertilizers. The quality of the Nile water for irrigation, as determined by values for electrical conductivity, sodium adsorption ratio, adjusted sodium adsorption ratio, residual carbonate, and pHc, did not change significantly after construction of the dam. UNDERGROUND REFRIGERATION PRACTICE: COMPARING THE WATER SOURCES,
J. Whillier.
S. A. Mining and Engineering Journal, Vol. 89, No. 4139, p 57 and 59, April 1978. 2 tab.

Descriptors: *Water quality, *Refrigeration, *Mining, *Cooling, *Temperature control, Condensers, Coolants, Cooling towers, Cooling water, Water types, Heat transfer, Cost analysis, Cost comparisons, Operating costs.

The quality of water from three sources for use in refrigeration systems in South African gold mines is discussed. The water sources considered are: Rand Water Board (RWB) or Irrigation Department, underground fissure water, and recirculated settled mine water. The suitability of the last two types must be determined by detailed chemical analysis. RWB water, the most suitable and most costly, is cooler than water from other sources, reflecting refrigeration cost savings that would offset the purchase cost. However, supplies cannot be guaranteed at all times. Fissure water, the most suitable alternative because it can be made potable, can be treated for closed circuit condenser cooling to reduce scale formation. Its disadvantage is that it enters the mine at a temperature close to that of the surrounding virgin rock and requires additional refrigeration. According to an analysis of fissure water from a number of various zones it was determined that water from level 50 was most suitable. Cost analyses of the cooling waters, based on surface and underground cooling plants, revealed that a surface cooling tower is cheaper, easier to construct and less costly to operate than a surface refrigeration installation. Water in deep mine drains is hotter than the incoming ventilating air, and much of the heat is transferred to the air, making a clear case for pumping this water to settlers. The operating costs of using the alternatives to cool and chill fissure water under summer conditions are tabulated. (Davison-IPA)

POLLUTION OF IRRIGATION REUSE WATER BY PLANT PATHOGENS,
Department of Plant Pathology. University of Nebraska Lincoln.
J. R. Steadman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 115, Price codes: A02 in paper copy, A01 in microfiche. Nebraska Water Resources Center, University of Nebraska Project Completion Report, June 1979. 16 p, 4 fig, 2 tab. OWRT B-032-NEB(2), 14-34-0001-6096.

Descriptors: *Plant pathogens, Runoff, Water reuse, *Irrigation water.

Systematic sampling of irrigation runoff and reuse systems in Nebraska demonstrated contamination of the water with plant pathogenic fungi and bacteria. In designed reuse systems, nearly 60% of corn fields showing symptoms of Goss's bacterial wilt (Corynebacterium nebraskense) had runoff or reuse samples which were positive for the bacteria in a pathogenicity bioassay. In two instances detection of the organism in the runoff water preceded observation of disease symptoms in the field. Selective assays for many phytopathogens are not available, and attempts to find a simple indicator for waterborne plant pathogens analogous to the coliform test were unsuccessful. An assay utilizing antibiotic resistant strains of phytopathogenic bacteria was developed and enabled chlorine studies to be conducted in natural irrigation reuse water. Phytopathogenic bacteria were similar to Escherichia coli in that low levels of free chlorine were adequate for disinfection. A free chlorine residual of 0.01 to 2.0 mg/l depending on pH and contact time or a combined chlorine residual of 5 to 10 mg/l provided 99% kill. Spores of fungal pathogens, however, required 10-15 mg/l free chlorine for 5 minutes at pH 6.5 for 99% kill. Ammonia plus organic nitrogen and pH had the most significant effect of all water quality parameters tested on chlorine disinfection. Effective chlorination of reuse water may be obtained in the absence of

protected pathogens by injecting directly into the return irrigation pipe.

RECYCLING OF SEWAGE EFFLUENT BY SUGARCANE IRRIGATION: A DILUTION STUDY OCTOBER 1976 TO JUNE 1977 PHASE II-A,
Water Resources Research Center. University of Hawaii Honolulu, Hawaii.
L. S. Lau, P. C. Ekern, P. C. S. Loh, R. H. F. Young, and G. L. Dugan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 148, Price codes: A04 in paper copy, A01 in microfiche. Technical Report No. 111, August 1977. 52 p, 5 fig, 14 tab, 25 ref, 6 append.

Descriptors: *Dilution, Enteric bacteria, *Sugarcane, *Water reuse, Viruses, Hawaii, Irrigation water, Porvic samplers.

An extension of the recently completed 4-yr project, 'Recycling of Sewage Effluent by Irrigation,' Phase II-A attempts to determine the dilution necessary for an optimal balance of water disposal and sugar yield, to monitor the quantities of nitrogen leaching past the root zone, and to continue monitoring sewage effluent for the presence of human enteric viruses. The reporting period is from October 1976, when the Hawaiian cane variety 59-3775 was planted in the test plots, to June 1977. Five irrigation treatments for the 2-yr cycle with six replicates in a randomized block design were: ditch water; 12.5%; 25%; 50% effluent diluted with ditch water; and effluent the first year and ditch water the second year. Irrigation rounds of up to 10 cm were applied biweekly, and tensiometers in selected test plots monitored water stress conditions. Representative soil samples were collected and analyzed shortly after sugarcane planting. Commercial fertilizer applications of N, P, and K to the 30 test plots were completed in June 1977. Four crop logs were made on sugarcane growth in the test plots. The physical appearance of that growth was very good; however, the relatively low K-H2O index and the high total sugars from the crop log indicate a possible growth imbalance. Due to a very dry winter, rainfall during this period was nearly one-half of normal, whereas, evaporation was more than 50% above normal. The concentration of nitrogen in the soil leachates collected beneath the root zone fluctuates with fertilizer applications, but, after fertilizer applications are completed, increases with the higher percentage of effluent in the irrigation water were observed.

INDUCED RECHARGE ALONG THE LOWER COURSE OF A RIVER--SOME QUALITY ASPECTS FROM A HYDROLOGICAL POINT OF VIEW,
Rijksinstituut voor Drinkwatervoorziening, Leidschendam (Netherlands).
K. Maas.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 199-212, 1977. 7 fig, 10 ref.

Descriptors: *Water quality, *Hydrology, *Artificial recharge, *Dispersion, *Rivers, *Water supply, Groundwater, Urbanization, Equations, Hydrogeology, Lower course, Flow.

In urbanized areas the groundwater reserves are often insufficient to satisfy the great demand for water of high quality for public and industrial supply. On hydrological grounds and without relying on the purification during passage through the soil, it can be shown that induced recharge along the lower course of a river is likely to provide a cheap and reliable alternative. Available from the National Technical Information Service, Springfield, VA 22161 as AD-A053 522, Price codes: A06 in paper copy, A01 in microfiche. MS Thesis June 1977. 108 p, 4 append, 19 tab, 6 fig, 50 ref.

Descriptors: *Water conservation, *Water demand, *Domestic water, *Water resources, *Water saving devices, Non-consumptive use, Consumptive use, Waste disposal, Waste flow, Recycling, Water rates, Mesa(AZ), Urban water conservation.

The purpose of this study is to determine the constraints and misunderstandings associated with residential water conservation and to analyze the actual savings in dollars, water, and energy that are achieved by the selection and installation of water conserving facilities. Six areas having potentially valuable input to development of a residential water conservation program are: (1) cultural attitudes; (2) institutional impacts; (3) economic aspects; (4) technological alternatives; (5) public education; and (6) residential water usage patterns. These areas are analyzed with regard to their relationship to water saving measures, myths concerning water supply, pricing measures and water conservation, water demand, and other aspects of water conservation. The author investigates the selection and application of water conserving facilities in residential homes in Mesa, Arizona, located in the eastern portion of Maricopa County, 16 miles east of Phoenix. The analysis begins with a brief summary on the growth of Mesa and a discussion of current household water usage and fixture consumption. A review of the water saving devices and appliances to reduce consumption is presented. An acceptable list of water using devices and appliances is developed for consideration in both existing and new homes and each is evaluated for residential unit water savings and costs. Conclusions indicate that residential water conservation would relieve volume loading on sewage facilities and reduce energy demand. Total water savings and costs were also formulated. An appendix lists reasons for reducing water consumption, and another presents a summary of water conserving facilities. (Coan-NC)

WATER USE OF POTATOES IN THE TEXAS ROLLING PLAINS,
Texas Agricultural Experiment Station, College Station.
D. G. Bordovsky, C. J. Gerard, and B. D. Kingston.
Report No. PR-3435 C, March 1977. 14 p, 3 tab, 6 fig, 3 ref.

Descriptors: *Consumptive use, *Vegetable crops, *Water utilization, *Crop response, *Irrigation effects, Efficiencies, Moisture uptake, Irrigation practices, Irrigation systems, Sprinkler irrigation, Furrow irrigation, Soil compaction, Soil profiles, Soil water potential, Soil moisture, Dry farming, Texas, Water management(Applied).

Water requirements of potatoes, a crop of economic importance grown on the Texas Rolling Plains, has become of interest as pumping costs from the region's shallow wells has risen. To accumulate data on the water requirements of potatoes, when it should be applied, and how to apply it most effectively, an irrigation study was initiated at the Texas A and M Vegetable Research Station at Munday which analyzed six irrigation schedules and a dryland treatment on Miles fine sandy loam soil. Soil moisture was monitored on all treatments with tensiometers and a neutron probe to a depth of 5 feet throughout the growing season of the Red La Sota variety tested, and plant growth measurements were taken. Crop yield was found to be a linear function of applied irrigation water; and water use accumulated linearly during irrigation when the soil water potential was at .15 atmospheres, indicating a uniform demand curve during this portion of the growing season. Although no statistically different water use efficiencies were found, trends indicated that water use efficiencies were lower on the furrow irrigated plots than on the sprinkled plots irrigated at the same depletion percentage. Soil sampling indicated a relatively compacted sandy layer was restricting root development to the top foot of the soil profile, and profile modification by deep chiseling or plowing is suggested to increase the reservoir from which the crops can draw water. Dryland treatment had a significantly lower yield than all irrigated treatments. (Tickes-Arizona)

PLANT PHYSIOLOGICAL RESPONSES TO WATER STRESS,
Nebraska Univ., Lincoln. Dept. of Horticulture.
C. Y. Sullivan, and J. D. Eastin.
Agricultural Meteorology, Vol. 14, p 113-127, 1974. 2 fig, 6 tab, 63 ref. OWRT-A-026-NEB(2).

Descriptors: *Plant physiology, *Drought resistance, *Moisture stress, *Crop response, Plant growth, Proteins, Root systems, Stomata, Water balance, Photosynthesis, Moisture content, Moisture uptake, Water requirements, Equilibrium.

Water use efficiency of plants grown under drought conditions, physiological responses to water stress, and factors contributing to conventional drought resistance are discussed. Experimental work with two sorghum hybrids showed the existence of genotype differences in response to water stress and critical water potentials. Dehydration, or desiccation tolerance, is the equilibrium relative humidity, or water potential, causing 50% killing of the cells. Differences were also found in the ability of different species and varieties to harden in response to drought exposure. A natural hardening period, or previous exposure to water stress conditions, significantly influenced measured responses, such as photosynthesis and stomatal movement. The growth stage at which the stress occurs also influences the response. From the results of drought and heat tolerance tests it is con-

cluded that genetically controlled tolerance factors can be selected for and used in plant breeding programs. (Davison-IPA)

ORCHARD IRRIGATION SCHEDULING: RESULTS OF A PRELIMINARY INVESTIGATION,
Elgin Co-operative Fruit Growers, Ltd. (South Africa).
A. Fochessati.
The Deciduous Fruit Grower, Vol. 28, part 8, p 290-299, August 1978. 6 fig, 1 tab.

Descriptors: *Irrigation, *Irrigation design, *Irrigation efficiency, *Water management(Applied), *Irrigation programs, Orchards, Surface irrigation, Water utilization, Consumptive use, Crop production, Moisture uptake, Optimum development plans, Orchards, Southern Africa.

To estimate the rate and frequency of irrigation for any application during the growing season the influence of the following factors must be assessed with regard to the time of the season: (1) climate including temperature, wind, and humidity; (2) type of ground cover in the orchard; (3) total leaf area of both the trees and the cover crop; (4) water retention capacity of the soil in the root zone; (5) irrigation method and the relative efficiency of water utilization; and (6) orchard aspect. An investigation being conducted in an apple orchard is described in which evaporation data obtained from an evaporimeter is used. In assessing the values of a rainfall and an equivalent volume of water applied by microjets the quantity of water consumed by the trees at various stages during the season must be considered. The difference between consumptive requirements of the tree and actual water consumed to satisfy this requirement can be attributed to the method of application. In orchards where strip irrigation is employed the area watered is restricted to less than half the total ground surface. Where irrigation application is over the entire surface, evapotranspiratory losses are increased by the water consumption of the sod grown in the alleyways and evaporation from the larger surface area which includes the sod leaf surface area and the soil immediately below the surface. When a pattern of irrigation requirement has been developed and the 'crop factor' worked out evaporation records can be used to determine irrigation scheduling according to seasonal needs. (Davison-IPA)

Descriptors: *Economic analysis, Profitability, Investment analysis, *Irrigation, Linear programming, Simulation, Texas.

A modified MOTAD linear programming-simulation model was developed to generate estimates of survival and profitability by recursive simulation of multiple time periods, as follows: (1) development of a farm plan, (2) generation of stochastic prices and yields, (3) simulation and evaluation of the farm plan in operation, and (4) update of the planning situation to reflect adjustments in expected prices, expected yields, and credit restrictions. The model then returns to step 1 for simulation of the next time period. The model was applied to the Coyanosa and St. Lawrence regions under alternative future scenarios for inflation rates, energy prices, crop prices and interest rates. The Coyanosa farm survived about 8 years under the optimistic scenario and 5 years under all other scenarios. The most likely rate of survival was 20-30 percent with a range of 10 percent to 65 percent for other scenarios. The average life and rate of survival was higher for the St. Lawrence farm under all scenarios. It was concluded that (1) survival and profitability of irrigated crop production in the Coyanosa area will depend greatly upon future levels of inflation, energy prices, crop prices, and interest rates, (2) survival and profitability for Coyanosa will most likely be lower than St. Lawrence, and (3) land purchase provides greater potential survival and profitability than traditional crop share rental arrangements.

SPEED CONTROL MEANS FOR CENTER PIVOT IRRIGATION SYSTEM,
Toro Co., San Marcos, CA. (Assignee).
E. J. Hunter, R. E. Hunter, and R. W. Cudworth.
U.S. Patent No. 4,135,539, 13 p, 13 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 978, no 4, p 1228, January 23, 1979.

Descriptors: *Patents, *Irrigation, *Irrigation systems, Irrigation practices, Irrigation efficiency, Hydraulic systems, Hydraulic equipment.

A method and apparatus for operating a center pivot irrigation system includes span units, each having a drive carriage having a hydraulically driven motor. Hydraulic fluid is supplied at a selectable value of constant volume fluid flow to the system to drive the system at a selectable average speed about its center pivot. The flow rate of fluid to individual motors of individual span units which are ahead or behind a predetermined relative alignment with the other span units is varied in response to changes in angularity sensed between adjacent span units in both forward and backward directions relative to the direction of travel of the system about its center pivot while the constant volume fluid flow through the system is being maintained at a selectable constant flow rate. An improved hydraulic adjustable rate flow valve accommodates fluid flow in reversible directions while maintaining close control or metering capabilities over the fluid flow through the valve in either flow direction. U.S. Patent No. 4,135,668, 5 p, 10 fig, 12 ref; Official Gazette of the United States Patent Office, Vol. 978, no 4, p 1271, January 23, 1979.

Descriptors: *Patents, *Irrigation, *Irrigation practices, *Irrigation efficiency, Application equipment, Soaker hose.

A support assembly for a flat soaker hose is comprised of a spike insertable into the ground with mounting provisions at the top end for a clamp assembly which can be placed at various angular positions. The clamp assembly has a number of cantilevered fingers placed in staggered opposing alignment which provide clearance equal to the nominal dimension of a hose when unpressurized. The clamp is insertable at various angular dispositions into the upper end of the spike or it may be attached to a ball swival mount and the upper end of the spike of provided with a split ball seat drawn tight by a wing nut arrangement. The edges of a flat soaker hose are grasped by the clamp and subsequent pressurization of the hose increases the securing interlock. (Sinha-OEIS)

WATER ACTIVATED STOP FOR SPINNERS,
H. S. Ausherman.
U.S. Patent No. 4,136,826, 5 p, 3 fig, 2 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 5, p 1665, January 30, 1979.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Application equipment, Irrigation efficiency, Irrigation practices, Water conveyance, Irrigation spinners.

Spinners mounted on the main water distribution pipe of a center pivot irrigation system are free to continue to rotate when the water pressure to the spinners is turned off. Also, the spinners are free to rotate when contacted by the wind. The continued rotation of the spinners, which are connected to a vertical spinner drive shaft which is used for driving rubber tired drive wheels, allows continued movement of the irrigation system causing the equipment to travel in an irregular path. This invention describes a water activated stop device which is connected to the water in the main water distribution pipe and is held in a disengaged position when water pressure is applied. When water pressure is turned off a stop arm attached to a pivot arm engages a spinner rod attached to the rotating spinner shaft and prevents continued rotation of the spinners. (Sinha-OEIS)

RESIDUAL NITRATE-N IN FINE SAND AS INFLUENCED BY N FERTILIZER AND WATER MANAGEMENT PRACTICES,
Science and Education Administration, Akron, CO.
D. E. Smika, and D. G. Watts.
Soil Science Society of America Journal, Vol. 42, No. 6, p 923-926, November-December, 1978. 5 fig, 1 tab, 6 ref.

Descriptors: Nitrogen, *Nitrates, *Nitrification, Application methods, *Irrigation systems, Groundwater, Return flow, Corn.

On fine sandy soils fertilizer N and water management are the key to controlling NO3(-)N movement below the root zone of an irrigated corn crop. When the N was applied in one broadcast application at seeding, very little NO3(-)N remained in the soil at the end of the growing season, regardless of the amount of growing season water application. Overwinter leaching of NO3(-)N below the 150-cm sampling depth was minimal with 13 cm of precipitation received during these months. When N was applied through the solid set sprinkler irrigation system during the growing season before tasseling, water application rate and total N applied determined the amount of NO3(-)N that remained in the soil at the end of the growing season. During the overwinter period, NO3(-)N actually increased in the soil due to nitrification of some of the NH4(+)-N. With proper N application and water management, the potential for NO3(-)N leaching below the crops' root zone can be greatly reduced. (Skogerboe-Colorado State)

FINITE ELEMENT ANALYSIS OF THREE-DIMENSIONAL WIND-DRIVEN FREE SURFACE FLOWS,
Utah State Univ., Logan. Dept. of Civil and Environmental Engineering.
C. T. Kincaid.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 726, Price codes: A12 in paper copy, A01 in microfiche. Doctoral Dissertation, 1979. 265 p, 20 fig, 20 tab, 6 append. OWRT B-139-UTAH(4). 14-34-0001-7191.

Descriptors: *Finite element analysis, Wind tides, Fluid flow, Fluid mechanics, Viscous flow, Shear, Surface waters, Great Salt Lake, Navier-Stokes equation, Poisson's equation.

The purpose was to develop a numerical model of three-dimensional, viscous, incompressible flows with a free surface. Driving forces included wind-induced shear, free surface set-up, bottom shear, and Coriolis. An uncoupled solution of the Navier-Stokes equations for velocity and a Poisson's equation for pressure was presented. The assumption of hydrostatic pressure reduced the pressure variable to one of free surface elevation. The analysis was performed with two and three-dimensional elements characterized by their multiple degree of freedom nodes and cubic interpolation on element edges. A new free surface element was developed which employs C1 interpolation of the free surface and C0 interpolation for the problem interior. This hybrid Bogner-Adini element was coupled with a Bogner element model of the free surface and an Adini element model of the interior fluid domain. Sparcely discretized cube and shallow rectangular cavities were used to test the model's similative ability. These hypothetical problems were necessary due to the relatively poor cost effective character of the numerical analysis. Vertical recirculation was shown for the cube cavity, while horizontal recirculation was suggested by the shallow cavity solutions. Stability of computation was related to eddy viscosity and characteristic length via an elemental Reynolds number. Further refinement and application of the model to actual lakes was left to future research.

ON THE DISSOLVED SOLIDS OF THE PONGOLO FLOOD PLAIN PANS,
Natal University, Pietermaritzburg (South Africa).
J. Heeg, C. M. Breen, P. M. Colvin, H. D. Furness, and C. F. Musil.
Journal of the Limnological Society of Southern Africa, Vol. 4, No. 1, p 59-64, July 1978. 8 fig, 1 tab, 13 ref.

Descriptors: *Flood plains, *Pongolo River(South Africa), *Water analysis, *Dissolved solids, *Anions, *Flooding, Environmental effects, Solutes, Soils, Seepage, Seepage water, Irrigation water.

Data are presented from a comprehensive survey conducted after the impounding of all flood water in the Pongolopoort dam in 1970 and an ensuing prolonged dry winter, and routine monitering conducted when the impounded water was periodically released during the summer months of 1975 and 1976. Determination of major cation concentrations was made from water samples collected from selected pans on the flood plain. The water in the Pongolo flood plain pans contains higher total dissolved solids than the Pongolo River, and the composition of the solutes approximates seawater in equivalent ionic proportions at high concentrations. These solutes originate from highly mineralized seepage water characteristic of soils overlying Cretaceous sediments of marine origin. This precludes the use of irrigation seepage water to maintain the water levels in the pans. Therefore, to maintain the present biological characteristics of the pans, the system must be flushed by the release of simulated floods from Pongolopoort Dam. (Davison-IPA)

STORM WATER MANAGEMENT FOR NEPEAN, MERIVALE AREA,
Gore and Storrie Ltd., Toronto (Ontario).
Canada-Ontario Agreement on Great Lakes Water Quality, Environmental Protection Service, Environment Canada, Ottawa, Canada; Ontario Ministry of the Environment, Toronto, Ontario, Canada, Research Report No. 89, 71 p, 18 fig, 10 tab. 74-8-10.

Descriptors: *Storm water, *Storm runoff, *Water management(Applied), Storm drains, Rainfall-runoff relationships, Pollutants, *Rideau River, Storage, Treatment overflow, Model(STORM), Storm Water Managemet Model(SWMM).

A detailed analysis of the quantity and quality of storm runoff from the Merivale area of Nepean, Ontario, to the Rideau River was carried out. The Merivale area watershed comprised 1300 acres of industrial (705 acres), residential (135 acres) and open land (460 acres). An open ditch storm drainage system collects and transports runoff from the originally developed areas to Nepean Creek, and ultimately to the Rideau River. The newly developing area of Merivale Acres Industrial Colony is serviced by storm sewers which drain to a 120 inch diameter main trunk sewer routed through the development area. A main trunk and local sewer system plan has been developed to service the entire area. The Rideau River has been identified by the Ontario Ministry of Environment as a particularly sensitive watercourse with a limited ability to assimilate polluting discharges. The Storage, Treatment Overflow Runoff Model (STORM), developed by the U.S. Army Corps of Engineers, was used in this analysis for continuous simulation of rainfall and runoff based on hourly precipitation data. The Storm Water Management Model (SWMM), as developed by the U.S. Environmental Protection Agency, was used to simulate specific storm events. These models generated quantity and quality information for storm runoff from the area. Based on this information, three storm water management control and treatment alternatives were prepared. Estimated costs for the proposed control and treatment alternatives are provided. (WATDOC)

WATER, WATER: EDITORIAL COMMENT,
Citrus and Subtropical Fruit Journal, No. 535, p 1 and 14, June 1978.

Descriptors: *Water resources development, *Planning, *Project planning, *Water reuse, *South Africa, Water requirements, Consumptive use, Industrial water, Agriculture, Water demand, Water storage, Resources development, Effluents, Waste water treatment.

A South African Commission of Enquiry into Water Matters found that 40% of the country's water resources was being used in 1970, and 100% of the current available resources would be used up by the turn of the century. Existing water storage capacity and storage capacity under construction in 1970 was 9.3 morgen ft (a morgen ft is equal to 576,250 gals). It is expected that by the year 2000 the Orange River Project will have increased storage capacity to 30 million morgen ft. The major economic regions of the country will require an estimated total of 2,934 million gals/day by then. During 1977 the Water Research Commission financed water research projects involving the CSIR, industries, government departments, local authorities, universities, and a provincial authority under the principle of partnership research in which potential users of research results are involved in the planning and execution of the projects. This represents a savings on direct research expenditure in addition to promoting tech-

nology transfer. Production costs of reclaimed water at the Stander Water Reclamation Plant, Daspoort, Pretoria, were 20% less than a year ago. Research at this plant is directed towards the development of design and operational criteria for the fullscale application of water reclamation in South Africa. (Davison-IPA)

SUBURBAN DRAINAGE,
Ohio Legislative Service Commission, Columbus.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 267, Price codes: A05 in paper copy, A01 in microfiche. Staff Research Report No. 124, 1977. 74 p, 1 append.

Descriptors: *Storm runoff, *Drainage, *Urban drainage, *Municipalities, *Ohio, *County Ditch Law, Urban areas, Urban runoff, Surface drainage, Drainage effects, Storm drains, Public projects, Sewer districts, Sanitary districts, Financing, Zoning, Fees, Taxes, Assessments.

This report deals with suburban drainage problems and methods of initiating and financing needed drainage improvements in suburban areas. It focuses on drainage problems in Ohio's suburbs, existing Ohio laws and practices concerning these problems, and proposals to deal more effectively with suburban drainage. The distinctive characteristics of suburban drainage, actual drainage problems in Ohio suburbs, and possible means of preventing future drainage problems are presented with a discussion on how adequate planning can prevent these problems. Possible legislative actions to rectify drainage problems include requiring subdivisions to enact zoning ordinances, drainage regulations, or subdivision regulations that govern water runoff. Planning commissions could be permitted to charge developer fees to pay for regulation of the additional water runoff the development will cause. The report also discusses Ohio Court decisions on suburban drainage, and difficulties landowners encounter in resolving suburban drainage disputes through the courts. The statute specifying county drainage powers, the County Ditch Law, is described and evaluated along with township drainage powers. Ohio courts have not formulated a prevailing rule governing suburban drainage disputes. Generally, a landowner may recover damages if these damages result from artificial drainage rather than from natural watercourse drainage. The report differentiates between incorporated and unincorporated suburban areas and discusses their particular problems and remedies. (Coan-NC)

PROCEEDINGS, NORTH CAROLINA WORKSHOP ON MANAGEMENT OF STORMWATER, SEDIMENTATION AND FLOOD CONTROL IN URBAN AREAS,
North Carolina State Univ. at Raleigh. Water Resources Research Inst.
n.d., 55 p.

Descriptors: *Stormwater management, *Sedimentation, *Flood control, Erosion, Urban drainage, Urban runoff, North Carolina, Local government, Legislation, Ordinances, Regulatory practices.

The North Carolina Workshop on Management of Stormwater, Sedimentation and Flood Control in Urban Areas was held January 5, 1978, in Apex, North Carolina. The objectives of the workshop were: (1) to develop an overview document on appropriate unified local and state control strategies for stormwater quality, sedimentation and erosion, urban drainage, and flood control; (2) to assess needs for research projects for new investigations leading to possible new legislation; and (3) to provide a mechanism for experience-sharing and coordination between persons working in the subject fields. The workshop was devoted entirely to questions of administration and management, legislation, ordinances, and regulatory practices. It consisted of prepared presentations and directed discussions. The morning session included presentations by state and local officials, and the afternoon session consisted of a workshop where a summary policy paper was developed. These proceedings contain the papers presented and the workshop results, as well as the lists of task force members and attendees. Although not all material which was available at the workshop is contained in these proceedings, it is intended to provide a resource document for state and local governments in developing improved management procedures for these program areas. THE EFFECTS OF AN URBAN AREA ON THE WATER MANAGEMENT OF A RURAL AREA,
Cultuurtechnische Dienst, Utrecht (Netherlands).
H. M. A. Kempen, and H. Ton.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 59-62, 1977.

Descriptors: *Effects, *Water management(Applied), *Drainage systems, *Rural areas, Urban areas, Rainfall, Floods, Channels, Water level, Groundwater, Wooden piles, Building foundations.

The discharge in a rural drainage system resulting from rainfall in built-up areas has been simulated by models of nonstationary flow. The results show that when floods are likely to occur in an existing system, the widening of the drainage channel along a few hundred metres is all that is required. This solution is much less drastic and cheaper than the construction of storage ponds. The foundations of many buildings are on wooden piles, and it is essential that these piles stay below groundwater level. In projects for rural development the water table is often lowered putting the foundations of existing buildings at risk. It is possible to remedy this by local injections of water to maintain the water level at the foundations. If the buildings are sufficiently far from the drainage channels additional measures are not necessary. (See also W79-07426) (Bell Graf-Cornell)

A. B. Avakyan, V. P. Saltankin, and V. A. Sharapov.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 226-230, 1977.

Descriptors: *Urban hydrology, *Water resources development, *Moscow(USSR), Water supply, Water conservation, Reservoirs, Irrigation, Water pollution control, Environmental protection, Water quality, Water demand.

Developing society imposes heavy demands on the amount and quality of water used in urban areas. The important aspects of this problem are water supply for domestic and industrial uses, replenishment of water resources, irrigation, recreation, pollution control of water bodies and environmental protection in water-land complexes. These are discussed as applied to the built-up area of Moscow. (See also W79-07426) (Bell Graf-Cornell)

ENVIRONMENTAL IMPLICATIONS OF SERVICE RESERVOIRS,
H. Bandler.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 231-237, 1977.

Descriptors: *Service reservoirs, *Environmental effects, *Sydney(Australia), Safety, Recreation, Aesthetics, Water distribution(Applied), Underground, Characteristics, Roof area.

Use of service reservoirs goes back to antiquity. Size, shape, location and building materials vary. Safety of construction is important for the community. Environmental aspects of water distribution reservoirs in Sydney differ. The least environmental impact is from underground reservoirs, but the roof area should be available for recreation. Most are built above ground for economic reasons; they can be enhanced environmentally by architectural treatment, painting and landscaping. Creative efforts have to be made to fulfill aesthetic requirements. (See also W79-07426) (Bell Graf-Cornell)

4B. Groundwater Management

PONDING-TEST PROCEDURE FOR ASSESSING THE INFILTRATION CAPACITY OF STORM-WATER BASINS, NASSAU COUNTY, NEW YORK,
Geological Survey, Syosset, NY. Water Resources Div.
R. C. Prill, and D. A. Aronson.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $1.50. Geological Survey Water-Supply Paper 2049, 1978. 29 p, 13 fig, 4 tab, 11 ref.

Descriptors: *Groundwater recharge, *Artificial recharge, *Testing procedures, *Ponding, *Infiltration rates, Unsaturated flow, Hydrogeology, Aquifer characteristics, Storm runoff, Hydraulic conductivity, Planning, Evaluation, Aquifer management, *Long Island(NY).

A procedure to obtain field data for assessing performance of storm-water basins having high infiltration rates is described. The basin selected was divided into test plots, and treated municipal water from a fire hydrant was ponded to the desired depth so that infiltration rates and flow patterns in the unsaturated zone could be determined by standard methods. The study was made at a storm-water basin excavated in glacial outwash deposits in Nassau County, Long Island, N.Y. in 1971-72. The types of interpretations and evaluations that can be made from test data are described, and applications of the procedure as well as guidelines for developing a similar testing program are given. Observations of special significance were: (1) Infiltration rate of the basin at low water stage is about 1.5 feet per hour but increases with increased water level; (2) flow through the unsaturated zone is essentially vertical; (3) infiltration rate is controlled by a surface stratum--in this case a gravelly, sandy loam; and (4) the position of the water table has little effect on infiltration rate provided it is below the lower boundary of the controlling zone. These observations can be used in evaluating a storm-water basin's suitability for supplemental recharge with treated wastewater, in comparing procedures for increasing a basin's infiltration capacity, or in the design of new storm-water basin systems. GROUNDWATER WITHDRAWAL AND WATER CONTROL IN THE NETHERLANDS. HOW TO INCREASE THE POSSIBILITIES OF EXPLOITING GROUNDWATER BY ADEQUATE WATER MANAGEMENT,
Cultuurtechnische Dienst, Utrecht (Netherlands).
H. G. Broeze, and T. Couwenhoven.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 179-187, 1977. 1 fig, 4 tab, 5 ref.

Descriptors: *Groundwater, *Withdrawal, *Water management(Applied), *The Netherlands, Drainage, Agricultural, Groundwater extraction, Geohydrology, Deep wells, Pumping, Surface waters, Drawdown, Water supply, Soils.

In the Netherlands, the growth in the population in combination with an increasing degree of industrialization over the last few decades has led to a rapid increase in the extraction of groundwater for domestic and industrial supplies. As a result of the hydrogeological conditions, most of the groundwater extraction causes a drawdown of the groundwater table. This can influence agricultural production and the natural environment, because in most of the Netherlands, the groundwater table is found within 1 or 2 m of the soil surface, and thus the capillary fringe reaches the root zone. Also, the discharge of brooks and rivers can be reduced by groundwater extraction. These effects can be only partly compensated for by the supply and conservation of surface water. Consequently, the issue of licenses for groundwater extraction is at present limited. The use of surface water for the production of drinking water is still a very expensive alternative, compared with the use of groundwater. Therefore, the relationship between groundwater and surface water has been studied in order to find ways to optimally manage the hydrological system. In agricultural and municipal areas, measures are taken to prevent damage caused by excess water in rainy periods. It is plausible that these measures can partly remain in obeyance when the groundwater level is lowered by groundwater extraction. Further, the existing system of ditches in agricultural areas can be used for agricultural water supply as well as to replenish the groundwater. In both cases, a synthesis between the objectives of the interested parties is pursued on behalf of optimal water management. (See also W79-07426) (Bell Graf-Cornell)

H. Bouwer.
Journal of the Urban Planning and Development Division, Proceedings of the American Society of Civil Engineers, Vol. 105, No. UP1, p 41-49, January 1979. 5 fig, 16 ref.

Descriptors: *Irrigated land, *Valleys, *Urbanization, *Arid lands, Water utilization, Water reuse, Optimum development plans, Flooding, Sewage effluents, Storm runoff, Ground water recharge, Water management(Applied), Salt balance, Water levels, Deep percolation.

Irrigated valleys of the southwestern United States and other arid lands are prime areas for urbanization through expansion of existing towns in these valleys since it is easier to build on flat land where water and roads are already available. Irrigated valleys frequently have limited water supplies with most of the available water being used for irrigation. Urbanization in the valleys results in loss of irrigated land, increased flooding and reduced opportunities for reuse of sewage effluent. These disadvantages can be avoided if urbanization were to take place on the nonirrigated higher lands (deserts, foothills, etc.). Storm runoff from these lands would be spread over the lower agricultural land for irrigation and ground water recharge. Ground water management of an irrigated valley must achieve a salt balance for the entire valley to assure permanent irrigation. Where ground water levels are low, they can be brought up by a reduction in irrigation or by additional ground water recharge. Once ground water levels are sufficiently high, a program of balanced withdrawal and replenishment of ground water can be instituted to avoid long-term ground water declines. (Purdin-NWWA)

WOOD DRIVING OPERATIONS IN SWEDEN AND FINLAND.
Environmental Protection Service, Ottawa (Ontario). Water Pollution Control Directorate.
Economic and Technical Review Report EPS 3-WP-78-6, 1978. 73 p, 43 fig, 3 append.

Descriptors: *Pulp and paper industry, *Lumbering, *Transportation, Water conveyance, Legislation, Environmental effects, Fish, Sewage lagoons, *Sweden, *Finland, Lake Saimaa, Kemi River.

Report of a visit by a group of Federal Government/Industry representatives, August 16 - September 1, 1976. In August, 1976, a group of four Canadians representing the Federal Department of the Environment, and the Canadian pulp and paper industry visited Sweden and Finland to observe wood driving operations. This report describes information obtained on methods of transporting wood, legislation regarding water transport of wood, volumes driven, and environmental and other problems encountered in transporting wood by water in these countries. Wood driving companies and sites were visited and are also described. (WATDOC)

ASSESSING MAN'S IMPACT ON WETLANDS,
Military Academy, West Point, NY.
G. E. Galloway, Jr.
University of North Carolina Water Resources Research Institute, Raleigh Report No. 136, December 1978. 115 p, 49 fig, 3 tab, 68 ref, 3 append. Also as Sea Grant Publication UNC-78-17.

Descriptors: *Wetlands, *Environmental effects.

The report summarizes an approach to properly define the relative impacts of proposed projects on wetlands. It provides a short background on federal interest in wetlands and a discussion of how, when, and where man's impact on wetlands occurs. The next section focuses on impact assessment, first by defining the characteristics of a usable evaluation system and then by briefly surveying current evaluation techniques. The third section proposes the Wetland Evaluation System (WES). The fourth section applies this model, for illustrative purposes, to abbreviated case studies of wetland evaluation in the Yazoo Basin of Mississippi and the Neuse River Estuary of North Carolina. Comments are included on the utility of the WES and the concepts contained within the WES. (Kiger-North Carolina)

EFFECTS OF URBANIZATION ON THE DISTRIBUTION OF FRESH AND SALINE GROUNDWATER IN THE NETHERLANDS,
Technische Hogeschool, Delft (Netherlands).
J. C. van Dam, and W. H. C. ten Hoorn.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977, IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 488-499, 1977. 8 fig, 3 ref.

Descriptors: *Effects, *Urbanization, *Freshwater, *Saline water, *Groundwater, *Netherlands, Water level, Flow, Chlorine, Equations, Hydrology, Aquifers, Saline water-freshwater interfaces, Recharge, Subsoil, Rhine River basin, Holocene formations, Semipermeable layers, Geological history.

About 25 percent of the Netherlands is below mean sea level, and this is also the case with the greater part of the densely urbanized western part of the country. Owing to the geological history, saline water is found in the subsoil, and in some deeper polders saline seepage reaches the surface water. New town developments are often realized in polders, in which case, in order to obtain good drainage, either the surface must be raised, or the polder level lowered. The last solution is, as a rule, the cheapest, but lowering the polder level means a rise of the interface between the fresh and saline groundwater and consequently a greater chance of saline seepage. A good insight into the present occurrence of saline groundwater is necessary, together with the ability to predict the consequences of changes in the level of groundwater and/or surface water. For a one-dimensional, steady case a calculation is given, whereas for the more complicated cases the means of achieving a solution are given. (See also W79-07426) (Bell Graf-Cornell)

EFFECTS OF URBANIZATION ON WATER MANAGEMENT IN THE WESTERN PART OF THE NETHERLANDS,
Technische Hogeschool, Delft (Netherlands).
H. Hengeveld, J. van der Kley, and J. Luijendijk.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 500-513, 1977. 6 fig, 6 tab, 5 ref.

Descriptors: *Effects, *Urbanization, *Water management(Applied), *Netherlands, Drainage, Planning, Governments, Pumping, Natural discharge, Paved surfaces, Water systems, Urban areas, Rural areas.

Described are the quantitative effects of urbanization on water management in the western part of the Netherlands during the last hundred years. Particularly, the increase of paved surfaces is investigated. Moreover, the development of the water management system and more specifically the ways in which urban areas are related to the whole system are studied. A number of specific drainage methods is discussed. The effects of urbanization on the water systems in urban areas, on the water systems in the adjacent rural areas, and on the catch water basin are indicated. This analysis and the analysis of the urbanization plans of the Netherlands Government are used to draw conclusions regarding the effects of future urbanization on the water management system. THE WATER SUPPLY OF MARRAKESH: SHORT, MEDIUM AND LONG TERM SCHEMES. INFLUENCES ON THE WATER TABLE, (IN FRENCH),
Ministere des Travaux Publics et des Communications, Rabat (Morocco). Direction de l'Hydraulique.
A. Kabbaj, I. Zeryouhi, and Th. Pointet.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 514-519, 1977. 1 fig, 1 tab.

Descriptors: *Water supply, *Effects, *Water table, *Marrakesh(Morocco), Forecasting, Optimum development plans, Surface waters, Groundwater, Water utilization, Water requirements, Irrigation water, Infiltration, Diversion.

Tourist developments in the city of Marrakesh, Morocco, are causing an overall growth and a particularly rapid increase in the needs for water. The forecast of these needs and their solutions will be integrated from 1981 onwards in a group scheme for the exploitation of the Haouz plain. This scheme foresees the optimal utilization of the surface and groundwater resources of the basins. It will utilize an important water supply that will be diverted from the neighboring basin of Tassaout. A temporary over-exploitation of the water table will be called for and the effects of this have been researched. From 1981, the reestablishment of the piezometric level will be ensured by the infiltration of excess water from irrigation. (See also W79-07426) (Bell Graf-Cornell)

WATER SUPPLY AS A LIMITING FACTOR IN DEVELOPING COMMUNITIES: LOCAL VERSUS REGIONAL SOURCES,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Geography.
R. M. Hordon.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 520-525, 1977. 1 fig, 1 tab, 17 ref.

Descriptors: *Water supply, *Urban development, *Local sources, *Regional sources, *New Jersey, Population growth, Planning, Groundwater, Aquifers, Recharge, Governments, Baseflow diminishment, Yield decrementing, Atlantic coastal plain(NJ), Land development capacity.

A growing number of developing communities in New Jersey are planning for an ultimate population that would be supplied only by local sources of water. At the state and national level, however, reliance on regional sources appears to be in favor. Both viewpoints recognize that water supply is a major critical factor in determining the capacity of a land area to support a population. Three planning issues that bear in this local-regional source controversy are discussed: (1) deep confined aquifers which have recharge areas in other political jurisdictions and are therefore regulated by other governing bodies will not count as a local source, i.e., reliance will be placed only on shallow water table aquifers which are recharged by local precipitation; (2) total development of the groundwater resources of a headwaters community could result in severe base-flow diminishment, thereby supporting the notion that these communities have a regional responsibility to restrict their growth so as to preserve and protect the water supply for downstream users; and (3) yield decrementing estimates, i.e., how much recharge water is lost to runoff as a consequence of development, are needed in order to assess the magnitude of local water resources. THE RELATIONS BETWEEN WATER MANAGEMENT AND PHYSICAL PLANNING IN POLAND FOR URBANIZED AREAS,
Research Inst. on Environmental Development, Warsaw (Poland).
P. Blaszczyk, and A. Nowakowska-Blaszczyk.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 550-557, 1977. 2 fig, 7 ref.

Descriptors: *Effects, *Urbanization, *Water management(Applied), *Planning, *Poland, Water supply, Decision making, Capital, Investment, Floods, Effluent discharge, Municipal wastes.

Presented are the kinds of physical development plans carried out in Poland and the scope of studies on the systems of water supply and effluent discharge from cities, carried out within the different types of plans. Shown is the significant influence of water economy, including water supply and effluent discharge, upon the formation and development of the settlement network and cities, and indicated are the forms of this influence in urbanized areas. The selection criteria for the most suitable plan alternatives and the influence of the solutions of water supply and effluent discharge systems, together with the effects of floods caused by land urbanization, upon decision making are discussed. The particular importance of water supply and effluent discharge in urbanized areas within the systems of water management and urban technical infrastructure is emphasized from the viewpoint of capital investment designated for water economy (investment outlays for water supply and effluent discharge from cities will comprise 60 per cent of the outlays for each of the above-mentioned systems). 4D. Watershed Protection

INTENSIVE SITE PREPARATION AND SEDIMENT LOSSES ON STEEP WATERSHEDS IN THE GULF COASTAL PLAIN,
Arkansas Univ. at Monticello. Dept. of Forestry
R. S. Beasley.
Soil Science Society of America Journal, Vol. 43, No. 2, p 412-417, March-April 1979. 2 fig, 4 tab, ref.

Descriptors: *Small watersheds, *Erosion, *On-site investigations, *Mississippi, *Gulf coastal plain, Forest watersheds, Watersheds(Basins), Watershed management, Hydrology, Sedimentation, Runoff, Loblolly pine trees, Pollutants, Sediments, On-site data collections, Channel erosion, Scour, Methodology, Streamflow, Rainfall, Land management, Sediment yield, Runoff, Erosion control, Nonpoint source pollution.

The hydrologic effects of 3 methods of intensive site preparation, brush chopping, shearing and windrowing, and bedding on contour, were measured during the 1976 and 1977 water-years on 3 small watersheds on steep terrain in northern Mississippi

After site preparation, the treated watersheds were fertilized, limed, sown with clover, and planted with loblolly pine seedlings. An undisturbed watershed served as a control. Site preparation exposed soil on 37% of the chopped watershed, on 53% of the sheared and windrowed watershed, and on 69% of the bedded watershed. First-year sediment losses for the chopped, sheared, bedded, and control watersheds were 12.5, 12.8, 14.2, and 0.6 metric tons/ha, respectively. Sediment concentrations for the 4 watersheds were 2,471; 2,837; 2,127 mg/liter of stormflow. Most of the first-year sediment losses occurred during months of highest stormflows, November, January, February, and March. Stream channel scouring was a major source of sediment on the site prepared watersheds. Second-year sediment yields from the chopped, sheared, and bedded watersheds decreased to 2.3, 2.2, and 5.5 metric tons/ha, while sediment from the control watershed decreased to 0.1 tons/ha. Sediment concentrations were 670, 794, 2,346, and 393 mg/liter for the 4 watersheds. In relation to annual precipitation, total stormflow decreased on all treated watersheds the second year. CROP RESIDUE MANAGEMENT FOR WIND EROSION CONTROL IN THE GREAT PLAINS,
Science and Education Administration, Manhattan, KS.
E. L. Skidmore, M. Kumar, and W. E. Larson.
Journal of Soil and Water Conservation, Vol. 34, No. 2, p 90-94, March-April 1979. 6 fig, 3 tab, 16 ref.

Descriptors: *Soil erosion, *Great Plains, *Wind erosion, *Erosion control, Land management, Soil conservation, Cultivated lands, Mulching, Grains(Crops), Crops, Barley, Oats, Corn(Field), Sorghum, Soil management, Crop residues.

The authors delineated those croplands in the Great Plains where crop residues might be removed without exposing the soil to wind erosion. On the basis of grain yield data, they estimated the residues produced per unit of land by crops. Also determined were the mean soil erodibility and climatic factors for each of 29 major land resource areas. These factors were used in the wind erosion equation to estimate the residues needed to control wind erosion. The residues produced in excess of those needed for soil conservation depend on the kind and amount of residues, soil erodibility, climate, tillage management, and judgment of erosion and degradation hazard. Better management of these residues would enhance their ability to conserve soil and water and increase soil productivity. Removing residues from fields for other uses should be done judiciously and with an understanding of the consequences. (Humphreys-ISWS)

TILLAGE AND PLANT RESIDUE MANAGEMENT FOR WATER EROSION CONTROL ON AGRICULTURAL LAND IN EASTERN OREGON,
Science and Education Administration, Pendleton, OR. Columbia Plateau Conservation Research Center.
R. R. Allmaras, S. C. Gupta, J. L. Pikul, and C. E. Johnson.
Journal of Soil and Water conservation, Vol. 34, No. 2, p 85-90, March-April 1979. 1 fig, 7 tab, 14 ref.

Descriptors: *Erosion control, *Soil conservation, *Farm management, *Oregon, Crops, Wheat, Fallowing, Effects, Soils, Slopes, Rainfall, Erosion, Contour farming, *Tillage practices, *Crop residue, Soil loss, Residue removal, Residue production.

The authors estimated soil erosion by water in the major land resource areas (B7, B8, B9) of eastern Oregon. Combinations of tillage and crop residue handling, terracing, and contouring were evaluated as control alternatives. Wheat-fallow, especially, and wheat-pea sequences predominated. Soil erosion exceeded tolerance limits in the wheat-fallow sequence on slopes over 20% even with all 3 management inputs. All 3 management inputs were needed on slopes between 12 and 20%. Tillage and residue management, along with contouring, sufficed on slopes less than 12%. The 3 major land resource areas in eastern Oregon (1.94 million hectares) produce 1.3 million metric tons of small grain residues annually, 60% of which can be harvested from 88% of the 344,200 hectares harvested. CROP RESIDUE REQUIREMENTS FOR WATER EROSION CONTROL IN SIX SOUTHERN STATES,
Science and Education Administration, Florence, SC. Coastal Plains Soil and Water Conservation Research Center.
R. B. Campbell, T. A. Matheny, P. G. Hunt, and S. C. Gupta.
Journal of Soil and Water Conservation, Vol. 34, No. 2, p 83-85, March-April 1979. 4 fig, 1 tab, 9 ref.

Descriptors: *Erosion control, *Alabama, *Mississippi, *Soil conservation, *Soil erosion, *Farm management, *Southeast U.S., Erosion, Crops, Corn, Soybeans, Grains(Crops), Cotton, Sorghum, Effects, Soils, Rainfall, Agriculture, *Tillage practices, *Crop residue, Residue production, Residue removal, Soil loss.

The authors calculated the crop residues needed for water erosion control in 6 southern states. Six crop sequences were evaluated in each of 14 major land resource areas (MLRA). In 13 of 14 MLRAs, weighted average estimated soil loss exceeded tolerable limits. The exception was MLRA 153, Atlantic Coastal Flatwoods, where the greatest percentage of residues remains available after water erosion control needs are met. In 4 of 6 states, 6 million metric tons (6.6 million tons), or 60% of crop residues, are needed for water erosion control. The remaining 40% is available for other uses. In Alabama and Mississippi about 90% of the residues produced are needed for water erosion control. (Sims-ISWS)
W79-07341

TILLAGE AND CROP RESIDUE EFFECTS ON SOIL EROSION IN THE CORN BELT,
Science and Education Administration, Morris, MN.
M. J. Lindstrom, S. C. Gupta, C. A. Onstad, W. E. Larson, and R. F. Holt.
Journal of Soil and Water Conservation, Vol. 34, No. 2, p 80-82, March-April 1979. 3 fig, 3 tab, 6 ref.

Descriptors: *Erosion control, *Soil erosion, *Farm management, *Soil conservation, *Corn Belt, Erosion, Crops, Effects, Corn(Field), Soybeans, Grains(Crops), Soils, Rainfall, Agriculture, *Tillage practices, *Crop residue, Residue production, Residue removal, Soil loss.

Potential soil erosion by water was calculated for major land resource areas (MLRAs) in the Corn Belt using the universal soil loss equation and current cropping practices. Annual erosion rates ranged from 44.7 metric tons per hectare (19.9 t/a) in MLRA 107 to 9.7 metric tons per hectare (4.3 t/a) in MLRA 103 for a conventional fall-plow, spring-disk tillage system with all residues removed. With no conservation practices applied, only 36% of the cultivated area in the Corn Belt would have a soil erosion rate less than or equal to the allowable limits established by the Soil Conservation Service. Use of tillage and residue management systems increases this area to 78%. When soil erosion is the only restraint, the maximum amount of residues that can be removed from cropland in the Corn Belt is 58% of the total produced. Most of this is located in 4 of the 14 MLRAs. However, variations in residue production and the erosion index within MLRAs pose serious limitations to removal of large amounts of residues for other uses. (Sims-ISWS)
W79-07342

PREDICTING THE EFFECTS OF TILLAGE AND CROP RESIDUE MANAGEMENT ON SOIL EROSION,
Science and Education Admin., St. Paul, MN.
S. C. Gupta, C. A. Onstad, and W. E. Larson.
Journal of Soil and Water Conservation, Vol. 34, No. 2, p 77-79, March-April 1979. 3 fig, 4 tab, 14 ref.

Descriptors: *Erosion control, *Soil erosion, *Farm management, Crops, Effects, Erosion, Corn(Field), Soybeans, Grains(Crops), Soils, Slopes, Rainfall, Agriculture, Soil conservation, *Tillage practices, *Crop residue, Residue production, Residue removal, Soil loss, Erodibility, Row crops.

Using the universal soil loss equation, those areas were delineated from which crop residues could be removed from the soil surface for other uses without erosion exceeding the soil loss tolerance limit. The amount of crop residues produced were calculated and the amounts available for removal were determined. The sources of data and computation procedures used in this study were presented and the kind of information available from the computer analysis was illustrated. (Sims-ISWS)

REDUCTION OF SOIL EROSION BY THE NO-TILL SYSTEM IN THE SOUTHERN PIEDMONT,
Southern Piedmont Conservation Research Center, Watkinsville, GA.
G. W. Langdale, A. P. Barnett, R. A. Leonard, and W. G. Fleming.
Transactions of the American Society of Agricultural Engineers, Vol. 22, No. 1, p 82-86, 92, January-February 1979. 6 fig, 3 tab, 17 ref.

Descriptors: *Soil erosion, *Farm management, *On-site investigations, Crops, Runoff, Precipitation(Atmospheric), Rainfall, Sediments, Barley, Sorghum, Soybeans, Erosion, Erosion control, Agriculture, *Tillage practices.

Soil erosion control of row-cropped, Southern Piedmont lands is a constant problem. A 2.71 ha watershed, with an average slope of 3.4%, was

equipped with a 0.76 m H-flume in summer of 1972 to study runoff and soil losses from row crop land. The watershed treatments were conventional till, without terraces or grassed waterways, during the first 2 yr in a soybean-fallow sequence, and then 2 yr of no-till double cropped barley, followed by grain sorghum with a fescue grassed waterway. Annual runoff was decreased from 22.5 cm (17.6%) with conventional tillage to 12.0 cm (9.7%) with double cropped, no-till practices. Runoff was reduced 90% during the vulnerable sediment and chemical transport season of May, June, and July. Annual flume-measured sediment decreased from 26.26 t (metric tons)/ha (11.71 tons/acre) with conventional tillage to 0.13 t/ha (0.06 ton/acre) with no-tillage. Soil loss values associated with no-tillage showed that crop row direction is not important when no-tilling is accompanied with grassed waterways in the Southern Piedmont. Barley and grain sorghum both produced 15.43% t/ha (6.88 tons/acre) of grain during the no-till period. Annual erosion, estimated by the Wischmeier-Smith erosion equation, was 71.23 t/ha (31.80 tons/acre) and 1.30 t/ha (0.58 ton/acre) for conventional and no-till, respectively. (Sims-ISWS)

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

EFFLUENT WATER QUALITY DISCHARGED FROM THREE OYSTER SHELLSTOCK WASHERS,
Maryland Univ., College Park. Dept. of Agricultural Engineering.
F. W. Wheaton, S. C. Chang, and A. L. Ingling.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 463, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Research Center, Maryland University, Completion Technical Report No. 54, April 1979. 104 p, 18 fig, 28 tab, 8 ref, 1 append. OWRT A-033 MD(3).

Descriptors: *Waste water, *Effluents, *Oysters, *Cleaning, Equations, Liquid wastes, Biochemical oxygen demand, Chemical oxygen demand, Solids, Suspended solids, Phosphates, Nitrogen compounds, Waste identification, Water analysis, Shellfish, Water quality standards.

To determine the most desirable method of washing oyster shellstock, three different washing devices were evaluated. The cleaning efficiency, water requirements and discharge water quality of a spray washer, a brush washer and a tumbler washer were compared. Regression equations were developed to predict the ratio of foreign material removed from a bushel of oysters run at various washer settings to the weight of foreign material removed from a bushel of oysters run at a standard setting of the brush and spray washers. Tests with the tumbler washer were terminated before a regression analysis could be made, because the tumbler washer severly damaged the oysters. An analysis of the effluent water quality showed that Kjehdahl nitrogen, orthophosphate, hydrolyzable phosphate and total phosphates, residual chlorine and chloride concentrations were too low to present problems in meeting waste water discharge regulations. Tests for BOD5, COD and suspended, filterable, and settleable solids indicate that some treatment will be necessary for solids removal from the washer effluent. The washer effluent pH averaged about 8.1 to 8.2, which was within the 6 to 9 range permitted by discharge regulations. Standard plate count often exceeding 300,000 MPN/100 ml and total coliform ranging from 59 to over 1,600 MPN/100 ml were too high for direct discharge. (Davison-IPA)

THE ALSTERBERG (AZID) MODIFICATION OF THE WINKLER METHOD FOR THE DETERMINATION OF THE BOD OF INCINERATOR QUENCH WATER AND THE CALIBRATION OF THE WESTON AND STACK DO ANALYZER MODEL 300-B,
Bureau of Solid Waste Management, Cincinnati, OH.
D. L. Wilson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 953, Price codes: A03 in paper copy, A01 in microfiche. Report 1970. 39 p, 1 tab, 5 ref.

Descriptors: *Biochemical oxygen demand, *Incineration, *Quenching, *Analytical techniques, *Pollutant identification, Water analysis, Standards, Laboratory tests.

The Alsterberg (Azide) Modification of the Winkler Method utilizing dilution water is employed to standardize the Weston and Stack DO Analyzer and to determine the BOD of incinerator quench water. Preliminary tests are presented which evaluate the applicability of the Alsterberg (Azide) Modification in the determination of BOD. The test can not be employed if the diluted sample contains more than 4 ppm nitrate, or 1 ppm ferrous iron or 200 ppm ferric iron, or any sulfite or thiosulfate, or large amounts of chloride. Standards must be employed to verify the validity of the preliminary analyses and reveal to the analyst knowledge of the color intensity and hue. The principle of the test, apparatus, reagents, standardization, and sample analyses are presented. Since the tests are not specific and give a positive reaction in the presence of several substances, the tests are assigned group numbers. The sample analyses presented are for eight groups, one group for each of the interfering substances. (Small-FRC)
W79-07034

DEVELOPMENT OF A CHEMILUMINESCENT AND BIOLUMINESCENT SYSTEM FOR THE DETECTION OF BACTERIA IN WASTEWATER EFFLUENT,
Boeing Co., Houston, TX.
R. R. Thomas.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-23824, Price codes: A03 in paper copy, A01 in microfiche. Report NASA-CR-144750, 1975. 48 p, 12 fig, 6 tab, 9 ref, 2 append.

Descriptors: *Bioluminescence, *Monitoring, *Chemical analysis, *Sewage bacteria, *Chemical reactions, Analytical techniques, Catalysts, Light intensity, Light quality, Pollutant identification, Waste water, Effluent streams.

Automated chemiluminescent and bioluminescent sensors were developed for continuous monitoring of bacteria in waste water effluent. In the chemiluminescent system, the optimum reagent concentrations were identified as 0.00025 M luminol, and 0.0125 M sodium perborate in 0.75N sodium hydroxide prior to addition of the sample. New techniques developed for increased sensitivity and specificity included extraction of porphyrins from bacteria collected in a filter using 0.1N NaOH-50% ethanol, and the use of the specific reaction rates for different luminol catalysts. Because the reaction times are different for each catalyst, a specified reaction for bacteria can be achieved by measuring only the light emission fromthe particular reaction time zone specific for bacteria. Flow system design modifications were developed for the bioluminescent firefly luciferase system. (Lisk-FRC)

DETERMINATION OF ACID-BASE AND SOLUBILITY BEHAVIOR OF LIGNITE FLY ASH BY SELECTIVE DISSOLUTION IN MINERAL ACIDS,
Missouri Univ.-Columbia. Dept. of Chemistry.
J. B. Green, and S. E. Manahan.
Analytical Chemistry, Vol. 50, No. 14, p 1975-1980, December 1978. 2 fig, 4 tab, 25 ref. OWRT A-106-MO(3). 14-34-001-8027.

Descriptors: *Fly ash, Acids, Titration, Trace elements, Lignite.

A method has been developed for the chemical analysis of fly ash which gives the total available base in the ash. This method is based upon the dissolution of fly ash in mineral acid accompanied by analysis of major metal ion constituents and sulfate. The amount of base obtained from fly ash through direct reaction with acids is much greater than that obtained from dissolution in pure water, a fact of significance in the chemical utilization of fly ash. Fly ash dissolves in discrete steps with increasing acidity, thereby indicating the presence of specific fractions within the material.
W79-07127

OBSERVATIONS ON THE GEOCHEMISTRY OF SOLUBLE COPPER, IRON, NICKEL, AND ZINC IN THE SAN FRANCISCO BAY ESTUARY,
Johns Hopkins Univ., Baltimore, MD. Chesapeake Bay Inst.
A. Eaton.
Environmental Science and Technology, Vol. 13, No. 4, p 425-432, April 1979. 5 fig, 6 tab, 47 ref. Dep. Energy EY-76-S-02-3292.

Descriptors: *Metals, *Estuaries, *Water pollution, *California, Pollutants, Path of pollutants, Trace elements, Bays, Copper, Iron, Nickel, Zinc, Sampling, Chemical analysis, Water chemistry, Regression analysis, Water quality, *San Francisco Bay.

At discharges of 300-400 cu m/s, surface waters of the San Francisco Bay estuary contain dissolved Cu and Ni at levels of 1 to 4 ppb. This is approximately an order of magnitude higher than waters outside the Bay. Zn concentrations are 2-6 ppb within the estuary and generally less than 1 ppb outside. Cd concentrations are 0.08 to 0.2 ppb within the estuary and 0.05 to 0.11 ppb outside. The behavior of all these elements is probably dominated by physical processes during most seasons, although Cu shows evidence for removal during summer months when river flow is low. Cu, Ni, and Zn show an excess of about 1 ppb relative to conservative mixing in the more saline portion of the estuary. This excess was attributed to municipal and industrial discharges. (Sims-ISWS)

HERBICIDE RUNOFF FROM UPLAND PIEDMONT WATERSHEDS--DATA AND IMPLICATIONS FOR MODELING PESTICIDE TRANSPORT,
Southern Piedmont Conservation Research Center, Watkinsville, GA.
R. A. Leonard, G. W. Langdale, and W. G. Fleming.
Journal of Environmental Quality, Vol. 8, No. 2, p 223-229, April-June 1979. 5 fig, 5 tab, 23 ref.

Descriptors: *Herbicides, *Pesticides, *Runoff, *Water quality, On-site investigations, Model studies, Mathematical models, Rainfall, Crops, Sediments, Soils, Pollutants, Path of pollutants, Agri-

cultural chemicals, Paraquat, Atrazine, Diphenamid, Cyanazine, Propazine, Trifluralin.

Runoff and persistence of selected herbicides were studied on 4 small Piedmont watersheds in Georgia during 4 growing seasons. This was part of a study designed to provide data for developing and testing mathematical models for agricultural chemical transport. Seasonal runoff losses were determined relative to watershed management, herbicide type and persistence, mode of application, and time of runoff in relation to application timing. Seasonal losses were usually less than 2% of the application, unless large runoff volumes were generated shortly after application. Average storm herbicide concentrations in runoff were correlated with herbicide concentrations at the 0- to 1-cm depth increment of the watershed soils at the time of runoff. Paraquat concentrations in runoff (predominantly sediment associated) were well correlated and positive with the product of soil herbicide concentration and sediment in runoff. Equations describing soil-based herbicide transfer to runoff were power functions with exponents near unity with the form: $Y = a x$ to the b power. Simple relationships such as those developed in this study along with hydrology and erosion/sediment models may be useful in predicting pesticide runoff potential when assessing relative impacts of management decisions. The next step would be to describe key management practices in terms of these coefficients and exponents. (Sims-ISWS)

TRACE ELEMENTS IN FLY ASH AND THEIR RELEASE IN WATER AND TREATED SOILS,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
H. T. Phung, L. J. Lund, A. L. Page, and G. R. Bradford.
Journal of Environmental Quality, Vol. 8, No. 2, p 171-175, April-June 1979. 3 fig, 4 tab, 22 ref.

Descriptors: *Fly ash, *Trace elements, *Soils, Laboratory tests, Chemicals, Heavy metals, Powerplants, Coal, Wastes, Waste disposal, Pollutants, Path of pollutants, Water pollution, Soil water, Hydrogen ion concentration, Acids, Alkalinity.

Fly ash from a coal-fired power plant was separated into various-sized fractions which were then chemically characterized. The fly ash contained higher concentrations of B, Co, Cr, Cd, Mo, Ni, Pb, As, and Se than normally found in soils. Except for Cd, Co, and Pb, trace elements were more concentrated in the less than 53 micrometers than in the greater than 250 micrometers fraction. Solubility of trace elements in water increased greatly as the equilibrium pH was lowered. Three soils, an acid sand, a calcareous loamy sand, and a calcareous silt loam, were amended with 5 rates of fly ash up to 1% by weight and equilibrated at moisture contents of 1/3 bar or saturation for periods ranging up to 29 weeks. Solubility of trace elements in water and DTPA extracts was observed. Application of fly ash increased soil pH; the acid soil exhibited the greatest increase. Except for B, fly ash amendment up to 1% did not result in elevated concentration of either water-soluble or DTPA-extractable trace elements. Additions of fly ash to the acid soil decreased DTPA-extractable Fe, Mn, Ni, Co, and Pb. The data demonstrated that the alkalinity of fly ash plays a significant role in regulating the availability of trace elements in the amended soils. (Sims-ISWS)

HEAVY METALS PARTITIONING IN A STREAM RECEIVING URBAN RUNOFF,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
W. D. Lorenz. Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 725, Price codes: A09 in paper copy, A01 in microfiche. M.S. Thesis, May, 1978. 196 p, 58 fig, 49 tab, 94 ref. OWRT B-103-VA (1).

Descriptors: *Urban runoff, *Heavy metals, Stormwater drainage, Sewage effluent, Spectrophotometry, Land use, Nonpoint pollution.

Water, sediment detritus, caddisflies, snails, and crayfish were collected from Bull Run, July 31-Oct. 2, 1977 and analyzed for Fe, Mn, Ni, Pb, Cd, Zn, Cr, and Cu by atomic absorption spectrophotometry after digestion and extraction procedures. Samples were collected from six sampling stations which received sewage effluent, urban runoff, and stormwater drainage from the Manassas, Virginia, area. Concentrations of Pb and Cu in water, sediment, detritus, and caddisflies increased with increasing distance downstream and were significantly (0.95 level) greater in these components immediately below the stormwater input than at the upstream control. Concentrations of Pb in sediment collected at a downstream station were significantly greater than those at the control station even though the control sediment characteristics favored metal retention more than the downstream sediment characteristics. Mean Cu concentrations in sediments at this station were greater than at the upstream control station while all other metals were concentrated the least in sediment at the downstream station. Significant (0.95 and 0.99 level) linear correlation coefficients among a majority of stream components were found for Pb and Cu. It appears that urban runoff and stormwater drainage contributed sufficient quantities of Pb and Cu into Bull Run such that these metals accumulated greater in stream components below the Manassas urban area.

THE INVERTIBRATE FAUNA AND BIOTIC INDEX VALUE OF WATER QUALITY OF THE GREAT BERG RIVER, WESTERN CAPE,
Jonkershoek Forest Research Station, Stellenbosch (South Africa).
A. Coetzer.
Journal of the Limnological Society of Southern Africa, Vol. 4, No. 1, p 1-7, July 1978. 2 tab, 9 ref.

Descriptors: *Water pollution, *Pollutant identification, *Benthic fauna, *Great Berg River(Western Cape Southern Africa), Bioindicators, Sampling, Bottom sampling, Water analysis, Water quality, Water pollution effects, Annelids, Equipment, Nets, Analytical techniques.

Invertebrate fauna samples were taken at seven locations along the main stream of the Berg River at three different periods during 1974, and analyzed to assess the condition of the river. In addition to ascertaining changes in riverine fauna occurring since 1952, this study was designed to determine whether the biological index method modified by Chutter is applicable to conditions in the Western Cape. The river habitat at all sampling localities is described. The benthic organisms collected are tabulated for comparison with a 1958 survey. Results of this comparison indicate increased pollution. The 1958 survey revealed that mild pollution favored Orthocladiinae, Chironominae, Baetis harrisoni and Nais spp. and that taxa typical of the upper zones disappear entirely under conditions of mild pollution. Orthicladinae were present at all locations except two during the present survey. Annelids increased at the location with low aeration and impaired purity, a definite indication of pollution. Of the total fauna sampled, a greater percentage were found to be pollution favoring organisms in the present survey than were found in an earlier survey. It is concluded that the Chutter method satisfactorily indicated the pollution status of the Berg River. (Davison-IPA)

THE EFFECT OF TEMPERATURE ON SPECIFIC GROWTH RATE AND ACTIVATION ENERGY OF MICROCYSTIS AND SYNECHOCOCCUS ISOLATES RELEVANT TO THE ONSET OF NATURAL BLOOMS,
Orange Free State Univ., Bloemfontein (South Africa). Dept. of Botany.
G. H. J. Kurger, and J. N. Eloff.
Journal of the Limnological Society of Southern Africa, Vol. 4, No. 1, p 9-20, July 1978. 12 fig, 4 tab, 28 ref.

Descriptors: *Algae, *Growth rates, *Temperature, *Activation energy, *Eutrophication sources, Laboratory tests, Laboratory equipment, Cultures, Light intensity, Light penetration, Impoundments.

The effect of temperature on the growth of two toxic and two non-toxic Microcystis was investigated to determine the correlation between temperature and appearance of Microcystis blooms in nature. The Microcystis lower temperature limit varied between 10.5 and 13.5C, thermal growth optimum varied between 28.8 and 30.5C, and the upper temperature limit varied between 35.0 and 40.0C. The corresponding values for Synechococcus were 10.3, 34.5, and 44.3C. Saturating light intensities could not be used because the construction of the apparatus did not permit the cultures to remain stationary. The lower temperature limit, thermal growth optimum, and the upper temperature limit were influenced by increasing the light intensity. Arrhenius equations and Q10 values were calculated, and activation energies were calculated for the different isolates from the respective Arrhenius plots. The temperature value for the onset of natural blooms of Microcystis coincided with an inflection in the gradient of the Arrhenius plot, indicating a sudden decrease in activation energy and an increase in Q10 above 17.5C. Useful predictions of specific growth rates under natural conditions may be possible through the use of Arrhenius equations such as those computed in this study. (Davison-IPA)

THE FRACTIONATION OF CLAY SIZED PARTICLES FROM THE WURAS DAM WATER PHASE,
Orange Free State Univ., Bloemfontein (South Africa). Inst. of Environmental Sciences.
A. J. H. Pieterse.
Journal of the Limnological Society of Southern Africa, Vol. 4, No. 1, p 77-79, July 1978. 2 tab, 9 ref.

Descriptors: *Impounded waters, *Suspended solids, *Clays, *Turbidity, *Separation techniques, Dams, Wuras Dam(South Africa), Water pollution sources, Water quality, Water quality control, Coulter Counter, Particle size.

The Coulter Counter, successfully used to estimate the number and sizes of suspended particles in sea water, was applied to Wuras Dam, a turbid man made lake in South Africa. Larger sized clay particles occur in high concentrations in the inflow water and in the water of the dam proper. Fractionation of particles between ca 1 and 2 micromillimeters in diameter have been achieved; a higher concentration of small sized particles occurred in the dam water while concentration of the larger particles was lower. Estimates of the surface area were made for each size fraction. Considerable surface areas were associated with the various particle size fractions. Due to a higher concentration of the 1.09 micromillimeter particle fraction, the total surface area of the coarse clay sized particles of the water at the dam wall was greater than that of the inflowing water. Assuming these estimates represent a close approximation of the surface areas present in this water, and that the surfaces are an important limnological feature, it is possible that many conditions and processes in Wuras Dam are most likely governed by the suspended particles. (Davison-IPA)

USING YOUR COMPUTER TO FILE WELL LOGS,
R. B. McDannald.
Water Well Journal, Vol. 33, No. 6, p 30-31, June,

1979. 3 fig.

Descriptors: *Computer programs, *Well data, *Drillers logs, Data collections, Water wells, Data processing, Data storage and retrieval.

The operation of a simple well log computer program is explained. The program has three routines: file creation, file sort, and file search. Data required for the file creation routine are: township name and section, street name and number, customer name, well diameter, depth, pump depth, bedrock depth, static level, drawdown, gpm, core type, log number, and date. In the file sort routine the computer sorts out all the logs for a particular township and records them on a data cassette tape which can then be used in the file search routine to locate a particular well log in that township. MICROBIOLOGICAL CHARACTERISTICS OF URBAN STORM WATER RUNOFFS IN CENTRAL ONTARIO.
Ontario Ministry of the Environment, Toronto (Ontario).
Research Report No. 87, 1978, 130 p, 17 fig, 17 tab, 82 ref, 6 append. 75-3-24, 74-8-25, 76-8-41.

Descriptors: *Storm water, *Runoff, *Bacteria, Pollution, Viruses, Salmonella, Human diseases, Sampling, Rainfall, Infiltration, *Ontario, Fecal coliforms, Fecal sterols.

This volume contains three reports: (1) Microbiological Study of Some Canadian Storm Water Runoffs at Burlington and Brucewood, by Dutka, B. J., and Rybakowski, I., is a six-month study (June-November, 1975) to investigate the microbiological composition of storm water runoffs in Burlington, Ontario, and Brucewood (Toronto): (2) Microbiological Characteristics of Storm Water Runoffs at East York (Toronto) and Guelph Separate Storm Sewers, by Qureshi, A. A., is a six-month study to determine the microbiological characteristics of storm water runoffs at East York (Toronto) and Guelph separate storm sewers, and, (3) Monitoring of Storm Water Runoffs for Bacterial and Viral Pathogens of Man, by Dutka, B. J., and Tobin, S., is an eight-month project (April-November, 1976) to study the distribution of bacterial pathogens and viruses in storm water runoffs at the Malvern storm sewer outfall in central Burlington. A SIMPLE FLOATING MEAN CONCENTRATION SAMPLER,
Canada Centre for Inland Waters, Burlington (Ontario).
K. C. Miners.
Technical Bulletin No. 108 1978. 4 p, 12 fig.

Descriptors: *Water, *Lakes, *Sampling, *Floating, Effluents, Average, Design, Construction, Installation, *Concentration sampler, *Operating principle.

The requirement for an inexpensive reliable means of collecting time-integrated, near surface water samples at numerous stations around a point-source effluent, led to the development of an unpowered, moored sampler which could be deployed, serviced, and recovered by hand from a small boat. The sampler consists of a container held at a fixed depth on a ballasted spar. The interior of the container is vented to the atmosphere, and open to the ambient water mass via a nozzle assembly protected by a fine mesh filter. The pressure differential across the nozzle is sufficient to maintain a very small but constant flow into the container, such that sampling periods greater than twelve hours are achieved. By observing the assembly and operational precautions outlined in the text, the configuration described will operate reliably for at least several weeks. (WATDOC)

FLUOROMETRIC STUDIES ON THE TOXINS OF GONYAULAX TAMARENSIS AND APHANIZOMENON FLOS-AQUAE,
New Hampshire Univ., Durham. Dept. of Biochemistry.
N. H. Shoptaugh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 723, Price codes: A10 in paper copy, A01 in microfiche. Doctor of Philosophy Thesis, 1978. 199 p, 36 fig, 25 tab, 133 ref, 2 append. OWRT A-047-NH(1). 14-34-0001-7062.

Descriptors: *Shellfish, *Toxins *Fluorometry, Algal toxins, Colorimetry, Crabs, Mussels, Clams, Aquatic life, Bioassay, Pigments, Saxitoxin, *Blue-green alga.

The major objective was to develop a rapid, sensitive method for determining shellfish toxin content in clams, Mya arenaria, and mussels, Mytilus edulis, and to devise methods applicable for toxin detection in A. flos-aquae and in crabs, Cancer irroratus. Fluorometric techniques for detection of saxitoxin (STX) on thin-layer chromatography were shown to be more specific and 100 times more sensitive than many of the guanidine colorimetric reactions on thin-layer chromatography. The oxidation of STX with alkaline hydrogen peroxide followed by acidification produced a solution fluorophor with an excitation of 332 nm and an emission of 381 nm. The solution fluorometric assay quantitated as little as 0.005 to 0.01 micrograms STX. Reaction pH, temperature, time, and hydrogen peroxide concentration, as well as exposure to external light and various ions, purines, and proteins had an effect on the fluorescence intensity of the STX fluorophor. The alkaline hydrogen peroxide oxidation of A. flos-aquae extracts produced a fluorophor with 330 nm excitation and 380 nm emission maxima. The temperature-time profile of the Aphanizomenon fluorophor indicated that it showed a greater temperature sensitivity than the STX fluorophor. The pigmentation present in the solution fluorometric assay produced varied results that did not correlate consistently with the mouse bioassay. The Aphanizomenon toxin fluorophor applied to and eluted from the strong cation exchange column showed a behavior similar to the STX fluorophor. The application of the column fluorometric procedure to the quantitation of Aphanizomenon toxin yielded values comparable to the mouse bioassay using a STX standard.

LOW-MOLECULAR-WEIGHT HYDROCARBON AND HYDROGRAPHIC PROJECT,
Texas A and M Univ., College Station. Dept. of Oceanography.
W. M. Sackett, J. M. Brooks, B. B. Bernard, and C. R. Schwab.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol. I,' p 3-1 - 3-128, January 15, 1979. 52 fig, 25 tab, 56 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Hydrography, *Water pollution sources, *Seepage, Environmental effects, Texas, Methane, Propene, Resources development, Texas, *Outer Continental Shelf, *Hydrocarbons, Petroleum development, Ethene, South Texas Outer Continental Shelf(STOCS).

A comprehensive tabulation and analysis of all low-molecular-weight hydrocarbon (LMWH), dissolved oxygen, and nutrient data taken as part of the BLM South Texas Outer Continental Shelf (STOCS) program in 1977 is presented. Methane showed considerable variation in the STOCS area waters. Near-bottom seepage was detected in bottom waters at some stations. Ethene and propene showed the same general trend as productivity; low surface values were observed in the winter with higher values in the spring, summer and fall. Ethene generally showed a maximum at some shallow depths (20 to 40 m) in the water column. The olefins generally dominated over their saturated analogs in the STOCS area. The lower Texas shelf is relatively 'clean', as most of the light hydrocarbons on this shelf are presently derived from natural sources. Oxygen values are controlled throughout most of the year in the upper 50 to 70 m of the STOCS area by physical processes. Nutrient concentrations were typically low, being representative of open Gulf surface water. Nitrate was limiting to productivity and disappeared during the summer and early fall. Phosphate and silicate were affected by the spring increase in productivity but were generally regenerated by fall. Increased continental runoff during the spring months was reflected by high silicate values at nearshore stations. (See also W79-07287) (Sinha-OEIS)

A STUDY OF STORMWATER RUNOFF QUALITY,
Rice Univ., Houston, TX. Dept. of Environmental Science and Engineering.
W. G. Characklis, P. B. Bedient, F. G. Gaudet, and F. L. Roe.
Progress in Water Technology, Vol. 10, No. 6, p 673-699, 1978. 11 fig, 8 tab, 9 ref.

Descriptors: *Storm runoff, *Texas, *Water quality, *Cities, *Urban runoff, Pollutants, Pollutant identification, Runoff, Sampling, Suspended solids, Sediments, Chemicals, Nutrients, Chemical oxygen demand, Carbon, Nitrogen, Phosphorus, Dissolved oxygen, Chlorinated hydrocarbon pesticides, Bacteria, Sediment control, Water pollution, *Houston(TX).

The stormwater from 4 watersheds in the Houston area was monitored by an intensive sampling and analytical program over a 3 year period. The land use in the watersheds included undeveloped forest, developing forest, fully developed residential, and mixed commercial-residential. Chemical parameters monitored included suspended solids, oxygen demand, organic carbon, nitrogen, phosphorous, dissolved oxygen, pH, specific conductance, and chlorinated hydrocarbons. Indicator and pathogenic bacterial content were enumerated as well as aquatic and edaphic algae species. Disinfectant demand and algal bioassays were also conducted. Relationships were developed between stormwater runoff quality, quantity, and land use in an effort to predict pollutant loads. The appearance of a 'first flush' was dependent on the parameter measured and the watershed characteristics. Rainwater quality contributes significantly to stormwater pollutant load, especially in urbanized areas. The modifying effect of natural biological processes on nitrogen content in the runoff and the effects of the hydrological regime on nutrient limitations were observed. The effectiveness of storage lakes, very positive in the case of suspended solids, was described. (Sims-ISWS)

AN EVALUATION OF NON-SPECIFIC MEASUREMENTS ON ORGANIC POLLUTANTS IN WATERS AND WASTEWATER,
Victoria State Rivers and Water Supply Commission, Victoria (Australia).
T. D. Waite.
Australian Water Resources Council Technical Paper No. 34, 1978. 171 p, 59 fig, 34 tab, 195 ref, 5 append. 74/66.

Descriptors: *Pollutant identification, *Water pollution, *Organic wastes, *Decomposing organic matter, *Chemical wastes, *Biochemical oxygen demand, Analytical techniques, Mathematical models, Water pollution control, Water analysis, Laboratory tests, Water chemistry.

To facilitate decisions in setting standards for organics in Australian water, a study with the following objectives was undertaken: (1) to investigate the usefulness of the biochemical oxygen demand (BOD) test; (2) to study other established methods for measuring the organic content of waters and compare them with the BOD test; and (3) to investigate other non-specific analytical techniques which may assist in explaining the nature and quality of organics in waters. The relationships between the various techniques used to measure organic concentration in waters are discussed, and data and results from literature regarding organic carbon-oxygen demand correlation are reviewed. Methods for measuring biodegradable and non-biodegradable organics in water and the potential role of organic carbon measurements in water pollution control are examined. An interpretation of BOD kinetics is presented. Results of experiments relating analytical techniques responses to the degredation of raw sewage samples are discussed stressing the effect of the changing ratio of biodegradable organics to refactory organics. The interpretation of these results involves mathematical modeling of oxygen uptake and substrate removal curves. It is concluded that although several tests are available to indicate the magnitude of organic contamination of waters, the BOD5 test is still used by many authorities as the major indicator of organic pollution. APPARATUS AND METHOD FOR ANALYZING OIL CONTENT OF WATER,
Delray Electronics Inc., Westville, NJ. (Assignee).
F. Malley, and R. F. Akers.
U.S. Patent No. 4,137,494, 6 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 5, p 1859, January 30, 1979.

Descriptors: *Patents, *Pollutant identification, *Water pollution, *Oil pollution, Organic wastes, Oily water, Electronic equipment, Electrodes, Ion transport.

The object of this invention is to provide a small and rugged detection device which is adapted to detect trace amounts of organic molecules in water, and which is adapted to operate efficiently and reliably at the site of the water which is to be tested. An oil content analyzer device contains a degradable ion transport cell designed to present a changing internal impedance as a function of the oil content of water flowing through it. The cell is comprised of two electrodes made of dissimilar metallic compositions with a hydrocarbon-absorbing material sandwiched between, and housed in a container having openings to permit the water to flow through. In operation, a sample of water is circulated through the device with the result that the electrical output characteristics of the device change as a function of the amount of hydrocarbons absorbed in the membrane element and an electrical signal is generated which is inversely proportional to the oil content of the analyzed water sample. (Sinha-OEIS)

MICROSUBSTANCES IN URBAN STORM WATER,
Chalmers Univ. of Technology, Goteborg (Sweden). Dept. of Water Supply and Sewerage.
B. Horkeby, and P-A. Malmquist.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 252-264, 1977. 8 tab, 17 ref.

Descriptors: *Microsubstances, *Effects, *Water quality, *Chemical analysis, *Storm water, *Goteborg(Sweden), Waste water(Pollution), Heavy metals, Organic compounds, Sludge, Drinking water, Standards, Concentrations, Sampling, Receiving waters, Atmospheric fallout.

During 1976 a catchment in Goteborg was investigated with respect to microsubstances in storm water and atmospheric fallout. The microsubstances studied were 17 heavy metals and PCB, DDT with derivatives, HCB and PAH. The concentrations of heavy metals in storm water were not remarkably high compared with those in waste water and sometimes in drinking water. For As, Cd, Cr, Hg, Sb, V, and Pb, atmospheric fallout could explain a great deal of the metal content in the storm water. For the other metals, only a smaller fraction could be explained by atmospheric fallout. Most of the heavy metals originate from traffic and from corrosion. The concentrations of PCB, DDT, and HCB were relatively low compared to results of earlier investigations of dustfall. The concentration of PAH in the storm water was high (10-320 micrograms of naftalene-equivalents/l unfiltered sample), on one occasion even higher than in waste water. Most of the PAH was found to be attached to particles. Applications of the different microsubstances and their effects on man, flora, and aquatic fauna are given. QUALITY OF COMBINED SEWER OVERFLOWS FROM URBAN AND SEMI-URBAN AREAS IN RICHMOND, VIRGINIA, USA,
Virginia State Water Control Board, Richmond. Piedmont Regional Office.
K. C. Das.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 265-276, 1977. 1 fig, 6 tab.

Descriptors: *Water quality, *Combined sewers, *Overflow, *Basins, *Data analysis, *Richmond(Virginia), Urban runoff, Measurement, Land use, Biochemical oxygen demand, Pollutants, Rainfall, Dry weather, Concentrations, James River(Va).

Until very recently, waste loads from land, storm sewer, and combined sewer overflows have received very little in-depth evaluation as significant pollution sources. Studies indicate that the quantity of pollutants entering the James River at Richmond, Virginia is quite significant. Research has been underway for the past 30 months to determine the impact of 46 overflows at Richmond. The study consists of monitoring six of the representative sources utilizing automatic samplers and special flow measuring devices to define runoff characteristics. These six points were selected on the basis of land-use types including single family, multi-family, commercial, industrial, open space, and combinations thereof. Results indicate that the peak BOD concentrations for the storms considered at the single family sampling stations ranged from 80.0 to 434.0 mg/l. and suspended solids from 109.0 to 1320.0 mg/l.; for multi-family stations, BOD ranged from 44.0 to 850.0 mg/l. and suspended solids from 224.0 to 2240.0 mg/l.; for multiple land-use stations, BOD ranged from 63.0 to 232.0 mg/l. and suspended solids from 208.0 to 1620.0 mg/l. This clearly illustrates that the pollutional characteristics of combined sewer overflows are variable. 'First flush' of suspended solids and BOD is generally exhibited at each station including Shockhoe which has the largest drainage area of 7300.0 acres (29.542 x 10 to the sixth power m sq). The first flush is usually more pronounced in smaller basins. Results of this investigation will aid in reducing pollutant loads from combined sewer overflows to the James River at Richmond. W79-07454

THE CHARACTERIZATION OF PARTICULATE SOLIDS AND QUALITY OF WATER DISCHARGED FROM AN URBAN CATCHMENT,
Middlesex Polytechnic, London (England).
J. B. Ellis.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-IASH Publication No. 123, International Association of Hydrological Sciences, p 283-291, 1977. 6 fig, 1 tab, 17 ref.

Descriptors: *Water quality, *Storm water, *Runoff, *Urban catchments, *Particulate solids, Discharge(Water), Pollutants, Chemographs, Flow characteristics, Pollution loads, London(England).

The pollution loads resulting from storm water discharges to receiving streams in urban areas are primarily exerted by high concentrations of particulate materials. Chemographs for a separately sewered development in the northwest suburbs of Greater London show a double peaking of solids and a strong 'first-flush' phenomenon. Occasional lags of the flood wave behind the sediment wave are explained in terms of the flow characteristics and the growth of fungal mats in the sewer system. Pollutants are examined in terms of the characteristics, components and sizes of particulates discharged, and the importance for water quality of the solids fraction below 0.06 mm is demonstrated. W79-07456

HEAVY METALS IN WATER, SUSPENDED MATTER AND SEDIMENT,
Bayreuth Univ. (Germany, F.R.) Gehrstuehl fuer Hydrologie.
S. Wolfhard.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 339-343, 1977. 1 fig, 1 tab, 5 ref.

Descriptors: *Heavy metals, *Principal component analysis, Water bodies, Sediments, Suspended matter, Behavior, Water quality, Rivers.

Using principal component analysis, relationships are investigated between heavy metals in solution, suspended matter, and sediment. It can be shown that especially in former mining areas, the heavy metal content in sediment does not reflect the

properties of the water body except for Cu and Ni. Mn and Fe show no relationships at all. The heavy metal content of suspended matter is generally more influenced by sediment than by water. Nevertheless it may show quite a different behavior if special waste waters are discharged, like those containing Cd and Zn. Concerning temporal relationships between dissolved and suspended heavy metal contents, it is strongly suggested that the lack of significant correlations is due to comparison of different dimensions. At least in highly polluted rivers such interrelationships do exist. (See also W79-07426) (Bell Graf-Cornell)
W79-07463

THE MOVEMENT AND CHANGES IN CONCENTRATION OF CONTAMINANTS BELOW A SANITARY LANDFILL, PERTH, WESTERN AUSTRALIA,
Geological Survey of Western Australia, Perth.
T. T. Bestow.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977, IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 370-379, 1977. 4 fig, 1 tab, 3 ref.

Descriptors: *Water quality, *Contaminant concentration, *Hydrochemical studies, *Hydrogeology, *Movement, *Perth(Western Australia), Sanitary landfills, Aquifers, Water balance, Mass balance, Runoff, Equations, Hydrology, Tracer variance, Pollution plume.

A major sanitary landfill situated on the site of a former swamp near Perth has been the subject of a detailed hydrochemical study. Seven sets of boreholes have been used to periodically recover pumped samples from within the landfill and the underlying regional groundwater system over a period of three years. Study of the tracer variance in time and place shows that the components of the pollution plume fall into two groups: those due to natural evaporative concentration of the accession from rainfall and which are essentially stable with respect to time; and those which originate within the introduced land fill and show variance in both time and place. All components exhibit marked differences in ionic mobility in response to the control exercised by peat, which together with dilution in the main aquifer, brings tracer concentrations down to acceptable levels at nearby pumping boreholes. POLLUTION OF THE CHALK AQUIFER UNDER THE INDUSTRIAL BUILT-UP AREA OF ROUEN IN THE SEINE VALLEY,
Buerau de Recherches Geologiques et Minieres, Orleans (France). Dept. Carte Geologique et Geologie Generale.
J. C. Roux.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 408-420, 1977. 5 fig, 8 tab.

Descriptors: Alluvial plains, Industries, Chemical pollution, Aquifers, Hydrogeology, Pollutants, Rouen(France), Seine River(France).

This note discusses a case of permanent chemical pollution from industries situated on an alluvial plain. From 1970 to 1976, numerous analyses of samples from drillings in industrial areas in the Valley of the Seine near Rouen (France) resulted in the area being delimited into five zones of pollution around the main chemical industries. The chalk and alluvial aquifer was polluted by excessive amounts of major elements, as well as minor elements and trace metals, hydrocarbons and detergents. The observations over the study period reveal, on the one hand, a great variation in some elements and, on the other hand, an extension and increase of the pollution. In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 433-440, 1977. 6 fig, 2 tab.

Descriptors: *Water quality, *Reuse, *Effluents, *Waste water treatment, Treatment facilities, Pollutants, Sampling, Drinking, Rhine River(GFR).

Based upon 43 selected parameters with toxic or other properties that impede purification for drinking water purposes, the quality of effluents from waste water treatment plants was compared with that of the Rhine river water. Except the parameters TOC, COD, phosphate, trichloroethylene, 2, 4, 5-trichlorophenolm and zinc, the quality of the effluents from waste water treatment plants was on the average the same or even better than that of Rhine river water. Through certain measures--precipitation of phosphate, ozonization, filtration through activated carbon, passage through the river bank layers--most of these pollutants can be reduced so that the effluents can be made use of as raw water for drinking water purposes. 5B. Sources Of Pollution

PREDICTING PHOSPHORUS MOVEMENT AND PESTICIDE ACTION IN SALT MARSHES WITH MICROECOSYSTEMS,
Auburn Univ., AL.
J. W. Everest.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 457, Price codes: A05 in paper copy, A01 in microfiche. Doctoral Dissertation, August 24, 1978. 88 p, 7 fig, 10 tab, 110 ref. OWRT A-045-ALA(1).

Descriptors: *Ecosystems, *Salt marshes, *Path of pollutants, *Movement, *Pesticide kinetics, *Phosphorous, Pesticide toxicity, Toxicity, Herbicides, Snails, Gastropods, Pollutants, Soil contamination, Water pollution.

Microecosystems of a salt marsh community were designed and established to determine the mechanism by which phosphorous moves through the different physical and biological components of the community, and to determine the effect of the herbicide, fluometuron, in the salt marsh ecosystem. Tidal flow was simulated by connecting a 'tide machine' to the individual microecosystem seawater reservoirs. In the first study, 32P was inserted deep into the mud, and phosphorus movement was monitored at different times in the different biological and physical components. After four days significant amounts of 32P were found in the S. alterniflora leaves and on the soil surface, and appreciable amounts were found in the animal populations by the eighth day. The second study, using only S. alterniflora and soil with fiddler crabs as the experimental treatments, indicated that the burrowing habit of the fiddler crab appeared to cause a rapid turnover of phosphorus from deep within the soil. In the herbicide study the microecosystem was flooded with 100 ppm fluometuron in sea water. Within 30 days all of the plants were killed; S. alterniflora of all sizes were equally affected. The herbicide treatment completely prevented the emergence of new shoots from the rhizomes. The herbicide did not significantly affect the condition or number of horse mussel and periwinkle snail. It is concluded that microecosystems can be used to predict pollution effects in the natural marsh ecosystem. (Davison-IPA)

AVAILABILITY AND QUALITY OF GROUND WATER IN THE LAKE GEORGE AREA, SOUTHEASTERN PARK COUNTY, COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
K. E. Goddard.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 899, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water Resources Investigations 78-50, July 1978. 28 p, 6 fig, 2 tab, 22 ref.

Descriptors: *Groundwater availability, *Water quality, *Aquifer characteristics, *Water pollution sources, *Domestic wastes, Septic tanks, Bacteria, Nitrates, Hydrogeology, Groundwater movement, Path of pollutants, Water yield, Data collections, *Colorado, *Southeastern Park County.

Water for domestic use in the Lake George area, Colo., is produced from four aquifers. Two of the aquifers, fractured-cyrstalline and volcanic rocks, have a water table ranging from 10 to 100 feet below land surface and well yields range from 0.08 to 6 gallons per minute. The consolidated sedimentary-rock and unconsolidated-alluvial aquifers have a water table ranging from near land surface to 60 feet below land surface and well yields range from 2 to 50 gallons per minute. The aquifers generally contain calcium bicarbonate water with concentrations of dissolved solids ranging from 101 to 636 milligrams per liter. In some areas, concentrations of iron as much as 18,000 micrograms per liter and concentrations of fluoride as much as 5.6 milligrams per liter affect suitability for domestic use. Chemical degradation of ground water has occurred in 18 of the 35 wells and in the 1 spring that were sampled. Bacterial contamination was found in water from six wells. (Woodard-USGS)
W79-07014

RECOVERY OF VIRUSES FROM THE MISSOURI RIVER,
Environmental Protection Agency Cincinnati, OH.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 865, Price codes: A03 in paper copy, A01 in microfiche. Report 1971. 22 p, 11 tab, 6 ref.

Descriptors: *Municipal wastes, *Water pollution sources, *Viruses, *Public Health, *Rivers, Diseases, Ultimate disposal, Waste water treatment.

Raw influent and effluent samples were collected from primary treatment plants along the Missouri River, and water samples were collected from selected locations along the Missouri River, to evaluate the viral hazard in the Missouri River. A single viable virus excreted by a human is a dangerous pollutant. Viruses were detected along the Missouri River in effluents, midstream, and at water intakes. A midwinter study at St. Joseph indicated that 360,000 viruses/million gallons of water may exist. All viruses identified were polioviruses and echoviruses. There is a need for developing better methodology for the detection of small numbers of viruses in large volumes of water. (Small-FRC)

SELECTED CHEMICAL CHARACTERISTICS OF SOILS, FORAGES, AND DRAINAGE WATER FROM THE SEWAGE FARM SERVING MELBOURNE, AUSTRALIA,
Corps of Engineers, Washington, DC.
R. D. Johnson, R. L. Jones, T. D. Hinesly, and D. J. David.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A019 586, Price codes: A04 in paper copy, A01 in microfiche. January 1974. 54 p, 1 fig, 11 tab, 31 ref. Bound with EPA-430/9-75-017, May 1975.

Descriptors: *Irrigation, *Return flow, *Soil chemical properties, *Forages, *Drainage water, Chemical analysis, Overland flow, Oxidation lagoons, Application methods, Australia, Heavy metals, Trace elements, Sewage treatment, Sewage disposal, Filtration, Waste identification, Waste water treatment, Municipal wastes.

A review of the chemical characteristics of sewage, soils, forage, and drainage water from the Werribee Farm land application municipal waste water treatment system in Melbourne, Australia, was performed by the Army Corps of Engineers. The raw sewage reaching the farm is highly concentrated because of the low water usage in the area and contains about 1,788 ppm total solids, 756 ppm volatile solids, 473 ppm suspended solids, 67.9 ppm total nitrogen, 34.5 ppm total phosphorus, 654 ppm Cl, and 578 ppm BOD. Treatment is provided primarily by land filtration in the summer, with additional treatment provided by overland flow and oxidation ponds; the average flow is about 144 mgd. Soils consist of red-brown silty clay loam, calcerous silty clay, and sand. The study showed soils had increased levels of N, C, and P and higher Ca/Mg ratios; soil K was unchanged or reduced. Total soil contents of all trace elements were increased by waste water irrigation; Zn levels were significantly high. Forage contained increased levels of N, P, K, and Na but reduced amounts of Mn. Drainage waters had lower N and P concentrations than secondary effluents from biological treatment plants and about the same concentration levels of several heavy metals. The treatment farm has been in operation since 1897. (Lisk-FRC)

NUMERICAL SIMULATION OF MIXING IN NATURAL RIVERS,
Stearns and Wheeler, Cazenovia, NY.
T. O. Harden, and H. T. Shen.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY4, Proceedings Paper 14501, p 393-408, April 1979. 7 fig, 25 ref, 2 append.

Descriptors: *Dispersion, *Mixing, *Rivers, *Model studies, Mathematical models, Numerical analysis, Simulation analysis, Water pollution, Water quality, Pollutants, Path of pollutants, On-site investigations, Dye releases, Hydraulics, Environmental engineering.

A numerical model was developed for two-dimensional transient mixing in natural river channels. Through the use of an orthogonal curvilinear coordinate system based on the geometry and the flow distribution of the river channel, the physical domain was mapped into a rectangular strip by introducing the cumulative discharge as the new transverse coordinate. The concentration values at each point in the grid system then were determined at time levels by using a combined implicit/explicit finite difference successive scheme. A computer program was developed to solve these equations, and a case study was presented and verified with an existing steady-state analytical solution and field measurement. (Sims-ISWS)

A beef cattle-pasturing system involving 4 rotationally grazed summer pastures with winter-feeding on one pasture was studied on sloping upland watersheds in Ohio to determine its effect on chemical quality of water. The concentrations of chemicals in runoff from the pastures, which were summer-grazed only, increased relative to that of incoming precipitation but not enough to significantly impair water quality. No measurable sediment was lost from the pastures used only for summer grazing, allowing no chemical movement via that pathway. Much soil and plant-cover disturbance on the pasture used for winter-feeding, however, resulted in increased runoff, some surface erosion, and more chemical movement as compared with the pastures grazed only in summer. Considerably more chemicals moved in subsurface than in surface flow from the summer pastures, while amounts of chemicals transported from the winter-feeding pasture were equally great in surface runoff and subsurface flow. Watershed surface management was a key factor in determining the flow route of water in excess of that used for evapotranspiration and, hence, the pathways and amounts of chemical transport from the pastures. RUNOFF WATER QUALITY AS AFFECTED BY SURFACE-APPLIED DAIRY CATTLE MANURE,
Science and Education Administration, Auburn, AL.
F. L. Long.
Journal of Environmental Quality, Vol. 8, No. 2, p 215-218, April-June 1979. 1 fig, 4 tab, 16 ref.

Descriptors: *Farm wastes, *Waste disposal, *Water quality, Water pollution, Water pollution sources, Biochemical oxygen demand, Chemical oxygen demand, Nitrogen, Nitrates, Grasses, Nutrients, Rainfall, Runoff, Cattle, Drainage, Hydrogen ion concentration, Conductivity, Pollutants, Path of pollutants, Farms, Dairy cattle manure.

The effect of dairy cattle manure on runoff water quality was determined. The manure was surface-applied to Coastal bermudagrass on a Norfolk sandy loam with less than 2% slope at the rate of 45 metric tons/ha per year for 4 years in split applications. Manure applications slightly increased biochemical oxygen demand (BOD) values of runoff water; the maximum value was less than 20 mg/liter and annual mean values were all less than 10 mg/liter with no BOD buildup in the runoff water over the 4-year period. Nitrate levels in runoff water were increased by the manure, but all annual mean values were below critical levels at less than 8 mg NO3-N/liter. During the first 2 years, about 30 kg/ha total N was lost in runoff, but less than 6 kg N/ha was lost during the third and fourth years. (Sims-ISWS)

LAND USE INFLUENCES ON HEAVY METALS IN AN URBAN RESERVOIR SYSTEM,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
D. R. Helsel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 724, Price codes: A11 in paper copy, A01 in microfiche. Ph.D. Dissertation, July, 1978. 61 fig, 46 tab, 160 ref, 2 append. OWRT B-103-VA (2).

Descriptors: *Heavy metals, *Land use, *Stormwater runoff, Urban runoff, Nonpoint pollution, Reservoirs, Urbanization.

Small basins, each of one land-use type, provided stormwater runoff for analysis of copper, chromi-

um, cadium, lead, zinc, iron, and manganese. Atmospheric contributions (precipitation and dustfall), as well as land surface inputs to stormwater, were evaluated. Urban areas were greater yearly producers per acre of lead, zinc, copper, cadium and chromium than are agricultural areas, while producing equivalent amounts of iron, manganese, and suspended solids. Nonpoint inputs to the reservoir were many times greater, on a yearly basis, than metals from the only point source--treated sewage effluent. The majority of metals were found to attach to bottom sediments, remaining behind the dam. Increased upstream urbanization will therefore provide more metals to the reservoir system, but not to the public drinking water intake. Unless an unforeseen mobilization of sediment metals occurs, no public health concern is warranted for metals in the reservor.

POLLUTANT MOVEMENT TO SHALLOW GROUND WATER TABLES FROM ANAEROBIC SWINE WASTE LAGOONS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agronomy.
T. G. Ciravolo, D. C. Martens, D. L. Hallock, E. R. Collins, Jr., and E. T. Kornegay.
Journal of Environmental Quality, Vol. 8, No. 1, p 126-130, January-March 1979. 5 tab, 12 ref. OWRT B-068-VA (2).

Descriptors: *Farm lagoons, *Hogs, *Farm wastes, Virginia, Seepage, Lagoons, Groundwater, Shallow wells, Water pollution sources, Chlorides, Nutrients, Nitrogen compounds, Coliforms, Path of pollutants.

The effect of three anaerovic swine waste lagoons on groundwater quality was investigated in the Atlantic Coastal Plain region. The lagoons studied were located on high-water-table soils with different textures. Groundwater was sampled from wells, with unperforated casings, located at depths to 6 m and distances to 30 m from the lagoons. These samples were taken monthly from September 1974 through January 1975, and bimonthly thereafter through November 1975. Groundwater also was sampled in November 1975 from shallow wells, with perforated casings, located at distances to 36.6 m from 2 of the 3 lagoons. Constituents determined to investigate groundwater contamination were density of fecal coliforms and concentrations of Cl, Cu, Mn, NH4-N, NO3-N, PO4-P, and Zn. Chloride, NH4-N, and NO3-N concentrations in groundwater samples indicated that seepage entered groundwater from each of the 3 lagoons. Rupture of lagoon seals leading to seepage was attributed to drying of exposed subsoil or embankment soil during recession of lagoon liquid levels and to gas release from microbial activity in soil beneath the seal. (Sims-ISWS)

TRANSFRONTIER POLLUTION: PLAINTIFF CAN CHOOSE HIS COURT,
A. Rest.
Environmental Policy and Law, Vol. 3, No. 1, p 41-46, March 1977.

Descriptors: *Jurisdiction, *International law, *Environmental control, Pollutants, Europe, Adjudication procedure, Judicial decisions, Damages, Legal aspects, Interstate compacts.

One of the major problems in the field of environmental protection is the prevention of transfrontier environmental injuries. In a highly industrialized society, the infringement of individual rights caused by environmental damage is not likely to be totally eliminated. This has created a need for a satisfactory solution concerning a way to sue for compensation. It is the jurisdictional aspect of this problem which creates the most significant problems. 'Forum delicti' competence, which is provided for in European states as a distinct place of jurisdiction, is not precise enough and can lead to uncertainty. A definition of the 'forum delicti' was finally announced by the Court of Justice of the European communities on Nov. 30, 1976. The court held that the 'forum delicti commisi' in transfrontier pollution cases meant the place where the tortfeasor began to act as well as the place where the injurious result occurred. The decision explicitly states that the plaintiff has the right to sue in either of these places. (Goldberg-Florida)

Descriptors: *Baseline studies, *Water pollution effects, *Zooplankton, *Sediments, Environmental effects, Resources development, Texas, *Outer Continental Shelf, *Hydrocarbons, Petrogenic hydrocarbons, Biogenic hydrocarbons, Petroleum development, South Texas Outer Continental Shelf(STOCS).

An extensive survey of the level of natural and petroleum type hydrocarbons in seawater, zooplankton and sediment from the South Texas Outer Continental Shelf (STOCS) was made. The presence or absence of indicator parameters, including n-paraffins, odd-even ratios, unresolved GLC humps, and GC/MS confirmation of aromatic hydrocarbons, were taken as a measure of petroleum contamination. Some Zooplankton samples showed contamination with petroleum-like hydrocarbons. Dissolved and particulate hydrocarbons in seawater were determined in 56 samples. Hydrocarbon analyses of 15 sediment samples from the open shelf showed that the sedimentary environment was still a pristine one. No gross contamination of sediments with petroleum-like hydrocarbons has been observed. Total organic carbon content increased with increasing distance from shore, probably reflecting the increasing clay content of the sediments. Stable carbon isotope distributions were fairly uniform throughout the STOCS area. A possible trend of more positive Delta C13 values shoreward may have been due to inclusion of estuarine derived organic matter (seagrasses) in these sediments. (See also W79-07287) (Sinha-OEIS)

Descriptors: *Baseline studies, *Water pollution sources, *Water pollution effects, *Biota, Environmental effects, Texas, Oil pollution, Fishes, Shellfish, *Outer Continental Shelf, *Hydrocarbons, Petrogenic hydrocarbons, Biogenic hydrocarbons, Petroleum development, Oil transport, South Texas Outer Continental Shelf(STOCS).

A total of 207 samples of benthic macroepifauna and macronekton from the South Texas Outer Continental Shelf (STOCS) was analyzed for heavy-molecular-weight hydrocarbons. These analyses included samples of muscle, liver, and gonads. Five (5) large samples, 36 intraspecific variability samples and 3 ship's contaminant samples were also analyzed. The samples generally had very low levels of total hydrocarbons, averaging 2 ppm or less, with C15 and C17 alkanes and pristane predominating. The aliphatic hydrocarbon distribution and the very low levels of phytane and aromatic hydrocarbons (generally 0.01 ppm or less) detected were suggestive of biogenic origins for the hydrocarbons in the samples analyzed. The absence of correlations in the pristane/phytane, pristane/C17, phytant/C18 and CPI14-20 ratios also implied the absence of significant levels of petroleum in the organisms analyzed. The hydrocarbons detected in biota were of mainly biogenic origin. Occasionally, some evidence of hydrocarbons of petroleum origin were found, but the levels were very low suggesting very little contamination of the study area. The hydrocarbon profiles for a large number of species were obtained. These profiles provided a wide data base for determining the

effects of petroleum exploration and production on the hydrocarbon content of biota from the STOCS. (See also W79-07287) (Sinha-OEIS)

TRACE METALS IN EPIFAUNA, ZOOPLANKTON AND MACRONEKTON,
Texas A and M Univ., College Station. Dept. of Oceanography.
B. J. Presley, P. N. Boothe, D. Baranowski, and S. Schofield.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol. I,' p 6-1 - 6-47, January 15, 1979. 8 tab, 9 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Water pollution sources, *Heavy metals, *Metals, *Zooplankton, Water pollution effects, Environmental effects, Texas, Fishes, Shellfish, *Outer Continental Shelf, Trace metals, South Texas Outer Continental Shelf(STOCS).

Concentrations of 10 metals (Al, Ca, Cd, Cr, Cu, Fe, Ni, Pb, V, Zn) were determined in 340 samples including: zooplankton; muscle tissue from fish and shrimp; fish gill and liver tissue; and shrimp hepatopancreas. Concentrations were determined by flame atomic absorption spectroscopy (AAS) (Cu, Fe, Zn), flameless AAS (Cd, Cr, Ni, Pb) and neutron activation analysis (Al, Ca, V). No indication of substantial heavy metal pollution was observed. The amount of variability in trace metal concentrations among the major sample groups in 1977 was similar to that observed in 1976. For zooplankton sampled, Pb concentrations decreased offshore, and Cd levels showed the reverse trend. The levels of all metals except Cd were highest in the fall season. Fish and shrimp muscle had generally low, uniform trace metal levels with few apparent geographical, seasonal or interspecific differences. Fish species in order of decreasing total content of trace metals were Rhomboplites aurorubens, Stenotomus caprinus, Pristipomoides aquilonaris, Lutjanus campechanus, and Serranus atrobranchus. Both species of shrimp analyzed had similar levels of trace metals in their hepatopancreatic tissue. This tissue contained the highest Ni levels of any sample type analyzed. Cadmium levels were similar to those in fish livers. Cadmium and Ni levels were maximal in the winter season. No consistent geographic trends were apparent. (See also W79-07287) (Sinha-OEIS)

ACID RAIN: NEUTRALIZATION WITHIN THE HUBBARD BROOK ECOSYSTEM AND REGIONAL IMPLICATIONS,
Dartmouth Coll., Hanover, NH. Dept. of Earth Sciences.
N. M. Johnson.
Science, Vol. 204, No. 4392, p 497-499, May 4, 1979. 2 fig, 1 tab, 16 ref.

Descriptors: *New England, *New Hampshire, *Precipitation(Atmospheric), *On-site investigations, *Watersheds(Basins), *Fallout, Pollutants, Acids, Acidity, On-site data collections, Water quality, Hydrogen ion concentration, Acidic water, Aluminum, Silica, Water analysis, Streams, Neutralization, Acid rain.

The purpose was to describe and explain the process by which acid rain is transformed into chemically normal stream water. The chemical character of a small stream, Falls Brook, has been monitored over a 3-year period. Nine sites along this drainage network have been sampled on a monthly basis over three annual cycles. Water samples were collected and chemically analyzed. The chemical data from Falls Brook show that the neutralization of acid rain is rapidly and largely (about 75%) accomplished in the upper soil or regolith by the dissolution of preexisting aluminum hydroxide compounds and by the leaching of bases from various biologic materials. On a regional basis, acidified and aluminum-rich lakes and streams in New England are confined mainly to low-order watersheds. (Humphreys-ISWS)

THE SIGNIFICANCE OF SEWAGE EFFLUENT FOR THE HYDRAULIC AND NUTRIENT LOADS ON LAKES,
National Swedish Environmental Protection Board, Uppsala (Sweden). Inst. of Physiological Botany.
S-O. Ryding.
Progress in Water Technology, Vol. 10, No. 6, p 907-916, 1978. 4 fig, 2 tab, 23 ref.

Descriptors: *Storm runoff, *Sewage effluents, *Nutrients, *Lakes, Waste water treatment, Water pollution, Water pollution sources, Pollutants, Path of pollutants, Sampling, Ammonia, Nitrogen, Nitrates, Nitrites, Phosphorus, Phosphates, Organic matter, Water quality, *Sweden.

Studies of hydraulic and nutrient loads as natural and municipal (sewage effluent) input to wastewater receiving lakes were carried out in 8 drainage basins. Results from two drainage basins, quite different with regard to human activities, were presented in more detail. The results could be summarized in the following way: (1) sewage effluent quality showed great variations; (2) ammonia and nitrite+nitrate concentrations showed an opposite variation pattern in sewage effluent; (3) sewage effluent was the dominant source of ammonia; (4) sewage effluent played a minor role for the hydraulic load and as a source of organic matter; (5) the relative phosphate load from sewage effluent (compared with the total phosphate load on the lakes) exceeded the relative load of total phosphorus from the plant--this was valid in areas not too influenced by man; and (6) the role of sewage effluent as a nutrient source was enhanced during the vegetation period. An indirect method of estimating urban stormwater runoff and overflow loads and concentrations from combined sewer systems was presented. A mathematical framework consisting of mass and flow balances for the sewer system and its attendant treatment plant was used with treatment plant sampling data and rainfall data as input. The mass balance was applied to the drainage area of the 26th Ward Water Pollution Control Plant in Brooklyn, New York, which drains to Jamaica Bay. Data from this plant on suspended solids, volatile suspended solids and total and soluble BOD were available for the period 1945-1975, and 7 of these years (1951, 54, 57, 60, 66, 69) were analyzed in depth. Mean annual values of load and concentration for these constitutents were compared with others' directly sampled runoff and overflow data. Sensitivity of model results to variations in several input parameters was checked. The approach was suggested as an economical and accurate alternative to sampling programs or presently available deterministic runoff quality mathematic models for areawide assessment over a long time scale. SOURCES AND CONCENTRATIONS OF NITRATE-NITROGEN IN GROUND WATER OF THE CENTRAL PLATTE REGION, NEBRASKA,
Nebraska Univ., Lincoln. Div. of Conservation and Survey.
J. R. Gormly, and R. F. Spalding.
Ground Water, Vol. 17, No. 3, p 291-301, May-June 1979. 8 fig, 3 tab, 45 ref.

Descriptors: *Nitrogen, *Nebraska, *Nitrates, *Groundwater, *Water pollution sources, Fertilizers, Farm wastes, Pollutants, Path of pollutants, Denitrification, Soils, Organic matter, Feed lots, Water wells, Isotope studies, Water pollution, Agriculture, *Buffalo County(NB), *Hall County(NB), *Merrick County(NB).

During 1976-77, nitrate-nitrogen (NO3-N) concentrations exceeded 10 mg/l in 183 of the 256 groundwater samples collected from parts of Buffalo, Hall, and Merrick Counties in Nebraska. Comparison of the isotopic values with those of potential nitrate sources suggested that the primary source of contamination in most wells was fertilizer and that a small percentage of the wells contained significant concentrations of NO3-N derived from animal wastes. A combination of two or more sources of contamination was assumed for those samples for which the source could not be identified. Significant negative correlations between delta 15N and NO3-N (-0.35 in Buffalo and Hall Counties) and between delta 15N and depth to water (-0.55 in Merrick County) indicate that denitrification is the major factor in isotopic fractionation of nitrogen from the nitrate source. LEVELS OF AMMONIUM, SULFATE, CHLORIDE, CALCIUM, AND SODIUM IN SNOW AND ICE FROM SOUTHERN GREENLAND,
State Univ. of New York at Buffalo, Amherst. Ice Core Lab.
E. Busenberg, and C. C. Langway, Jr.
Journal of Geophysical Research, Vol. 84, No. C4, p 1705-1709, April 20, 1979. 5 fig, 3 tab, 28 ref.

Descriptors: *Snow, *Ice, *Pollutants, *Data collections, Chemical analysis, Sulfates, Chlorides, Calcium, Sodium, Cations, Analysis, Variability, *Greenland, Ammonium.

Chemical analysis of surface snows and dated ice core samples from Dye 3, Greenland, suggests that the ammonium cation is a major constituent in all samples and that the annual ammonium levels present in the south Greenland samples have varied from 3.3 to 26.3 microgram/kg between the seventeenth century and the present time. The annual range of 1974-1975 surface samples was between 3.8 and 8.8 microgram/kg, while the mean was 5.7 + or - 1.8 microgram/kg. The recent large-scale uses of fixed nitrogen fertilizers and industrial pollution have apparently not affected the levels of ammonia reaching southern Greenland. The sodium and chloride present are predominantly derived from ocean spray, while more than 90% of the calcium is of continental origin. The levels of these 3 elements apparently have not been affected by human activity since the industrial revolution. Sulfate levels have increased dramatically since the industrial revolution, suggesting that sulfate of antropogenic origin is the most important source of sulfate in modern snows from southern Greenland. The amount of the sulfuric acid neutralized by the ammonium cations was approximately 100% in the 17th and 18th centuries, dropping to approximately

20% in the 1974-1975 samples. These figures imply that there has been an increase in the acidity of precipitation in southern Greenland since the end of the 18th century. (Humphreys-ISWS)

Descriptors: *Water pollution sources, *Organic compounds, *Pennsylvania, *Tidal streams, *Delaware River, On-site investigations, Pollutants, Sampling, Monitoring, Chemical analysis, Water quality, Analytical techniques, Testing, Methodology, Chromatography, Spectrophotometry, Data collections, Phenols, *Philadelphia(PA), Chlorinated compounds, Plasticizers, Ethylene glycol derivatives.

The transport of industrial organic chemicals from their source, into the Delaware River, through various treatment facilities, and into Philadelphia's finished drinking water was studied using water samples collected in August 1977. Solvent extraction, liquid chromatographic cleanup, and chromatographic mass spectrometry were used for compound separation and identification. Results confirmed discharge sources for many previously identified compounds. Furthermore, it was shown that many of these compounds circulated into Philadelphia's drinking water, and that the various water and waste treatment facilities had a minimal effect on the organic levels. For all chemicals, dilution processes were responsible for the largest reduction in organic concentrations. Results were substantiated by a 10-week sampling program designed to monitor 7 selected waste chemicals. (Humphreys-ISWS)

Descriptors: *Lake Superior, *Pollutants, *Polychlorinated biphenyls, *Fallout, *Great Lakes, *Canada, Sediments, Cores, Sampling, Sedimentation rates, Analysis, Analytical techniques, Testing, Methodology, Lakes, Water pollution sources, On-site investigations, Data collections, *Thunder Bay(Ontario), *Keweenaw Peninsula(Ontario), Surficial sediments.

Sediment cores were obtained from Lake Superior by means of an oceanographic box corer and analyzed for polychlorinated biphenyls (PCBs). Concentration of PCBs in the top 0.5 cm averaged 0.17 + or - 0.13 microgram/g of sediment on a lakewide basis. The maximum PCB concentrations were found in surficial sediments between the Keweenaw Peninsula and Thunder Bay in the prevailing downwind direction of Thunder Bay, Ontario. Depth-fractionated sediments yielded no detectable PCBs at depths greater than 3 cm below the sediment-water interface, and they often were not detected below a burial depth of 1 cm. The depth of sediment turbation by biotic or physical processes appears to be less than 1 cm. PCB input to Lake Superior from the atmosphere (dry, wet, gaseous) is estimated as 3-8 million g/yr, and can account for sedimentary PCB concentrations. The PCB sedimentation rate in Lake Superior is estimated as approximately 0.3-0.4 microgram/sq m/yr. The results of this study suggest that atmospheric transport and deposition may dominate PCB input to the Lake Superior ecosystem. (Humphreys-ISWS)

MIREX AND THE CIRCULATION OF LAKE ONTARIO,
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
R. L. Picket, and D. A. Dossett.
Journal of Physical Oceanography, Vol. 9, No. 2, p 441-445, March 1979. 5 fig, 8 ref.

Descriptors: *Path of pollutants, *Great Lakes, *Lake Ontario, *Water circulation, *Model studies, Mathematical models, Circulation, Currents(Water), Sediments, Lake sediments, Bottom sediments, Deposition(Sediments), Pollutants, Water pollution, Water quality, Lakes, Limnology, Mirex.

The observed pattern of mirex in Lake Ontario's sediments is consistent with what is known about the Lake's long-term circulation. A reasonable simulation of the mirex pattern was obtained using a steady-state circulation model coupled to a simple water quality model. The equivalent 10-year mirex accumulation on the lake bottom from these numerical models is similar to the observed mirex pattern. (Sims-ISWS)

BIOLOGICAL RELEASE AND RECYCLING OF TOXIC METALS FROM LAKE AND RIVER SEDIMENTS,
Australian National Univ., Canberra. Dept. of Zoology.
W. L. Nicholas, and M. Thomas.
Australian Water Resources Council Technical Paper No. 33, 1978. 111 p, 20 fig, 43 tab, 40 ref, 4 append. 74/69.

Descriptors: *Heavy metals, *Water pollution sources, *Mine wastes, *Zinc, *Water pollution effects, Environmental effects, Animal physiology, Plant tissues, Sediments, Riverbeds, Copper, Lead, Pyrite, Chromium, Cobalt, Manganese, Nickel, Iron, Molonglo River(New South Wales Australia).

Heavy metal wastes from the abandoned Lake George Mines have polluted the Molonglo River below Captain's Flat in New South Wales. The flora and fauna of the river are severely depleted for many kilometers, and in 1975 the riverbed was lifeless immediately below Captain's Flat. The rich flora and fauna existing 30 km downstream from Captain's Flat are influenced by the pollution. Although recent civil engineering work is expected to prevent further pollution of the river from the abandoned mines, it will not reduce the pollutants already present in the river. Chemical analyses of plants and animals living in the river below the most polluted section of the river and bottom sediments from the riverbed show that zinc, the major pollutant, is present in great quantities in the river system and in plant and animal tissues. The very high concentrations of zinc were firmly bound by organic detritus, which retains the capacity to bind more zinc of the pH of the river water as long as the zinc remains in the water. Bull rushes and willows absorb zinc from the river sediments, and the dead leaves continue to adsorb zinc until they disintegrate. Microorganisms also absorb zinc from the river and retain it in zinc-free water. Invertebrates feeding on the microorganisms and detritus ingest zinc, retain some in their tissues, and excrete much of it, thus releasing it into the river. Plants growing in the river take up zinc from the sediments and recycle it in their decomposing remains, either in situ, on land, or downstream. (Davison-IPA)

BENEFITS AND COST OF SEASONAL EFFLUENT PERMITS IN NORTH CAROLINA,
North Carolina State Univ. at Raleigh. Dept. of Economics and Business.
D. Hargett, and J. A. Seagraves.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 147, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Institute University of North Carolina Report No. 135, January 1979. 41 p, 5 tab, 3 append. OWRT A-101-NC(1). 14-34-0001-8035.

Descriptors: *Costs, *Benefits, *Effluent permits, Dissolved oxygen, North Carolina, Social benefits, Water quality standards.

In the winter the capacity of North Carolina streams to assimilate oxygen-demanding wastes increases due to higher dissolved oxygen saturation levels and increased streamflows. Waste treatment plants are designed to meet water quality standards which are based on summer conditions when waste assimilative capacities are lowest due to high temperatures and reduced flows. The seasonal effluent permits proposed by the North Carolina Department of Natural Resources and Community Development would allow up to a doubling of the discharge of BOD wastes for the most severely restricted discharges during the months November through March. These winter-summer permits could result in large benefits to the State of North Carolina (a rough estimate of the savings in waste treatment costs is $2.9 million per year). No quantifiable social costs (negative effects on the environment, health, or production), and practically no additional administrative costs were found. It is suggested that it might be appropriate to schedule hearings on the proposed changes in regulations. (Kiger-North Carolina)

WATER QUALITY DEGRADATION DUE TO NON-POINT POLLUTION INPUT FROM URBAN SOURCES,
Delaware Univ., Newark. Dept. of Civil Engineering.
J. B. Carberry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 182, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Center, Delaware University, Research Project Technical Completion Report, January 1979. 97 p, 51 fig, 19 tab, 75 ref, 1 append. OWRT B-012-DEL(1).

Descriptors: *Water quality, *Water pollution, *Water pollution sources, *Path of pollutants, *Lead, *Cadmium, *Urban drainage, Urban runoff, Urban hydrology, Storm runoff, Rainfall, Impact(Rainfall), Sampling, Christiana River(Newark, Delaware).

Dry and wet weather samples were collected from five stations on the Christiana River in Newark, Delaware, and analyzed for cadmium and lead to determine the impact of urban runoff on stream water quality. Each station depicted a different degree of urbanization, and the stations characterized by urban upstream reaches showed the greatest variation between wet and dry weather stream water quality. Regression analysis was used to relate stream water quality to the following hydrological variables in each reach: flowrate, total antecedent rainfall, time from storm start, and antecedent dry period preceding the last storm. Lead concentrates in stream samples were directly related to flowrate for all stations sampled, and mass flux of lead increased with flow rate. This confirmed that inputs of lead continued to the River during storm events. The mass influx of cadmium was reduced at large flowrates indicating less impact of non-point sources of cadmium than for lead. Cadmium and lead concentrations in stream

samples were related to the amount of antecedent rainfall subsequent to sample collection. The agreement found for 24 or 48 hour antecedent periods suggested that non-point inputs of these metals affected stream water quality for periods of 48 hours or less. Longer term impacts of urbanization on River quality were confirmed when concentrations of lead remained elevated for up to 48 hours several miles below the urban area. The highest average concentrations of lead for wet and dry periods found at urban upstream reaches confirmed the relationship between urbanization and stream quality degradation within this study area. SIMULATION VERSUS A PROBABALISTIC APPROACH FOR EVALUATING STORM-WATER TREATMENT ALTERNATIVES,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
W. A. Melville, and J. M. Bell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 194, Price codes: A07 in paper copy, A01 in microfiche. Technical Report No. 105, June 1979. 133 p, 44 fig, 40 tab, 15 ref, 3 append. OWRT C-6106(5213)(9).

Descriptors: Urban runoff, Unit hydrograph, Peak discharge, Rainfall, Precipitation excess, Detention storage, *Stormwater management, *Suburban watersheds, Pollutograph, ILLUDAS, STORM, Kolmogorov-Smirnov tests.

The intent of the report is to demonstrate the applicability of the stormwater management model STORM as a planning tool for water quality control of suburban watersheds. In the development of the analysis several minor objectives were also met. The first was the development of a methodology to calibrate STORM using magnitude of pollutant washoff and pollutograph profile comparison via the Kolmogorov-Smirnov statistic. This methodology proved effective in demonstrating the superior predictability of suspended solids over BOD5. A significant finding was the development of a methodology to estimate the percent of pollutant overflow for a given storage level without the need of computer simulation. A storage utilization curve derived from the rainfall mass curve was found to be indicative of the storage utilization for pollutant removal. This method compared favorably with the STORM predictions. A comparison of a global economic analysis revealed that four to five overflows per year is optimal economically. Also these values coincide with the optimal pollutant removal, where the storage of an equivalent of a one inch event with a treatment rate of 0.01 - 0.02 runoff inches per hour would be more than sufficient for the watersheds studied.

URBAN STORM WATER POLLUTANT SOURCES,
Chaumers Univ. of Technology, Goteborg (Sweden). Dept. of Water Supply and Sewerage.
P. A. Malmquist, and G. Svensson.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 31-38, 1977. 1 fig, 12 tab, 6 ref.

Descriptors: *Urban hydrology, *Storm water, *Effects, *Pollutant sources, *Water quality, Corrosion, Population, Zinc, Copper, Lead, Suspended solids, Rainfall, Runoff, Air, Monthly, Evaluation, Regression analysis, Mathematical models, Systems analysis, Traffic, Atmospheric fallout, Building materials, Street sweeping, Mass flows, Refuse incineration, Catchments, Goteborg(Sweden).

Four urban and suburban areas in Goteborg have been investigated with respect to storm water quality and its sources of pollution. The sources studied were primarily atmospheric fallout and the corrosion of building materials, but traffic and population were also considered. The mass flows of zinc and copper in the storm water proved to be caused by fallout and corrosion. Lead could, as expected, be explained by the traffic. The frequency and effectiveness of street sweeping are important to the lead content in the storm water. The mass flows of suspended solids, COD, and phosphorus may be correlated to traffic and population, but phosphorus also was proved to originate from fallout. Point sources like a refuse incineration plant in one of the areas markedly increased the concentrations of pollutants in the storm water. The results of this investigation will be used to develop an entirely new type of storm water quality model, based on the pollutant sources. (See also W79-07426) (Bell Graf-Cornell)

EFFECTS OF URBANIZATION ON PHOSPHORUS FLOWS IN A RESIDENTIAL SYSTEM,
Nova Scotia Technical Coll., Halifax.
D. H. Waller.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 52-58, 1977. 3 fig, 1 tab, 20 ref.

Descriptors: *Effects, *Urbanization, *Phosphorus, *Flow, *Water quality, *Stormwater runoff, *Water balance, *Residential system, Annual, Nutrients, Ecosystems, Precipitation, Evapotranspiration, Sewage, Estimating, Vegetation, Systems analysis, Mathematical models, Atmosphere.

A model represents, on an annual basis, water and nutrient flows into and through a residential system. Changing model parameters to represent alternative development patterns helps to illustrate the dramatic effects of urbanization on nutrient flows. Analysis of sources and magnitudes of phosphorus discharges from a 1-ha residential area suggests that vegetation is the principal source of phosphorus, and that explicit consideration of individual sources may be a useful approach to prediction of phosphorus loads from urban areas. WATER BUDGET FOR A HOUSING AREA IN GOTEBORG,
Chalmers Univ. of Technology, Goteborg (Sweden). Dept. of Water Supply and Sewerage.
P-A. Malmquist, and G. Svensson.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 101-108, 1977. 4 fig, 7 tab, 3 ref.

Descriptors: *Water budget, *Sewer systems, *Flow, *Water quality, *Water quantity, *Goteborg area(Sweden), Measurement, Rainfall-runoff relationships, Storm water, Pollutants, Drainage water, Storage capacity, Surface waters, Consumption water, Housing area.

Torslanda, a suburban area, located in the Goteborg area on the west coast of Sweden, was investigated with respect to the functioning of sewer systems. Both quantity and quality were considered. Based on measurements of rainfall, drinking water consumption, sewage and storm water flow, a water budget was calculated. A distinction was made between drainage water, sewage and storm water in the separate sewer system. In this area, it was found that the drainage water flow range is 0.4-1.5 times the average sewage flow. During rainfall the sewer takes up to 30 percent of the total runoff volume, and the maximum leakage flow is 5 times the average sewage flow. Thus the separate sewer system does not perform very well with respect to quantity. The mass flows of SS, BOD, P, and Pb were calculated, and it was found that the mass flows of pollutants were less than for a combined sewer system. The mass flows of pollutants were, however, nearly of the same magnitude as those of a combined system with storage capacity. (See also W79-07426) (Bell Graf-Cornell)

SOURCES OF EUTROPHICATION IN THE WESTERN NETHERLANDS AS ILLUSTRATED FOR THREE POLDERS,
Institute for Land and Water Management Research, Wageningen (Netherlands).
J. H. A. M. Steenvoorden.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality, Proceedings of the Amsterdam Symposium, October 1977. p 344-350, 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Science, 1 fig, 5 tab, 12 ref.

Descriptors: *Eutrophication, *Netherlands, *Polders, *Water pollution, Nitrogen, Phosphorus, Soils, Water balance, Equations, Effects, Mineral balance.

For three polders in the Western Netherlands, the contribution to the nitrogen and phosphorus loads from different sources of pollution was calculated. The fact that the land surface is below sea level and that heavy soil layers of eutrophic brackish peat are present cause a very high load of nitrogen and phosphorus. Horticultural use of the soils leads to a considerable additional loss of nitrogen compared with grassland. In quantitative terms, the most important contributors are: input of water from the River Rhine and incidental seepage, private gas wells, natural leaching of the peaty soil, and use of fertilizers in the horticultural areas. In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amerstdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 358-364, 1977. 1 fig, 6 ref.

Descriptors: *Forecasting, *Water bodies, *Urban, *Pollutant entry, Reliability, Water quality, Waste water(Pollution), Runoff, Methodology.

Forecasting water quality consists conventionally of two stages: (1) studying and assessing the influence of external factors on the processes affecting the quality of water; and (2) forecasting the quality of water in the water bodies for various calculation ranges. Discussed herein is predicting the amount of pollutants brought to surface-water bodies in urban areas by municipal and industrial waste water and overload flow from the area of cities. It is concluded that this is a very complex and many-faceted task; coping with the job means elaborating several scientific-technical and technological forecasts. The reliability of a pollution forecast depends to a considerable degree on the accuracy of intermediate forecasts, as well as on the dependability of input data. MOBILITY OF POLLUTANTS IN SOIL AND GROUNDWATER NEAR WASTE DISPOSAL SITES,
Institute for Land and Water Management Research, Wageningen (Netherlands).
J. Hoeks.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 380-388, 1977. 6 fig, 1 tab, 12 ref.

Descriptors: *Groundwater, *Soils, *Pollutants, *Mobility, Waste disposal, Sites, Leachate, Equations, Chemical processes, Biochemical processes, Waste tips.

A considerable amount (50 to 60 per cent) of municipal refuse is dumped in or on the soil in the Netherlands. In the humid climate, the soluble components of the dumped refuse are leached into the underlying soil and groundwater. Leachate from a waste disposal site is a seriously polluted waste water. The flow path of these pollutants in soil is governed by the flow path of the carrier, i.e. water. This means that hydrogeological parameters determine the pathway of the pollutants through the groundwater towards the surface water. The mobility of the pollutants in soil largely depends on processes like cation exchange, chemical solubility equilibria and biochemical reactions. Cation exchange processes play an important role with respect to inorganic cations including heavy metals. Phosphates, carbonates and sulphides of iron, aluminum, calcium, magnesium and heavy metals are involved in chemical processes. Biochemical processes are important with respect to nitrogen compounds and organic substances. Information about the rate of these reactions is needed for predicting the mobility of different pollutants in the soil. To a certain extent, control of pollution is possible, e.g. by carefully selecting the sites for waste disposal, by controlling the infiltration of water into the dumped refuse and, if necessary, by collecting and treating the polluted leachate. WATER QUALITY MODELS FOR WASTE WATER MANAGEMENT,
Australian National Univ., Canberra. Centre for Resource and Environmental Studies.
P. G. Whitehead.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 421-430, 1977. 6 fig, 12 ref.

Descriptors: *Water quality, *Model studies, *Waste water(Pollution), *Management, *Methodology, Evaluation, Effects, Effluents, Aquatic environment, Planning, Behavior, Time series analysis, Algorithms, Artificial aeration, Cam River(GB), Mass balance, Equations, Stochastic processes, Monte Carlo method, Simulation analysis, Systems analysis.

A methodology is proposed for evaluating the impact of effluent on the aquatic environment and for the development of management strategies for the planning and control of waste water systems. The particular approach considers the dynamic behavior of the river system and relates time varying upstream influents to downstream water quality using simple, low order but robust models of water quality. Identification and estimation problems are investigated using recursive algorithms of time series analysis, and practical applications are considered for an artificial aeration scheme on the River Cam and a probabilistic assessment of the impact of effluent from the new town of Milton Keynes in the United Kingdom. 5C. Effects Of Pollution

ECOLOGICAL ASSESSMENTS FOR WASTEWATER MANAGEMENT IN SOUTHEASTERN MICHIGAN,
Michigan State Univ., East Lansing. Inst. of Water Research.
T. G. Bahr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 121, Price codes: A19 in paper copy, A01 in microfiche. Report, 1972. 438 p, 32 fig, 55 tab, 437 ref, 2 append.

Descriptors: *Biological treatment, *Tertiary treatment, *Land management, *Michigan, *Lake Erie, Environmental effects, Ecosystems, Tributaries, River systems, Water quality control, Waste water treatment, Municipal wastes.

Detailed ecological consequences of advanced biological waste treatment, physical-chemical treatment, land disposal of wastes, and combinations of these treatments are described for Southern Michigan. To assist in the evaluation of waste management alternatives, an assessment methodology was developed and incorporated the assessment of depletion of potentially limiting resource reserves and the assessment of the impacts of energy utilization for a given waste water management alternative. The impacted areas studied were the sites for land disposal, the southeastern Michigan tributary system, and the Lake Erie system. Pollutants considered in the ecological evaluation included a variety of pesticides and other organic compounds, and heavy metals. The ecosystems of the impacted areas were also discussed. Phosphorus was identified as the primary pollutant affecting Lake Erie and phosphorus control was recommended. Improved methods of municipal and industrial waste water treatment would also improve the water quality of the tributary streams, especially in the area of outfalls. Appendices include a listing of heavy metals in southeastern Michigan and an evaluation of the impact of waste water on soils. (Lisk-FIRL)

LARVAL EXCLUSION SYSTEMS FOR POWER PLANT COOLING WATER INTAKES.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-291 024, Price codes: A11 in paper copy, A01 in microfiche. Proceedings of the Workshop held at San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. Sharma, R.K., and Palmer, J.B., (Eds.). 1978, 235 p. Argonne National Laboratory, Argonne, Illinois. DOE W-31-109-Eng-38.

Descriptors: *Environmental effects, *Entrainment, Fish, Larvae, Powerplants, Intakes, Cooling water, Design, *Impingement.

This workshop was cosponsored by Argonne National Laboratory, Electric Power Research Institute, and Southern California Edison Company. The objective of the workshop was to evaluate the status of various methods for prevention of larval fish entrainment. Concepts covered include: artificial filter beds; subsurface collectors; porous dikes; fine-mesh screens; perforated pipes; single-entrance, double-exit screens; and profile-wire screens. Nineteen papers are presented as well as a synthesis section. For most concepts, it was concluded that the demonstration of engineering feasibility is farther ahead than the demonstration of biological effectiveness. In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diefo, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 51-63, 1978. 6 fig, 1 tab, 22 ref.

Descriptors: *Environmental effects, *Engineering structures, *Entrainment, Filters, Aquatic life, Laboratory tests, On-site investigations, Intakes, Porous-dikes.

The porous dike being considered as a possible means of larval exclusion at power plant cooling water intakes resembles a breakwater but has a cobble or gravel core which allows relatively free passage of water while presenting a physical and behavioral barrier to aquatic organisms. Laboratory results and field observations suggest that avoidance by both larvae and post-larvae is likely, but design methods to maximize avoidance are not yet available. Fouling growth is a potential problem which has been avoided at existing dikes by the use of large filter materials. Methods are not yet available to predict flow restriction due to fouling. A three-year program of field experiments on a pilot-scale porous-dike is proposed to determine biological effectiveness. (See also W79-07080) (Chilton-ORNL)

INVESTIGATION ON THE PROTECTION OF FISH LARVAE AT WATER INTAKES USING FINE-MESH SCREENING IMPINGEMENT-RELEASE CONCEPT: LABORATORY STUDY OF A SINGLE-ENTRANCE, DOUBLE-EXIT, VERTICAL TRAVELING SCREEN CONCEPT,
Tennessee Valley Authority, Chattanooga.
S. H. Magliente, D. A. Tomljanovich, J. H. Heuer, S. Vigander, and M. N. Smith.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 69-77, 1978. 6 fig, 4 ref.

Descriptors: *Environmental effects, *Engineering structures, *Entrainment, Aquatic life, Intakes, Cooling water, Powerplants, Mortality, Filters, Screens, Larvae, *Impingement, Impingement-release.

The single-entry, double-exit vertical traveling screen which is described exhibits desirable characteristics for safe handling of fish and is amenable to design modification. The larval fish testing program underway will progress from an evaluation of fish survival on a basic screen with few modifications (worst case) to an evaluation of survival on a screen with several fish protection modifications. Upon completion of testing, survival of fish exposed to the entire impingement and transfer process will be compared to survival of fish exposed to impingement alone. Importance of stresses critical to larval survival will be investigated in the laboratory. (See also W79-07080) (Chilton-ORNL)

SURVIVAL OF DOMINANT ESTUARINE ORGANISMS IMPINGED ON FINE-MESH TRAVELING SCREENS AT THE BARNEY M. DAVIS POWER STATION,
Central Power and Light Co., Corpus Christi, TX.
L. S. Murray, and T. S. Jinnette.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 79-87, 1978. 3 fig, 3 tab, 5 ref.

Descriptors: *Environmental effects, *Engineering structures, *Entrainment, Marine animals, Estuaries, Intakes, Cooling water, Powerplants, Mortality, *Impingement.

The purpose of this study was to describe survival of marine organisms impinged on Passavant fine-mesh center-flow traveling screens and to examine the influence of debris loading on survival of selected dominant species. During the twelve month study, overall percent survival of all organisms was 86%. Five species (Brevoortia patronus, Anchoa mitchilli, Micropogon undulatus, Penaeus aztecus, and Lucania parva) represented 80% of the total number and the fragile forms (Anchoa mitchilli and Brevoortia patronus) represented 58% of the total. Monthly catches were highly variable with the greatest numbers of dominant species collected from February through May and the fewest collected from June through December. Atlantic croaker and brown shrimp incurred only a 3% mortality while rainwater killifish and bay anchovy incurred the highest mortality at 31%. Some correlation was noted between debris loading and mortality during the study but it was concluded that mortality was increased more by the occurrence of jellyfish than any other factor. W79-07089

CURRENT TVA WORK ON THE FLUID MECHANICS OF SCREENS WITH VERY SMALL OPENINGS FOR THE EXCLUSION OF LARVAE AT POWER PLANT COOLING-WATER INTAKES,
Tennessee Valley Authority, Norris. Div. of Water Management.
S. Vigander.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 91-105, 1978. 11 fig, 3 tab, 15 ref.

Descriptors: *Engineering structures, *Environmental effects, Intakes, Filters, Screens, Aquatic life, Powerplants, Cooling water, *Impingement.

Four specific problem areas involved in the use of screening media with very small openings are discussed: the prediction of pressure drop across a screen; estimation of pressure drop across partially plugged screens; rate of debris buildup on a site-specific stationary screen sample; and methods for stationary screen cleaning and their effectiveness. Various screen configurations are presented based on wire cross-sectional shape, weave type or method of assembly, mesh size on both surfaces and wirse size. Correlation between these parameters and pressure is discussed. Tests are currently underway on aspects of mechanical plugging of screens. So far these tests indicate no major problems. No tests have been made on biological fouling. (See also W79-07080) (Chilton-ORNL)

In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 125-139, 1978. 6 fig, 7 tab, 4 ref.

Descriptors: *Environmental effects, *Engineering structures, Intakes, Powerplants, Cooling water, Aquatic life, Larvae, Entrainment, *Impingement.

The objectives of this study were to determine the largest screen opening that would retain a high percentage of larval fish of several species representing a wide range of body shapes, to assess the influence of the velocity of approach water and the duration of impingement on percentage of fish retained, and to describe for each species the survival of the retained fish as a function of approach velocity and duration of impingement. Results showed that a 0.5 mm opening would be required to retain nearly all of the sizes and species of fish tested. Percentage retention was directly related to body depth. Velocity and impingement duration contributed little to percentage of retention. (See also W79-07080) (Chilton-ORNL)

J. H. Heuer, and D. A. Tomljanovich.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 169-194, 1978. 20 fig, 8 tab, 6 ref.

Descriptors: *Environmental effects, *Engineering structures, Powerplants, Intakes, Cooling water, Entrainment, Fish, Larvae.

This study was designed to estimate the ability of several species of larval fish to avoid impingement against and entrainment through a stationary slotted screen in flowing water. All species tested (Muskellunge, Channel catfish, Bluegill, Largemouth bass, Smallmouth bass, Striped bass, and Walleye) exhibited some ability to avoid entrainment. In general bypass or avoidance of entrainment was inversely related to slot size and slot velocity with best results being observed at 0.5-mm slot and 7.6 cm/s slot velocity. It was concluded that this screening concept has the potential for protecting most fish of impingeable size and many fish of entrainable size. (See also W79-07080) (Chilton-ORNL)

PRACTICALITY OF PROFILE-WIRE SCREEN IN REDUCING ENTRAINMENT AND IMPINGEMENT,
Ichthyological Associates, Inc., Middletown, DE. Delmarva Ecological Study.
B. N. Hanson, W. H. Bason, B. E. Beitz, and K. E. Charles.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66, p 195-233, 1978. 18 fig, 9 tab, 8 ref, 1 append.

Descriptors: *Environmental effects, *Engineering structures, *Entrainment, Fish, Larvae, Intakes, Cooling water, Powerplants, *Impingement.

These studies were conducted to determine the expected entrainment and impingement of several species of fish, larvae and eggs by 1-mm-slot well screen intake. Observations showed that 1.01-mm slot profile-wire well screen operated at an intake velocity of 15.24 cm/s virtually eliminated impingement of fishes larger than 15 mm fork length. No impingement or stress occurred with fish less than 40 mm fork length held near an intake functioning at 15.24 cm/s for as long as 3 hours. Low impingement occurred at intake velocities as high as 53.34 cm/s. In preliminary egg mortality studies it was observed that at least 95% survival can be expected at approach velocities of 15.24 cm/s and impingement durations of up to 2 minutes. These studies are on-going and some have not progressed sufficiently to allow analyses. (See also W79-07080) (Chilton-ORNL)

VALIDATION AND SOFTWARE DOCUMENTATION OF THE ANL FISH-IMPINGEMENT MODEL,
Argonne National Lab., IL. Div. of Environmental Impact Studies.
I. P. Murarka, D. J. Bodeau, and W. K. Derickson.
Available from the National Technical Information Service, Springfield, VA 22161 as ANL-ES-62, Price codes: A06 in paper copy, A01 in microfiche. Report ANL/ES-62; April 1978. 124 p. 19 fig, 10 tab, 17 ref.

Descriptors: *Environmental effects, *Intakes, Powerplants, Cooling water, Fish, Model studies, *Impingement.

Results of a validation test of the ANL Fish Impingement Model are reported. 1974 fish-impingement and environmental data from the Zion Nuclear Power Station are used in the validation test. The test indicated that the modified and expanded mathematical model yields reasonable good results in calculations of daily fish-impingement losses at the cooling water intakes. Information on fish density and abundance is concluded to be the most important variable in the calculation of fish-impingement rates and it was therefore recommended that frequent determinations of fish density be made. It was concluded that the present mathematical model is adequate in view of the gross information available on fish factors relating to impingement and that further refinement of the model is not necessary until more quantitative data on the processes relating to fish abundance and impingement rate are developed. NITRATE AND AMMONIUM CONCENTRATIONS OF GROUND WATER RESULTING FROM POULTRY MANURE APPLICATIONS,
Delaware Univ., Newark. Dept. of Plant Science.
W. C. Liebhardt, C. Golt, and J. Tupin.
Journal of Environmental Quality, Vol. 8, No. 2, p 211-215, April-June 1979. 2 fig, 4 tab, 18 ref.

Descriptors: *Groundwater, *Water pollution, *Farm wastes, *Poultry, Water quality, Leaching, Depth, Corn(Field), Fertilizers, Observation wells, Sampling, Groundwater movement, Crops, Ammonium salts, Nitrates, Soil nitrate, Nitrate dilution.

Large plots (0.402 ha) of Evesboro loamy sand received 0, 13, 27, 54, and 179 metric tons/ha of poultry manure in the spring of 1972, 1973, 1974, and 1975. Five wells were established in each plot at depths of 3, 4.5, and 6 m below the soil surface. In 1976, wells were established at 3- and 6-m depths in several other locations outside the plots. Corn was grown on these plots each year with no other additional fertilizer amendments. Water samples, taken regularly from these plots, showed that the concentration of nitrate at 3 m was affected by the application of poultry manure. At 4.5 and 6.0 m, the effect was not nearly as noticeable. There was a pronounced decrease in NO3-N concentration with increasing depth. The NO3-N concentration of water from some wells outside the plot area was quite high compared to the plot receiving no poultry manure, indicating that the source of the NO3-N in these well points was the poultry manure from treated plots. This suggested that the reduction in NO3-N at increasing depths under treated plots was partially a result of the lateral underground movement of nitrates. The concentration of NH4-N in the same water appeared to be only slightly affected, if at all. Application of poultry manure at rates higher than a crop can utilize results in nitrate movement through the soil profile and into the groundwater. (Visocky-ISWS)

CHANGES IN CONCENTRATIONS OF SELECTED CHEMICAL POLLUTANTS IN WET, TILE-DRAINED SOIL SYSTEMS AS INFLUENCED BY DISPOSAL OF SEPTIC TANK EFFLUENTS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agronomy.
R. B. Reneau, Jr.
Journal of Environmental Quality, Vol. 8, No. 2, p 189-196, April-June 1979. 4 fig, 4 tab, 20 ref.

Descriptors: *Groundwater, *Pollutants, *Soils, *Tile drains, *Septic tanks, Phosphorus, Nitrogen compounds, Water table, Seasonal, Water pollution, Agriculture, Chemicals, Tile drainage, Effluents.

Changes in P, MBAS, NH4, NO3, NO2, Cl, pH, and Eh from septic effluent disposal were monitored in shallow groundwaters between septic effluent disposal fields and an agricultural tile drainage system in an area composed of Typic and Aeric Ochraquults. As effluent moved through the soil system toward the agricultural tile, P and MBAS decreased logarithmically with distance. As much as 87% of the observed variation could be attributed to distance for both P and MBAS. Phosphorus and MBAS in groundwaters intercepted by the tile drainage system at 2 of the sites had been reduced to acceptable levels. The concentrations of inorganic nitrogenous components in relation to the disposal area were similar at all 3 locations. The NH4-N concentration was highest adjacent to the drainfield (20-30 micrograms/ml) and decreased logarithmically with distance. A maximum of 83% of the observed decrease in NH4 could be attributed to distance. The NO3 concentration increased to a maximum at approximately 5 m and then decreased with increased distance. This was substantiated by the NO3/Cl ratios which indicated that NH4 was nitrified and the NO3 produced was subsequently denitrified to a large degree. The NO3 accumulation was seasonal, with the highest concentrations present during periods of rising water tables. (Visocky-ISWS)

AN INTRODUCTION TO THE LIMNOLOGY OF ROODEPLAAT DAM,
National Inst. for Water Research, Pretoria (South Africa).
R. D. Walmsley, D. F. Toerien, and D. J. Steyn.
Journal of the Limnological Society of South Africa, Vol. 4, No. 1, p 35-52, July 1978. 25 fig, 3 tab, 33 ref.

Descriptors: *Limnology, *Roodeplaat Dam(South Africa), *Impounded waters, *Eutrophication, Phytoplankton, Oxygen demand, Chemical stratification, Morphometry, Chemical properties, Bioassay, Biological properties, Physical properties, Thermal stratification, Nutrients, Sewage effluents.

Results are presented of certain physical, chemical, and biological observations made on the impoundment at Roodeplaat Dam north-east of Pretoria between February 1973 and May 1975. At each of five sampling stations water samples were collected from different depths at monthly intervals throughout the survey period. Roodeplaat Dam is a warm monomictic impoundment with stable thermal stratification during the summer when oxygen supersaturation of the surface waters and anaerobic conditions in the hympolimnion were encountered. The seasonal water transparency was related to existing phytoplankton populations and allochthonously-introduced clay material. Chemical stratification, prominent during summer, appeared to be caused by mineralization processes in the hypolimnion and by dilution in the surface layers during summer flooding. Considerable horizontal variation in most chemical and biological characteristics was found because of the morphology of the impoundment and the fact that sewage effluents are discharged into the major inflow. Roodeplaat Dam may be classified as a highly eutrophic water body on the basis of the nutrient content of the waters and the magnitude of the phytoplankton populations observed. (Davison-IPA)

OCCURRENCE AND SIGNIFICANCE OF CANDIDA ALBICANS IN LAKE ONTARIO BATHING BEACHES,
Canada Centre for Inland Waters, Burlington (Ontario).
J. P. Sherry, S. R. Kuchma, J. Zarzour, and B. J. Dutka.
Scientific Series No. 98, 1979, 31 p, 3 fig, 75 ref.

Descriptors: *Aquatic environment, *Acquatic bacteria, *Water pollution, *Pathogenic bacteria, *Coliforms, *Yeasts, Beaches, Aquatic microbiology, Methodology, Surveys, *Lake Ontario, *Candida albicans.

It has been established that the opportunistically pathogenic yeast C. albicans occurs in Lake Ontario beaches. The four beaches surveyed could be differentiated on the basis of bacterial fecal pollution indicator levels and numbers of the pathogens C. albicans and Pseudomonas aeruginosa. The occurrence of the two pathogens in the beach waters examined appears to be related to elevated fecal pollution indicator levels. Maximum numbers of all microbial parameters were observed in July and August in association with peak bather loads at the beaches. Where microbial population levels were adequate, a decreasing distribution pattern from the shoreline to the offshore waters was observed. In only one instance does the data suggest that a beach had been subjected to human fecal contamination. Storm water runoff is the most plausible source of the contamination in most other cases, although the possibility that the bathers themselves may contribute to the pollution level of a beach must also be considered. WASTEWATER GENERATION AND DISPOSAL IN VENEER AND PLYWOOD PLANTS IN BRITISH COLUMBIA,
Environmental Protection Service, Vancouver (Ontario). Pacific Region.
R. G. Thompson.
Economic and Technical Review Report EPS 3-WP-78-7, June 1978, 28 p, 1 fig, 8 tab, 4 ref, 1 append.

Descriptors: *Wood wastes, *Waste water treatment, *Waste water disposal, *Waste water(Pollution), Industrial plants, Toxicity, Fish, Effluents, Resins, Phenols, Analysis, *British Columbia.

This investigation was carried out to characterize the wastewater from British Columbia plywood and veneer plants; to examine in plant operations that generate wastewater; and to document wastewater disposal and treatment procedures that are being used within the industry. The data obtained indicate that all wastewater generated by the plywood and veneer operations is toxic to fish at low effluent concentrations and that this toxicity increases with increased resin acid and phenolic content of the effluent. THE EFFECT OF ACID MINE DRAINAGE WATER ON TWO PENNSYLVANIA SOILS,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
E. J. Ciolkosz, L. T. Kardos, and W. F. Beers.
Soil Science, Vol. 127, No. 2, p 102-107, Feb. 1979. 2 tab, 16 ref. OWRT B-086-PA(2). 14-34-0001-6114.

Descriptors: *Acid mine water, Soil chemistry, Silicates, Water pollution effects, Soil water, Iron, Aluminum, Calcium, Hydrogen ion concentration, Pennsylvania.

The effects of acid water on soil material are discussed. Two Pennsylvania soils, Rayne and Guernsey, which had had 525 cm of acid mine water passed through, were analyzed. Lowered were the pH, calcium content, and percent base saturation of the soil material, with soil's CEC, acidity, iron and aluminum contents increased. The increase in aluminum and iron contents was much greater than was the amount of aluminum and iron added by the acid water. Thus, the acid treatments mobilized some native soil aluminum and iron in the treated soil; these same treatments also created some new CEC sites. Phosphorus data showed a depletion of phosphorus in the Rayne and a redistribution of phosphorus downward in the Guernsey. Little or no change in particle size distribution and clay mineralogy occurred as a result of the treatment. The various effects of acid water on soil materials were the greatest in the upper parts of the soil. The responses of the two Pennsylvaina soils to prolonged leaching with acid mine water were very different in magnitude but similar in direction of change of the various chemical parameters. (Tsong-Penn State)

ENVIRONMENTAL STUDIES, SOUTH TEXAS OUTER CONTINENTAL SHELF, BIOLOGY AND CHEMISTRY. VOLUME I,
Final Report 1977 to the Bureau of Land Management, January 15, 1979. 650 p. AA550-CT7-11.

Descriptors: *Environmental effects, *Baseline studies, *Resources development, *Texas, Water pollution effects, Ecosystems, Biology, Chemistry, *Outer Continental Shelf, Petroleum development, South Texas Outer Continental Shelf(STOCS).

A study of the South Texas Outer Continental Shelf (STOCS) was conducted on behalf of the U.S. Bureau of Land Management. The studies constituted the third year of a sampling program of chemical and biological parameters of the STOCS. The resultant data from this investigation represent the first step in understanding how to assess and control the impact of petroleum exploration and development in the STOCS area. The central goal of these and other environmental quality survey of continental shelf areas is the protection of the living marine resources from deleterious effects. This is the first volume of six volumes and individual studies are separately abstracted. (See also W79-07288 thru W79-07297) (Sinha-OEIS)

INTRODUCTION.
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol I,' p 1-1 - 1-31, January 15, 1979. 4 fig, 10 tab. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Environmental effects, *Ecosystems, *Water pollution effects, Sampling, Variability, Resources development, Exploration, Texas, *Outer Continental Shelf, Petroleum development, South Texas Outer Continental Shelf(STOCS).

The Texas coastal area is biologically and chemically a two part marine system, the coastal estuaries and the broad continental shelf. These two components of the marine systems are separated by barrier islands and connected by inlets or passes. The STOCS study area corresponds to the area outlined by the Department of the Interior for oil and gas leasing. The broad objectives of the 1977 study effort of the STOCS area was to continue describing the natural temporal and spatial variability of all major components of the OCS marine ecosystem. It was assumed that understanding the natural inherent variability of this ecosystem would contribute immensely to evaluating potential impact to the environment from unnatural perturbations such as oil and gas exploration and production. Samples were collected in 1977 during three biological-meteorological seasons from all transects and four of the bank stations. The sampling effort was broken up into four types of sampling: water column, benthos, histopathology and microbiology. A number of publications and presentations have resulted from the 1975-77 STOCS studies. These, along with works in progress, are presented in a table. (See also W79-07287) (Sinha-OEIS)

In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol I,' p 8-1 - 8-128, January 15, 1979. 64 fig, 27 tab, 19 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Bacteria, *Water quality, *Biodegradation, *Oil pollution, Microbial degradation, Water pollution effects, Environmental effects, Nutrients, Ecosystems, Seasonal, *Outer Continental Shelf, Petroleum development, South Texas Outer Continental Shelf(STOCS).

The 1977 water column bacteriology studies were initiated as a part of the South Texas Outer Continental Shelf (STOCS) program to identify and to quantitate the heterotrophic and hydrocarbonoclastic microbial populations; to determine the oil degradation potential of the hydrocarbonoclastic bacteria; to study the ecological succession of mixed bacterial cultures in the presence of oil; and to study the effects of different nutrients on metabolic activities of pure and mixed bacterial cultures. A total of 1,905 marine bacteria were isolated from the samples and 1,631 generic identifications have been completed at this time. Fourteen genera were represented by the isolates. Acinetobacter, Aeromonas, Alcaligenes, Flavobacterium, Pseudomonas, and Vibrio were the only hydrocarbonoclastic genera isolated from any of the three stations. They were also prevalent in the heterotrophic bacterial isolates. The highest percentage of oil degraders occurred in July and August when the heterotrophic population was decreased somewhat and the hydrocarbonoclastic populations were increased. In the winter season, the decreases in populations offshore was more pronounced. The nutrient experiments showed that addition of nitrogen, phosphate, and iron, or a complete mineral salts medium significantly enhanced hydrocarbon metabolism. (See also W79-07287) (Sinha-OEIS)

Descriptors: *Baseline studies, *Microbiology, *Fungi, *Benthos, *Biodegradation, Water pollution effects, Oil pollution, Texas, Resources development, Environmental effects, Seasonal, *Outer Continental Shelf, Mycology, Crude oil, Petroleum hydrocarbons, Mycota, South Texas Outer Continental Shelf(STOCS).

Water samples were collected at three stations during six monthly cruises. Bottom sediment samples were collected at six stations during three seasonal cruises. Sediments were diluted and water samples concentrated before plating on hydrocarbonoclastic selective and nonselective media for fungal enumeration. Sediment and water samples were overlaid with crude oil and sampled periodically to determine the effects of oil on the fungi. Upon termination of the experiments, the alkane and aromatic fractions of residual oils were analyzed to evaluate the degradation potential of each sample and the preferential degradation of individual oil components. Similar studies were conducted on fungi in pure culture. Several hundred isolates were tested for their ability to grow on crude oil as a sole source of carbon and energy. The numbers of total fungi in the water column were uniformly distributed and mcuh more abundant in spring than later in the year, but the percentage of oil-degraders increased offshore and throughout the year. Total benthic fungi increased from spring to fall. Fungal n-alkane degradation potentials of benthic and water samples tended to decrease offshore across the shelf especially during the summer. Degradation was greatly increased in the presence of river outwash. Intermediate length n-alkanes were preferentially utilized by fungi but isoalkanes were recalcitrant. Crude oil was initially toxic to the petroleum-degrading fungi but in general served to stimulate fungal growth after a period of one to several weeks. (See also W79-07287) (Sinha-OEIS)

BENTHIC BACTERIOLOGY,
Texas A and M Univ., College Station. Dept. of Marine Biology.
J. R. Schwarz, S. K. Alexander, V. L. Carpenter, S. Schropp, and J. C. Clary, III.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol I,' p 10-1 - 10-31, January 15, 1979. 9 fig, 4 tab, 26 ref. Texas University Marine Sciences Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline sgudies, *Bacteria, *Microbial degradation, *Biodegradation, Oil pollution, Water pollution effects, Environmental effects, Texas, Resources development, Sediments, *Outer Continental Shelf, *Hydrocarbons, Petroleum hydrocarbons, Pseudomonas, Bacillus, Vibrio, South Texas Outer Continental Shelf(STOCS).

Selected characteristics of benthic bacteria of the South Texas Outer Continental Shelf (STOCS) were measured. The percentage of bacteria in the population able to degrade hydrocarbons was from 0.10 to 20.68%. Bacterial populations exhibited both seasonal and spatial variations. The predominant genera of aerobic heterotrophic bacteria were Bacillus, Vibrio and Pseudomonas. Hydrocarbon degrading bacteria were predominantly species of Pseudomonas. Oil biodegradation by natural sediment populations ranged from 0 to 91.6%. Low molecular weight n-paraffins were utilized to a greater extent than high molecular weight paraffins. Degradation rates exhibited seasonal variations, but were evenly distributed geographically. The addition of oil to sediment increased bacterial populations, and changed the composition of the population to one more capable of degrading oil. (See also W79-07287) (Sinha-OEIS)

ENVIRONMENTAL STUDIES, SOUTH TEXAS OUTER CONTINENTAL SHELF, BIOLOGY AND CHEMISTRY. VOLUME II,
Final Report 1977 to the Bureau of Land Management, January 15, 1979. 603 p. AA550-CT7-11.

Descriptors: *Environmental effects, *Baseline studies, *Resources development, *Texas, Water pollution effects, Ecosystems, Biology, Chemistry, *Outer Continental Shelf, Petroleum development, South Texas Outer Continental Shelf(STOCS).

A study of the South Texas Outer Continental Shelf (STOCS) was conducted on behalf of the U.S. Bureau of Land Management. The studies constituted the third year of a sampling program of chemical and biological parameters of the STOCS area. The central goal of these and other environmental quality surveys of continental shelf areas is the protection of the living marine resources from deleterious effects. This is the second volume of six volumes and individual studies are separately abstracted. (See also W79-07299 thru W79-07309) (Sinha-OEIS)
W79-07298

PHYTOPLANKTON AND PRODUCTIVITY,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
D. Kamykowski, C. Van Baalen, J. Batterton, J.

Bird, and S. Anderson.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol II,' p 11-1 - 11-57, January 15, 1979. 30 fig, 8 tab, 9 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Phytoplankton, *Productivity, *Chlorophyll, Texas, Temperature, Salinity, Environmental effects, Water pollution effects, Resources development, *Outer Continental Shelf, *Light extinction, Carbon uptake, Skeletonema costatum, South Texas Outer Continental Shelf(STOCS).

The 1977 phytoplankton and productivity studies consisted of (1) water column light extinction measurements; (2) phytoplankton species counts; (3) chlorophyll a determinations; (4) carbon uptake determinations; and (5) continuous measurement of surface chlorophyll a, temperature and salinity along Transect II. General methods for 2, 3 and 4 are presented in flow charts. Secchi depth generally increased offshore except when unusual interdigitation of turbid and clear water coincided with station samples. Biomass generally decreased offshore both as chlorophyll a concentration and cell numbers. The nanno-fraction dominated the chlorophyll a values. The diatoms dominated inshore while the coccolithophorids dominated offshore. Carbon uptake paralleled the biomass patterns, but were less variable across the shelf. Depth profiles identified variable vertical structure during the seasonal cruises. The nanno-fraction dominated the water column at all depths especially in spring and fall. The interrelationships among Secchi depth, phytoplankton abundances, and chlorophyll a were good. Carbon uptake was anomalously high during May. A distinction can be made between the effect of Mississippi River water and more local run-off. (See also W79-07298) (Sinha-OEIS)
W79-07299

SHELLED MICROZOOPLANKTON AND GENERAL MICROPLANKTON,
Rice Univ., Houston, TX. Dept. of Geology.
R. E. Casey, K. J. McMillen, J. Gervitz, R. Schwarzer, and A. Leavesly.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol II,' p 12-1 - 12-46, January 15, 1979. 19 fig, 3 tab, 7 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, Zooplankton, *Upwelling, *Data analysis, Monitoring, Seasonal, Texas, Resources development, Water pollution effects, Environmental effects, *Outer Continental Shelf, Radiolara, Globigerina, South Texas Outer Continental Shelf(STOCS).

Depth stratified Nansen net tows and discrete depth Niskin bottle samples were collected in the BLM-STOCS study are seasonally and during July, August, November and December of 1977. Shelled microzooplankton and general microplankton were studied from the Nansen nets and Niskin bottles respectively. The shelled microzooplankton and general microplankton data were compared to the physical oceanography of the study area by use of density, diversity and other plots of the data along with cluster analysis. These comparisons revealed: ponds of water moving onto the shelf at various depths during the winter; strong upwelling in the winter and into the spring; brackish water moving out toward the open Gulf of Mexico in the spring drawing deeper open Gulf water shoreward underneath it; and, a dramatic eutrophism of the STOCS during the winter and into the spring of 1977. These conclusions were suggested by certain observed species of shelled microzooplankton that indicate the above oceanographic conditions. (See also W79-07298) (Sinha-OEIS)
W79-07300

CILIATED PROTOZOA,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
P. L. Johansen.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol II,' p 13-1 - 13-40, January 15, 1979. 14 fig, 4 tab, 21 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Protozoa, *Plankton, *Foodwebs, Texas, Water pollution effects, Environmental effects, Biomass, Resources development, *Outer Continental Shelf, *Ciliated protozoa, South Texas Outer Continental Shelf(STOCS).

During 1977, 108 one-liter samples were collected from the STOCS. These samples, which were preserved with 1% basic Lugol's fixative, were analyzed for ciliated protozoa using the Utermohl (1931) method. Of the 86 protozoan species observed, 49 were tintinnids, 10 were oligotrichs, 5 were foraminifera, 10 were radiolarian/acantharia and 12 were 'other' protozoa. Protozoa reached an abundance maximum in early spring (March-April). There was a second abundance peak in September which was thought to be abnormal and a result of Hurricane Anita, which passed through the area at that time. Oligotrichs were the most dominant group of protozoa on the STOCS. They were uniquitous and abundant both spatially and temporally. The other protozoan groups tended to be less abundant and more restricted in space and time. Protozoan biomass ranged from 1 to 348% of the macrozooplankton biomass, indicating that the protozoa are a significant component of the zooplankton community. Correlations with temperature, salinity, dissolved oxygen, netphytoplankton, nitrate and phosphate were not significant but the salinity relationship with protozoans was negative suggesting a possible ecological relationship. W79-07301

ZOOPLANKTON PROJECT,
Texas A and M Univ., College Station. Dept. of Marine Biology.
E. T. Park, P. Turk, P. Jones, M. Valentine, and M. Kaneps.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol II,' p 14-1 - 14-58, January 15, 1979. 4 fig, 25 tab. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Zooplankton, Seasonal, Sampling, Texas, Oil pollution, Metals, Water pollution effects, Environmental effects, Resources development, *Outer Continental Shelf, *Hydrocarbons, Petroleum development, Copepoda, Ostracoda, Amphipoda, Cnidaria, Mollusca, Chaetognatha, Larvacea, Cladocera, South Texas Outer Continental Shelf(STOCS).

Significant findings of the third year (1977) of zooplankton studies on the South Texas Outer Continental Shelf are detailed. When grouped by depth related stations, transects and seasons, the data show many of the trends observed in past years. The best represented major taxa were Copepoda, Ostracoda, Amphipoda, Cnidaria, Mollusca, Chaetognatha, Larvacea and Cladocera. Ostracods rivaled the copepods in abundance, especially during the winter and spring. Cladocera and Mollusca were most abundant in the spring at nearshore stations. Amphipoda, Cnidaria, Chaetognatha and Larvacea occurred in moderate numbers throughout the area and their numbers were generally greatest in the spring. Changes in temperature, salinity and chlorophyll a values showed some correlation with changes in zooplankton abundances. The maximum abundances of zooplankton occurred at nearshore stations in the spring when temperatures were in the upper half of their annual range and salinities were at their yearly low. In general, zooplankton abundances were highest at stations where chlorophyll a values were highest during each season. In addition to the normal sampling design, a sample was also collected at each station for taxonomic enumeration in conjunction with the trace metals and hydrocarbon sampling programs for zooplankton body burdens. W79-07302

NEUSTON PROJECT,
Texas A and M Univ., College Station. Dept. of Oceanography.
J. H. Wormuth, L. H. Pequegnat, McEachran, A. Hart, and J. Cummings.
In: 'Environmental Studies, South Texas Outer Continental Shelf. Biology and Chemistry, Vol II,' p 15-1 - 15-66, January 15, 1979. 39 fig, 5 tab, 12 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Taxonomy, *Ecosystems, Texas, Water pollution effects, Environmental effects, Oil pollution, Gases, Resources development, Larvae, *Outer Continental Shelf, *Neuston, Air-sea mixing, Petroleum development, South Texas Outer Continental Shelf(STOCS).

Neuston samples were collected on nine cruises on the South Texas Outer Continental Shelf (STOCS) during 1977. The samples were analyzed taxonomically and for standing crop and tar values. The taxonomic analysis of the neuston community occupying the upper 15-20 cm of the water column at specified locations included quantitative enumeration of species, dry weight and ash-free dry weight determinations and weight of tar, and was designed to characterize existing environmental conditions prior to possible environmental perturbations which might occur in the future as a result of offshore drilling for oil and gas. The neuston environment and its organisms are important to the water column ecosystem in that they occupy a relatively thin skin of the ocean surface where air-sea mixing initially occurs. Many potential pollutants are thought to enter the oceans through this route, and any biological impact might first manifest itself in changes in the neuston. (See also W79-07298) (Sinha-OEIS)
W79-07303

MEIOFAUNA PROJECT,
Texas A and M Univ., College Station. Dept. of Oceanography.
W. E. Pequegnat, and W. B. Sikora.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol II,' p 16-1 - 16-34, January 15, 1979. 5 fig, 11 tab, 43 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Nematodes, *Sediments, *Oil pollution, Texas, Environmental effects, Water pollution effects, Resources development, Gases, *Outer Continental Shelf, *Meiofauna, Petroleum development, South Texas Outer Continental Shelf(STOCS).

A total of 540 sediment samples collected between February and December 1977 from 25 transect stations and four bank stations on the South Texas Outer Continental Shelf (STOCS) were analyzed for establishment of meiofaunal populations and communities. The major objective of this investigation was to determine in a relatively small geographical area of the STOCS area, including two hard banks, the distributions, abundances, and environment of the taxonomic components of the meiofauna. These findings will play a significant role in formulation of natural conditions from which it should be possible for environmental managers to determine whether or not man's activities on the shelf are having impacts of concern on the fauna. The meiofauna can provide data and concepts that will be useful in judging the impacts of sedimental and other environmental changes that will result from discovery and production of oil and gas. W79-07304

BENTHIC INVERTEBRATES: MACROINFAUNA AND EPIFAUNA,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
J. S. Holland, S. Cornelius, A. Dixon, J. Holt, and S. Holt.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol II,' p 17-1 - 17-56, January 15, 1979. 13 fig, 6 tab, 16 ref. Texas University Marine Science Institute

Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Invertebrates, *Benthos, *Seasonal, *Data analysis, Texas, Environmental effects, Water pollution effects, Resources development, *Outer Continental Shelf, Species distribution, Petroleum development, South Texas Outer Continental Shelf(STOCS).

The third year of data collection on the South Texas Outer Continental Shelf (STOCS) benthic invertebrate study consisted of 450 samples of benthic infauna and 186 epifaunal samples collected seasonally on four transects. Infaunal data was analyzed for community structural parameters, for station and species groupings and station groups so identified were verified by use of discriminant analysis. Epifaunal data were analyzed for community structural parameters, for station and species groupings and for individual species distribution patterns by linear correlations and multivariate analyses. Single effect correlation coefficients of seven environmental parameters with the distribution of major species within each species group are presented as are linear additive models for distribution of species thought to be representative of various species groups. W79-07305

DEMERSAL FISHES,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
D. E. Wohlschlag, R. M. Yoshiyama, M. Dobbs, and E. Findley.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol II,' p 18-1 - 18-99, January 15, 1979. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Fishes, *Benthos, Data analysis, Water pollution effects, Environmental effects, Texas, Resources development, *Outer Continental Shelf, *Demersal fish, Lutjanus, Syacium, South Texas Outer Continental Shelf(STOCS).

The collection and analysis of samples of benthic fishes on the South Texas Outer Continental Shelf (STOCS) was continued for the third consecutive year. Data on relative abundances, gross distribution patterns and average catches for selected species are summarized. A brief comparison of the data contained in this report with data from the previous year (1976) was made. Correlative patterns between selected environmental parameters and several species were examined. The use of such patterns serves to identify the environmental variables of importance to demersal fishes and also represents a starting point for the development of a predictive capability for abundances of benthic fishes based on knowledge of environmental conditions. (See also W79-07298) (Sinha-OEIS)
W79-07306

HISTOPATHOLOGY OF DEMERSAL FISHES,
Texas A and M Univ., College Station. Dept. of Veterinary Anatomy.
W. E. Haensly, and J. C. Eurell.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol II,' p 19-1 - 19-32, January 15, 1979. 17 tab, 1 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Fishes, *Parasitism, *Environmental effects, Texas, Water pollution effects, Resources development, *Outer Continental Shelf, *Histopathology, Demersal fishes, South Texas Outer Continental Shelf(STOCS).

Histopathologic analyses of 15 species of demersal fishes were made. Samples were collected during nine cruises: three seasonal (February, June and October) and six monthly (March, April, July, August, November and December). The organ sampling effort included heart, stomach, kidney, muscle and liver. Organ samples were prepared for hisotologic examination by routine histologic procedures. Parasitism, both protozoan and helminthic, was the primary cause of lesions in all organs. Lesions consisted of free and encapsulated parasites with varying degrees of inflammation and necrosis. The integrity of the tissues adjacent to the lesions was maintained. Quantitative analysis of the percentages of lesions between and within various groups demonstrated that the lesions of stomach and liver were significantly more frequent throughout the study than were those of kidney, muscle and heart, while kidney lesions occurred with significantly greater frequency than did heart and muscle lesions. Cardiac lesions were significantly more frequent in the vermilion snapper (Rhomboplites aurorubens) and the red snapper (Lutjanus campechanus) than in the 13 other species. Lesion percentages that did not differ significantly were as follows: between species, except between red snapper and Atlantic threadfin (Polydactylus octonemus); between cruises within stations; between stations; between cruises within seasonal effort; between cruises within monthly effort; and between seasonal and monthly cruises. W79-07307

HISTOPATHOLOGY OF INVERTEBRATE EPIFAUNA,
Texas A and M Univ., College Station. Dept. of Biology.
J. M. Neff, and V. V. Ernst.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol II,' p 20-1 - 20-44, January 15, 1979. 15 tab, 16 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Pathology, *Invertebrates, *Monitoring, Texas, Crabs, Shrimps, Water pollution effects, Environmental effects, Resources development, *Outer Continental Shelf, Histopathology, Petroleum development, South Texas Outer Continental Shelf(STOCS).

A histopathological study of epifaunal invertebrates was carried out on 2265 organs from 453 specimens. The total number of pathologies in the gills almost equaled that in internal organs. Shrimp had the highest percent and variety of symbionts in the gills, most of which were parasitic ciliates. The total percent of other types of pathological conditions in the gills was higher than the total percent of symbionts. Crabs had by far the largest number of such conditions and molluscs had very few gill pathologies of any kind. All pathological conditions other than symbionts in the gills and internal organs could have been caused by parasites, bacteria, viruses or injuries. Most of these conditions in the internal organs, however, appeared to be related to the host's reaction to parasites. The largest percent of all pathologies in the internal organs were found in the gastro-intestinal tract of the animals studied. The purpose of this study was the continuation of the development of a data base of hitopathologies of invertebrate epifauna of the STOCS area. Such a study is necessary for environmental monitoring purposes, as such surveys have not been performed previously. Some pathological conditions were shown to differ with change in seasons and some were found only at certain depths of the Gulf. (See also W79-07298) (Sinha-OEIS)

REPRODUCTIVE CYCLE, HISTOLOGICAL-HISTOPATHOLOGICAL SURVEY OF GONADAL TISSUE AND KARYOTYPE ANALYSIS OF SELECTED SPECIES OF MACROEPIFAUNA AND DEMERSAL FISHES,
Texas Univ. Health Science Center at San Antonio. Div. of Allied Health and Life Sciences.
S. A. Ramirez, J. W. Zeagler, L. Landry, Jr., and S. D. Walker.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry, Vol II,' p 21-1 - 21-68, January 15, 1979. 10 fig, 30 tab, 46 ref. Texas University Marine Science Institute Final Report 1977. AA550-CT7-11.

Descriptors: *Baseline studies, *Fishes, *Invertebrates, *Pathology, *Reproduction, Texas, Environmental effects, Shellfish, Monitoring, Resources development, Water pollution effects, *Outer Continental Shelf, Chromosomal aberrations, Petroleum development, South Texas Outer Continental Shelf(STOCS).

The histological-histopathological characterization study of the macroepifauna and demersal fishes of the STOCS was initiated in the summer of 1976 and continued through 1977. Physiological conditions and pathological changes and/or occurrences were monitored and catalogued. This study consisted of the survey of (1) vertebrate and invertebrate gonads; and (2) karyotype analyses of vertebrate and invertebrate species. The purpose of this portion of the histopathological effort was threefold: first, to establish the normal seasonal (physiological) changes in the histology of the male and female gonads; second, to examine the gonads for pathological conditions; and third, to develop methodology for karyological analysis and establish karyotypes for marine organisms. Seasonal changes (reproductive cycle) in the histology of the gonads were only partially established. A number of pathological conditions were found in these tissues, but the incidence of pathology in the gonads was only 16.9%. Chromosomal counts and karyotypes were established for some invertebrates and fishes to provide a basis for future monitoring for chromosomal aberrations. (See also W79-07298) (Sinha-OEIS)

EUTROPHICATION OF FOUR TRANSVAAL DAMS,
National Inst. for Water Research, Pretoria (South Africa).
R. D. Walmsley, D. F. Toerien, and D. J. Steyn.
Water S. A., Vol. 4, No. 2, p 61-75, April 1978. 13 fig, 6 tab, 22 ref.

Descriptors: *Eutrophication, *Nutrients, *Impounded waters, *Chemical analysis, *Bioassay, Conductivity, Phosphorus, Nitrogen, Sewage, Industrial wastes, Effluents, Dams, Impoundments, Bufflespoort Dam, Hartbeespoort Dam, Rietvlei Dam, Roodeplaat Dam(Transvaal).

Sources of eutrophying elements were detected by chemical analyses and algal bioassays in a two year study of river waters in the catchment areas of the Bufflesport, Hartbeespoort, Rietvlei, and Roodeplaat Dams. Although the analysis of water samples included determination of other elements, only the results for phosphorus and nitrogen are discussed, because they are the most important elements of eutrophication. Mean values for conductivity, phosphate, and the combined forms of nitrogen are presented for waters obtained from each of the four catchment areas. The main cause of eutrophication of the Hartbeespoort, Rietvlei, and Roodeplaat Dams are sewage and industrial effluents; eutrophication of the Bufflespoort Dam is due to natural activities. The Vollenweider nutrient loading concept model is discussed with regard to the conditions existing at these impoundmets during the study period. This concept, based on the fact that deep lakes with short residence times tolerate higher loading rates than shallow lakes with long residence times, has allowed prediction of the threshold phosphorus loading rate above which eutrophication problems may occur. It is concluded that determination of nutrient loading rates for important water bodies in South Africa is prerequisite to establishing guidelines for eutrophication control. (Davison-IPA)

STUDY OF THE CUMULATIVE GROWTH-INHIBITING FACTORS IN RECYCLED WATER FOR CATFISH CULTIVATION,
Arkansas Univ., Fayetteville. Arkansas Water Resources Research Center.
R. W. Raible.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 117, Price codes: A03 in paper copy, A01 in microfiche. Publication No. 64, April 1979. 44 p, 10 fig, 8 tab. OWRT A-038-ARK(1).

Descriptors: *Water pollution effects, *Fish physiology, *Channel catfish, Growth rates, Environmental effects, Water reuse, Recirculated water, Metabolism, Filters, Water pollution, Water quality, Feeding rates.

Research is reported to determine whether recycled water used in the cultivation of channel catfish in closed systems accumulates catfish growth inhibiting factors. Channel catfish were grown in eight closed water-recirculating systems with individual biological filters. Tests were made of extractions of the tank water taken 120 days after fish occupation began, and repeated every 30 days for 360 days. Heartbeat rates were determined 15 minutes after sample injection by counting pulses visually from the strip chart record. It was found that the samples extracted from the closed systems consistently caused a reduction in the heartbeat rate of approximately 20% in fresh pond-raised specimen catfish. After 120 days the increased ammonia levels required reduction of the feeding rate, so that weight gain was reduced and cannibalism increased. It is thought that this metabolic disturbance is a factor in reducing the growth rate of fish closely confined in recirculating systems. (Davison-IPA)

EFFECTS OF INCREASES IN CARBON DIOXIDE IN THE EARTH'S ATMOSPHERE - A SYNTHESIS,
Biospherics Inc., Rockville, MD.
S. Smith.
NOAA, Environmental Data and Information Service, Report, February 1979. 15 p, 46 ref.

Descriptors: *Carbon dioxide, *Atmosphere, *Environmental effects, Weather, Ecology, Water temperature, Oceans, Sea level, Pollution, Global climate.

If left unchecked, increasing levels of CO2 may eventually have far-reaching consequences on a global scale. Many scientists forecast a CO2-dependent increase in temperature, with concomitant effects on weather, climate, terrestrial and marine ecology, and other dimensions of the environment. These changes may have serious implications for human industrial activities such as agriculture, fishing, and energy production and use. More research is needed to define the problem and to pinpoint the decisionmaking time frame before the problem becomes unsolvable. To reduce uncertainties and to assess the seriousness of the matter, scientists point to the need for a well-coordinated, interdisciplinary, international program. Practical ways of reducing the CO2 content of the air, either by direct removal from the air or by 'scrubbing' the effluent of powerplants, should also be investigated. The effects of continued increases in atmospheric CO2 may have implications for many diverse aspects of national and international policy. If the issue is ignored, CO2, until now a seemingly harmless trace component of the atmosphere, could eventually exert profound influences. (NOAA)

CHANGES IN WATER QUALITY IN THE NETHERLANDS DURING THE LAST CENTURY RESULTING FROM THE ACTIVITIES OF MAN,
Institute TNO for Environmental Hygiene, Delft (Netherlands).
M. A. de Ruiter.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 241-251, 1977. 6 fig, 7 tab, 12 ref.

Descriptors: *Water quality, *Surface waters, *Effects, *Netherlands, Regional analysis, Geological history, Hydrological history, Natural quality, Rainwater, Lakes, Rivers, Rhine River(Netherlands), Eutrophication, Oligotrophy.

During the last century, the Netherlands has changed from an agricultural society of 3 million inhabitants to an industrial society of 13.7 million. Fertilization, mechanization and imports of animal foodstuffs have multiplied agricultural production. All these factors have influenced the quality of the surface waters, intensified by similar developments in other countries bordering the rivers Rhine, Meuse and Scheldt. To define these influences it is important to know the water quality a century ago. A rough idea about this 'natural quality is obtained by dividing the country into two regions: The east and southeast--mostly higher ground of Pleistocene sands not influenced by the sea; and the west and north--the lower Holocene peat and clay regions, influenced by the sea. The natural water quality of the first region is oligotrophic, poor in nutrients, while the second region is eutrophic. Indications of the water quality 20 to 100 years ago support this rough sketch. From recent quality data, it seems that some waters on the higher grounds have preserved their oligotrophic quality, in spite of the influence of air pollution on precipitation. Data for the Rhine, collected for over a century, indicate the changes in water quality of this river. (See also W79-07426) (Bell Graf-Cornell)

THE POLLUTION OF WATER RESOURCES DUE TO RURAL INDUSTRIAL WASTE,
Roorkee Univ. (India). School of Hydrology.
B. S. Mathur.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October, 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 311-314, 1977. 2 fig.

Descriptors: *Water pollution, *Industrial wastes, *Effects, *Sugar industry, Surface waters, Groundwater, Effluents, Unsaturated soil zone, Subsoil water, Uttar Pradesh(India), Percolating water, Thin molasses, Bacteria, Flow.

The pollution of surface and groundwater due to rapid industrialization in the central and western parts of the providence of Uttar Pradesh in India is a growing problem. The urban industrial waste is treated partially or fully but rural industries allow the spread of effluents in and around their premises. The problem is most acute in the case of the sugar industry which is concentrated in the rural areas. A brief description is given of the nature of the industrial development and its effluent. The effect of effluents of the sugar industry on the unsaturated zone of soil is investigated. The mechanics of the pollution of the subsoil water is examined. THE IMPACT OF URBANIZATION ON STREAM QUALITY,
Maryland Univ., College Park.
R. M. Ragan, A. J. Dietmann, and R. A. Moore.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 324-333, 1977. 8 fig, 4 ref.

Descriptors: *Streams, *Water quality, *Urbanization, *Effects, *Biochemical oxygen demand, *Anacosta River basin, Washington(DC), Evaluation, Runoff, Storm water, Urban development, Land use, Floods, Hydrological cycle, Aesthetics, Fish, Streamflow, Natural basins, Landsat data, Sediment loads, Transport curves, Annual loads.

Evaluated is the impact of urbanization on the stream quality of a 1160 km2 area in the suburbs of Washington, D.C. The emphasis of the study was to examine differences in the characteristics of streams collecting runoff from natural basins and those receiving storm water runoff from urbanized areas within the same region and at the same time. Urban development in the study area is primarily recent and well planned. Data from the Landsat satellite were successfully used to separate urban and rural land-use categories. Except in areas found to have sanitary sewage entering the streams, the water quality in the urbanized areas was good. The magnitude of frequent floods was found to have increased substantially as a result of urbanization. This new hydrological regime has resulted in high sediment loads and has reduced the aesthetic value of many streams because of channel widening and degradation. There has also been a sharp reduction in fish species diversity in the urban areas, probably because of habitat destruction rather than water quality degradation. (See also W79-07426) (Bell Graf-Cornell)
W79-07461

INFLUENCE OF CIVIL ENGINEERING PROJECTS ON WATER QUALITY IN DELTAIC REGIONS,
Institute for Soil Fertility, Groningen (Netherlands).
A. J. de Groot, and W. Salomons.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 351-357, 1977. 3 fig, 1 tab, 8 ref.

Descriptors: *Civil engineering, *Projects, *Effects, *Water quality, *Deltas, *Regions, Rivers, Heavy metals, Water pollution, Estuaries, Lagoons, Harbors, Waste discharge, Suspended matter, Pollutants.

The Dutch coastal region contains the mouths of a number of rivers (Rhine, Meuse, Scheldt) which are polluted to a considerable degree with heavy metals. The pollutants are largely associated with the suspended matter in the water. In the estuaries and lagoons, these solids were formerly diluted with relatively uncontaminated marine material and subsequently mainly transported out to sea. Meanwhile, civil engineering projects have resulted in the enclosure of the river mouths (Delta plan) and a lagoon (former Zuyder Sea), as well as in the construction of large harbors (Rotterdam). The creation of fresh water lakes and deep harbors favors the sedimentation of polluted material and restricts discharge out to sea. Furthermore, the longer residence times of the river water in these reservoirs gives rise to an increase in pH and an enhanced adsorption of dissolved pollutants to the sediments. The above-mentioned processes were studied for many years in the relevant areas. The consequences of the enhanced retention of polluted sediments will be discussed with respect to environmental quality. (See also W79-07426) (Bell Graf-Cornell)

GROUNDWATER CONTAMINATION BY WASTE DEPOSITS AND THE IMPLICATIONS FOR METHODS OF REFUSE DISPOSAL,
Hessisches Landesamt fuer Bodenforschung, Wiesbaden (Germany, F.R.).
A. Gowler, G. Matthess, and W. Schneider.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 365-369, 1977. 8 ref.

Descriptors: *Groundwater, *Water pollution, *Waste deposits, *Waste disposal, Effects, Management, Self-purification, Hydrogeological aspects, Waste sites, Precipitation.

During 1964-1973, the effects of three waste deposits on the chemical, physical, microbial and hygien-

ic properties of shallow groundwater were extensively studied. The three waste sites are situated in areas underlain by porous non-consolidated aquifers. With a groundwater flow velocity of less than 1 m/day, the presence of nearby surface water flows and air permeable strata above the groundwater table, the groundwater regains its normal condition by dilution and self-purification after a few or several hundred metres of flow. The self-purification processes cover geochemical and biogeochemical reactions, precipitation and coprecipitation, mechanical filtration, absorption and ion-exchange, and gas exchange. The evaluation of the results and the comparison with other case studies of polluted plumes supply criteria for the choice of sites and feasible methods for controlled dumping. The most suitable forms of groundwater protection are central sanitary landfills, where waste materials of different origin and composition are deposited principally above the groundwater table. Suitable sites are areas with low precipitation, a large distance between the ground surface and the groundwater table, aquifers of good self-purification capacity, poor groundwater quality and low groundwater flow velocity. Areas with unsuitable ground properties (karstic and fissured aquifers) usually necessitate expensive protective measures. (See also W79-07426) (Bell Graf-Cornell)
W79-07467

THE WATER QUALITY EFFECT OF URBANIZATION AND THE RE-USE OF WASTE WATER IN THE PHOENIX, ARIZONA (USA) URBAN AREA,
Boyle Engineering Corp., Phoenix, AZ.
R. L. Ewing.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of Amsterdam Symposium, October, 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 457-466, 1977. 2 fig, 1 tab, 8 ref.

Descriptors: *Water policy, *Urbanization, *Water quality, *Effects, *Water reuse, *Waste water(Pollution), Industrialization, Groundwater, Population growth, Nonpoint source pollution, Phoenix(Arizona).

Water has probably been the single most important factor contributing to the phenomenal growth of the Phoenix urban area (5950 km2 - 1,200,000 population) in the midst of the arid Arizona deserts. However, this tremendous population growth, accompanying domestic requirements and continued agricultural demand have resulted in a groundwater depletion rate of close to 780 x 10 to the sixth power cu m year with an accompanying deterioration of an already poor quality water. Agricultural applications of fertilizers and leaching operations coupled with urban storm water runoff have further aggravated the problem by providing a poorer quality recharge water. To help alleviate this problem, a comprehensive water and water-related land resources management program has been initiated to insure the availability of acceptable quality water for the future. This program includes the evaluation of both point and non-point sources of pollution in the urban area and in addition it addresses the reuse of reclaimed waste water for the enhancement of local water conditions by the use of land application systems and industrial reuse. This includes the use of 173 x 10 to the sixth power cu m/year for atomic plant cooling. (See also W79-07426) (Bell Graf-Cornell)

POLLUTION OF RIVER WATER IN IRAQ,
Ministry of Planning, Baghdad, Iraq.
M. H. Al-Muhandis.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 467-470, 1977.

Descriptors: *Urbanization, *Effects, *Water pollution, *Tigris River(Baghdad), *Iraq, Drainage, Farms, Sewerage, Networks, Pipes, Storm drainage, Agriculture, Industries, Housing.

One of the major problems resulting from undertaking an intensive housing program and establishing farm drainage schemes in Iraq is water pollution of the two main rivers, the Tigris and the Euphrates. The pollution has taken place for the following reasons: (1) there is a large number of pumping stations along the Tigris near Baghdad discharging drainage water from the agricultural areas directly into the river; (2) there is a number of sewage pipes connected to the storm drainage network discharging directly into the main river; (3) there are some natural old drains crossing heavily populated areas, carrying all kinds of effluent directly into the main rivers; and (4) there is a number of private agencies for the removal of sewage from houses by tankers, and these unload into the main river. Important points are given for consideration in the preparation of a plan for a sewerage network system. (See also W79-07426) (Bell Graf-Cornell)

5D. Waste Treatment Processes

THE REGENERATION OF CLINOPTILOLITE BY BIOLOGICALLY RESTORED BRINE,
Minnesota Univ., Minneapolis. Dept. of Civil and Mining Engineering.
M. J. Semmens.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 507, Price codes: A10 in paper copy, A01 in microfiche. University of Illinois at Urbana-Champaign, Water Resources Center Final Report No. UIUC-WRC-79-0139, and Research Report No. 139, March 1979. 215 p, 72 fig, 34 tab, 48 ref, 3 append. OWRT B-102-Ill(5).

Descriptors: *Waste water treatment, *Water treatment, *Zeolites, *Ion exchange, *Nitrification, Chemical reactions, Ammonia, Computer models, Biological treatment, Brines, Research and development.

In sequential regeneration of clintoptilolite the ion exchange and nitrification steps are completely separated for the optimization of each process. Neutral pH regeneration studies, initially conducted with brine concentrations compatible with the nitrification process, were extended with computer modeling studies. The simulation models were designed to predict regeneration efficiency and ammonium removal performance during service operations, and were developed to be used as a design tool and to predict zeolite performance under varying operational conditions. In sequential regeneration pilot studies the ion exchange and nitrification processes were operated simultaneously to identify potential operational difficulties, to evaluate ammonium removal performance over numerous operating cycles, to evaluate the chemical requirements and the best regenerant pH, and to determine calcium and magnesium buildup in the recycled regenerant. The kinetics of ammonium oxidation, identified in nitrification studies conducted with recycled regenerant, were comparable to those reported by others for domestic waste water treatment. The rate and extent of ammonium displacement by pH regenerant was observed to be independent of regenerant flow rate in the range of 4 to 20 bed volumes/hr. It is concluded that 75% regeneration of exhausted clinoptilolite may be achieved with 12 bed volumes of 0.3 M sodium chloride. (Davison-IPA)

STUDIES ON THE BIOLOGICAL REGENERATION OF ACTIVATED CARBON,
Rhode Island Univ., Kingston.
G. Houston.
paper copy, A01 in microfiche. Master's Thesis, 1978. 46 p, 4 fig, 7 tab, 33 ref. OWRT A-063-RI(2).

Descriptors: *Activated carbon, *Adsorption, *Microorganisms, E. coli, P. aeruginosa, Growth rates, Organic compounds, Biochemistry, Microbiology, Waste treatment, Waste water treatment, Laboratory tests.

Research is reported on the regeneration of activated carbon exhausted by microorganisms. A mineral medium capable of supporting microbial growth was added to carbon saturated with glucose or hydrocarbon (nonane or decane), and innoculated with Escherichia coli or Pseudomonas aeruginosa. The carbon absorbed the glucose from the solution until an equilibrium was reached between the glucose in solution and that absorbed to carbon. In the glucose-E. coli system carbon regeneration was faster and growth was heavier than in the hydrocarbon-P. aeruginosa system. Glucose supported E. coli growth five days; hydrocarbon supported P. aeruginosa growth for three weeks. The absorption capacity of regenerated carbon previously exhausted with glucose was comparable to that of virgin carbon; the absorption capacity of carbon previously exhausted with the alkanes was reduced about 66%. A surfactant reportedly produced by P. aeruginosa to aid in hydrocarbon solubilization may utilize adsorption sites. The reduced adsorption capacity may also be due to metabolic end products and/or cells of the regenerating organism. The adsorbed hydrocarbon, being more firmly bound, may account for slower regeneration and growth of the organism in closer contact with the carbon. In the glucose-E. coli system, growth characteristics and the fully regenerated adsorption capacity suggest that as glucose is utilized, the less firmly bound nutrient is made available for growth in the liquid medium. TREATABILITY OF OIL AND GREASE DISCHARGED TO PUBLICLY OWNED TREATMENT WORKS,
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 684, Price codes: A02 in paper copy, A01 in microfiche. Report EPA/440/1/75/066, 1975. 16 p, 12 ref.

Descriptors: *Industrial wastes, *Oil industry, *Oil wastes, *Mineral industry, *Waste water treatment, *Performance, *Treatment facilities, Regulation, Biodegradation, Microorganisms.

Available information indicates that grease and oil of animal and vegetable origin is metabolized by microorganisms in secondary waste treatment facilities. Thus, pretreatment requirements are not needed for these compounds. Oils and grease of mineral or petroleum origin are less biodegradable. One study indicated that the influent to biological treatment systems should contain less than 75 mg/liter and preferably less than 50 mg/liter oil and grease. Because a dilution of at least two occurs, a limit of 100 mg/liter on the discharge of oils and grease of petroleum and mineral origin is reasonable. (Small-FRC)

NEED FOR IMPROVED OPERATION AND MAINTENANCE OF MUNICIPAL WASTE TREATMENT PLANTS. (REPORT TO CONGRESS),
Comptroller General of the United States, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 296, Price codes: A06 in paper copy, A01 in microfiche. Report B-166506-700901, 1970. 104 p, 1 fig, 1 tab, 11 append.

Descriptors: *Treatment facilities, *Performance, *Municipal wastes, *Industrial wastes, *Inspection, *Operations, Maintenance, Toxicity, Biological treatment, Biodegradation, Evaluation.

Federal Water Quality Administration studies and records of plant inspections were reviewed and waste treatment plants were inspected in this investigation of operation and maintenance problems. Many plants were experiencing problems due to inadequate controls over industrial sources of pollution, inadequate numbers of qualified personnel, and inadequate plant design or equipment deficiencies. Municipal plants experience difficulty treating industrial wastes that have not been pretreated. In some cases, toxic industrial wastes can kill bacteria necessary for secondary treatment. Design deficiences result in insufficient plant capacity or insufficient equipment. Difficulties with equipment is a major problem. Suggestions of the prevention, detection, and correction of municipal plant operation and maintenance problems are presented. The Federal Water Quality Administration should establish comprehensive guidelines for determining operation and maintenance needs and help the state improve procedures for preventing, detecting, and correcting plant problems. ENVIRONMENTAL EFFECTS OF LAND APPLICATION OF DIGESTED MUNICIPAL SEWAGE SLUDGE,
National Science Foundation, Washington, DC. Applied Science and Research Applications.
J. T. Trout, J. L. Smith, and D. B. McWhorter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 481, Price codes: A07 in paper copy, A01 in microfiche. Report NSF-RA-E-75-186, 1975. 137 p, 16 fig, 22 tab, 75 ref, 7 append.

Descriptors: *Land management, *Application methods, *Municipal wastes, *Sewage sludge, *Environmental effects, Coliforms, Biochemical oxygen demand, Groundwater, Water pollution, Leachate, Nutrients, Heavy metals, Monitoring.

The land application of municipal sewage sludge was investigated as an alternative to other disposal methods and as a method to reuse beneficial sludge constituents. A subsurface injector was used to apply sludge from a 4.3 mgd waste water treatment plant in Boulder. Colorado to a 4.4 hectare site. Potential environmental hazards included pathogen, heavy metal, nutrient, and salt contaminants to soil and groundwater. Monitoring was carried out using groundwater monitoring wells and leachate vacuum extractors. Also, corn was grown on one sludge treated area. Leachate, groundwater, soil, and corn tissue were analyzed. Salt buildup can create a short term hazard. Ninety-nine percent of the sludge BOD loading was retained in the soil, and oxygen demand presented no hazard to the groundwater. Fecal coliforms did not extend more than 120 to 150 cm into the soil, and did not last more than 2 1/2 months on the soil surface. Heavy metal contaminated was not a problem up to 65 m ton/ha sludge loadings. Nitrate leaching to the groundwater was substantial, but can be controlled with management techniques involving balancing nitrogen applications with crop uptake. Monitoring is necessary for sludge application programs to detect any environmental hazards. (Small-FRC)

EVALUATION OF PHYSICAL CHEMICAL TREATMENT AT ROSEMOUNT,
Metropolitan Waste Control Commission, St. Paul, MN.
R. C. Polta, R. W. DeFore, and W. K. Johnson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-292 288, Price codes: A06 in paper copy, A01 in mirofiche. Report EPA-600/2-78-201, 1978. 188 p, 48 fig, 64 tab, 39 ref.

Descriptors: *Treatment facilities, *Tertiary treatment, *Monitoring, *Filtration, *Carbon filters, Ion exchange, Lime, Biochemical oxygen demand, Suspended solids, Phosphorus, Ammonia, Waste water treatment, Municipal wastes.

A performance and cost evaluation was conducted over a two-year period at the 0.25 mgd demonstration Rosemount, Minnesota, advanced waste water treatment plant. The facility utilizes chemical clarification, filtration, carbon adsorption, and ion exchange, with carbon regeneration and zeolite regeneration and brine recovery for the ion exchange media conducted on-site. Over the two-year period, the plant averaged removals of 99% suspended solids, 93% BOD, and 94% total phosphorus. The chemical feed systems included lime, ferric chloride, polymer and nitrate, sulfuric acid, chlorine, and caustic. Significant variation in ammonia reduction occurred due to modifications in the zeolite regeneration system. When the lime controlled pH of the waste water was lowered from 10.5 to 9.5 treatment efficiency decreased significantly; ferric chloride dosing maintained an effluent phosphorus level of 1 mg/liter or less. Carbon columns averaged 55% soluble COD reduction; excessive carbon losses were attributed to the lack of adequate screening. Regenerant volume and pH were found to be the most significant variables in the ion exchange system for removing NH3-N. From the demonstration plant data, it was estimated that a 10 mgd tertiary treatment plant would cost $.56-.83/1000 gal for operation and maintenance. (Lisk-FRC)
W79-07037

PERFORMANCE EVALUATION OF THE AERATED LAGOON SYSTEM AT WINDBER, PENNSYLVANIA,
Pittsburgh Univ. at Johnstown, PA. Div. of Natural Sciences.
C. M. Earnest, E. A. Vizzini, D. L. Brown, and J. L. Harris.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-281 368, Price codes: A13 in paper copy, A01 in microfiche. Report EPA-600/2-78-023, 1978. 295 p, 11 fig, 8 tab, 6 ref, 5 append.

Descriptors: *Aerated lagoons, *Sewage treatment, *Water quality standards, *Biochemical oxygen demand, *Nitrification, Suspended solids, Coliforms, Nitrates, Nitrites, Aeration, Waste water treatment, Municipal wastes, Monitoring.

The treatment effectiveness of the Windber, Pennsylvania, 2.0 mgd waste water aeration lagoon was monitored over a one-year period. Effluent from the aerated lagoon system, which consists of three cells in series, consistently met Federal Secondary Treatment Standards for suspended solids, fecal coliforms, pH, and BOD except during the month of July when BOD removal decreased to 82%. The cause of this reduced efficiency was attributed to a solids upset in the first cell. Further study of the occurrance of solids upset in the cells was recommended. Nitrate-nitrogen ion concentrations exceeded nitrite-nitrogen levels during the monitoring period except in June, July, and August when a reversal was observed. The cause of the formation of a less oxidized form of nitrogen in the nitrification process was unknown. The aerated lagoon treatment system was considered a suitable process for small towns with similar climates to the Pennsylvania facility. (Lisk-FRC)

LABORATORY AND PILOT PLANT EVALUATION OF INTERMITTENT LOADING ON SMALL-SCALE EXTENDED AERATION BIOLOGICAL SYSTEMS,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Environmental Effects Lab.
J. L. Mahloch, D. E. Averett, and M. Headstream.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A050 751, Price codes: A06 in paper copy, A01 in microfiche. Report 1977. 96 p, 23 fig, 27 ref, 3 append.

Descriptors: *Mathematical models, *Activated sludge, *On-site data collections, *Aeration, *Seasonal, Waste water treatment, Performance, Laboratory tests.

A mathematical model was developed to predict the performance of a completely mixed activated sludge system under intermittent loading conditions which are defined as time-dependent hydraulic and organic loading conditions. The model was first verified with laboratory data from a bench scale extended aeration system. It was also verified with field data from a prototype extended aeration package treatment plant. Parameters included effluent quality, dissolved oxygen uptake, and other performance indicators. The laboratory study indicated that an extended aeration activated sludge system will generally perform satisfactorily under intermittent loading conditions. (Small-FRC)

SELF-CONTAINER SANITATION SYSTEMS FOR 2- TO 15-MAN POLAR FACILITIES,
Naval Civil Engineering Lab., Port Hueneme, CA.
B. W. Valentine.

Available from the National Technical Information Service, Springfield, VA 22161 as AD-893 724, Price codes: A03 in paper copy, A01 in microfiche. Report, 1972. 41 p, 5 fig, 17 tab, 19 ref, 5 append.

Descriptors: *Sewage treatment, *Evaluation, *Costs, *Chemical degradation, *Chemicals, Waste storage, Sanitary engineering, Design, Polar regions.

The NCEL Mechanical-Flush Chemical Toilet was compared with commercially available self-contained sanitation systems. The toilet consisted of a simple baffled tank and mechanical flushing system. Copper sulfate pentahydrate and sodium bisulfate are used to treat the waste. The toilet has a 13 gal capacity. Estimated cost to produce large quantities of units is $250 to $300. The toilet has been laboratory and field tested. The Thetford Model 600 minimum-water flush toilet was the most cost effective system for pioneer polar camps housing 2 to 6 men. The Mission West Model 727 recirculating chemical toilet should be considered for camps with more than four men in areas of minimum water supply. Although the NCEL Mechanical-Flush Chemical Toilet possesses many desirable features, no further effort is recommended to develop the system for use in a polar camp. (Small-FRC)
W79-07042

PROCESS DESIGN FOR TREATING SHOWER WASTEWATER BY ULTRAFILTRATION,
Army Mobility Equipment Research and Development Command, Fort Belvoir, VA. Energy and Water Resources Lab.
D. S. Lent.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A043 716, Price codes: A09 in paper copy, A01 in microfiche. Report, 1977. 172 p, 8 fig, 4 tab, 5 append.

Descriptors: *Mathematical models, *Waste water treatment, *Filtration, *Performance, *Domestic wastes, Boundary layers, Equations, Membranes.

Curve fitting was investigated for the empirical explanation of shower waste water treatment by ultrafiltration. A two-part model is proposed. Initially, the formation of the boundary layer causes an unsteady state. Later, the system comes to a steady state when the rates of boundary layer formation and decay reach constant values. The model was evaluated on two separate ultrafiltration systems. Each system had a different membrane configuration. The hollow-fiber system can be described by a single, empirical equation of exponential order because the system studied was never allowed to reach steady state. The spiral-wound membrane system can be described emperically by an exponential equation during boundary layer formation and by a linear equation during steady state operation. (Small-FRC)

WASTEWATER ENGINEERING AND MANAGEMENT PLAN FOR BOSTON HARBOR - EASTERN MASSACHUSETTS METROPOLITAN AREA EMMA STUDY, VOL. 6. FORMULATION OF WASTEWATER UTILIZATION PLAN,
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 800, Price codes: A04 in paper copy, A01 in microfiche. Report, 1975. 67 p, 8 fig, 12 tab.

Descriptors: *Municipal wastes, *Sewage treatment, *Waste water treatment, *Project planning, *Costs, Massachusetts, Coasts, Ultimate disposal.

Formulation of the waste water utilization plan for EMMA is described. The maximum Deer and Nut Island treatment plant service area was established and peripheral communities were eliminated from further analysis. Various factors important to the selection process were identified and evaluated. A rating form was developed to assist the technical subcommittee in listing the factors to be considered. A concept of moderate decentralization was adopted, and the recommended plan was selected. The recommended plan included the enlargement of the Deer Island Treatment Plant and the reduction of the service area for the Nut Island plant. Fifty-one communities are included. Secondary treatment will be provided at the coastal plants and advanced treatment at inland plants. Construction staging alternatives are discussed. Other treatment options are explored including total ocean discharge and ocean discharge in lieu of secondary treatment. A cost comparison is included of treatment options and the recommended plan. (Small-FRC)
W79-07044

CARBON TREATMENT OF OTTO FUEL WASTEWATER - A LABORATORY STUDY,
Naval Surface Weapons Center, White Oak Lab., Silver Spring, MD.
J. E. Mastroianni, and W. F. Newton.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A040 986, Price codes: A02 in paper copy, A01 in microfiche. Report, 1977. 22 p, 6 fig, 7 tab, 2 ref, 5 append.

Descriptors: *Activated carbon, *Adsorption, *Waste water treatment, *Fuels, *Performance, Costs, Pilot plants, Incineration, Landfill.

Activated carbon was effective in removing Otto Fuel from waste water generated in overhauling and refueling the MK46 and MK48 torpedoes. Otto fuel is composed of a nitrate ester in solution with a desensitizing agent and a stabilizer. A preliminary large-scale run on the Calgon Filterasorb Pilot Plant showed a carbon cost of $.018/gal of waste water treated as compared to .43/gal for disposal by incineration. Filtersorb 400 was selected after a comparison study of eight commercially available carbons. Former waste water treatment methods included incineration and landfill; both are effective but expensive. (Small-FRC)

EVALUATION OF AN EXTENDED AERATION PROCESS FOR SKOKOMISH SALMON PROCESSING WASTEWATER TREATMENT,
Kramer, Chin, and Mayo, Inc., Seattle, WA.
S. S. Lin, and P. B. Liao.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-292 750, Price codes: A07 in paper copy, A01 in microfiche. Report EPA-600/2-79-027, 1979. 128 p, 18 fig, 13 tab, 10 ref, 3 append.

Descriptors: *Food processing industry, *Industrial wastes, *Waste water treatment, *Aeration, *Performance, Biochemical oxygen demand, Suspended solids, Ammonia, Nitrogen, Phosphorus, Pilot plants, Chemical oxygen demand, Oil.

Waste water characteristics for hand-butchered salmon processing determined that small salmon processing generated more waste water flow and higher pollutant contents per kkg of fish processed than did large salmon processing. For both cases, waste water flows and pollutant concentrations were highly variable. For full-scale plant operation, removal efficiencies of BOD, COD, suspended solids, grease and oil, and ammonia for small fish processing were similar to those for large fish processing. Higher removal efficiencies for nitrogen and lower removal efficiencies for phosphorus during large fish processing were the result of low flow resulting in longer detention times and overaeration. The effect of shorter detention times was investigated in a pilot plant study. Pilot plant removal efficiencies were similar to those for the full-scale plant for COD, BOD, TKN, and ammonia, but higher for solids, grease and oil, and phosphorus. The shorter detention time and proper overflow rate resulted in higher removal efficiencies for suspended solids, oil and grease, and phosphate. During long periods of processing plant shutdown, artificial feeding with fish food and no feeding were studied. At startup, the system was able to handle normal loading in both cases. (Small-FRC)
W79-07046

AN ECONOMIC COMPARISON OF SLUDGE IRRADIATION AND ALTERNATIVE METHODS OF MUNICIPAL SLUDGE TREATMENT,
Battelle Pacific Northwest Lab., Richland, WA.
S. B. Ahlstrom, and H. E. McGuire.
Available from the National Technical Information Service, Springfield, VA 22161 as PNL-2431, Price codes: A08 in paper copy, A01 in microfiche. Report PNL-2431, 1977. 151 p, 9 fig, 14 tab, 30 ref, 2 append.

Descriptors: *Irradiation, *Sludge treatment, *Disinfection, *Costs, *Performance, Heavy metals, Microorganisms, Municipal wastes, Biodegradation.

The relative economics of radiation treatment of sludge and other treatment processes is discussed. Radiation is a high-level disinfection process and should be considered only if high levels of disinfection are required. The handling, transporting, and pathogen growback problems associated with disinfected wet sludge, make it less attractive for reuse than dry sludge. The radiation of composted sludge produces a product of similar quality at less cost than any thermal treatment and/or flash drying treatment with high degrees of disinfection. When pathogens are inactivated, the sludge can be reused as, for example, a soil conditioner. Heavy metal content, especially cadmium, may limit the reuse of sludge despite high disinfection levels. Sludge subjected to treatment schemes producing only 5% moisture has probably been disinfected sufficiently without being irradiated. The cost of irradiating wet sludge is greater than the cost of pasturization; thus, irradiation is not a desirable method for wet sludge. Radiation is the least expensive option for dry sludge if additional disinfection is required after composting. (Small-FRC)

TOTAL RECYCLE SYSTEMS FOR PETROCHEMICAL WASTE BRINES CONTAINING REFRACTORY CONTAMINANTS,
Dow Chemical Co., Freeport, TX.
M. A. Zeitoun, C. A. Roorda, and G. R. Powers.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-293 158, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-79-021, 1979. 108 p, 37 fig, 23 tab, 15 ref, 5 append.

Descriptors: *Industrial wastes, *Waste water treatment, *Recycling, *Reverse osmosis, *Electrodialysis, Salts, Chemical wastes, Ammonia, Organic compounds, Costs, Adsorption.

The feasibility of total recycle of petrochemical waste waters was studied. A combination of reverse osmosis and electrodialysis was operated as a hybrid system using pretreated wastes. The waste water is generally high in salt and refractory organics. Stream 1 had a salinity of 1.4% NaCl when neutralized and contained on the average 0.5% organic amines and ammonia. It contained enough silica to foul the membranes. Stream 2 contained 4.5% dissolved solids and precipitated aluminum salts when neutralized with acid. The average organic content of aromatics was 90 mg/liter of TOC. The total recycle system for Stream 1 was composed of ammonia stripping, carbon adsorption and recovery of organic amines, neutralization, and silica removal before the ED-RO hybrid. The total recycle system for Stream 2 was composed of neutralization, settling and centrifugation to recover Al(OH)3, and carbon adsorption with thermal regeneration before the ED-RO hybrids. For a 1 mgd treatment facility, Stream 1 capital cost is estimated at $6,949,550 (1975 dollars), and Stream 2 is $9,170,000. Operating cost for Stream 1 is $5,291,700, and $2,293,700 for Stream 2. For Stream 1, the carbon adsorption step has estimated operating cost of $2,358,000 and the recovered organics should recycle at an estimated $3,000,000. The system was not economically feasible when applied to industrial waste waters containing relatively high concentrations of salt. (Small-FRC)

DRAFT ENVIRONMENTAL IMPACT STATEMENT: GREENSBORO-GUILFORD COUNTY, NORTH CAROLINA, 201 WASTEWATER TREATMENT SYSTEM, EPA PROJECT NOS. C37037601, C37036901.
Environmental Protection Agency, Atlanta, GA. Region IV.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 097, Price codes: A15 in paper copy, A01 in microfiche. Report, 1977. 323 p, 162 fig, 60 tab, 87 ref.

Descriptors: *Environmental effects, *Treatment facilities, *Outlets, *Outfall sewers, *North Carolina, Tertiary treatment, Streams, Odor, Evaluation, Flood control, Silting, Air pollution, Waste water treatment, Municipal wastes, Water pollution.

An environmental impact statement has been completed for Greensboro-Guilford County, North Carolina, where the existing North Buffalo Creek Treatment plant will be upgraded to tertiary treatment at 16 mgd, abandoning the South Buffalo Creek Treatment Plant, and constructing a 60-in. diameter outfall from that plant location to a new 20 mgd plant located 26,000 ft downstream on South Buffalo Creek. These actions will eliminate the discharge of inadequately treated municipal waste water, provide adequate facilities for the treatment of existing and future waste loads, and allow for orderly growth in the county. The major direct adverse impacts will be temporary increases in stream siltation and air-borne particulates; some natural vegetation destruction; elevated noise levels; stressed stream quality in the Greensboro vicinity due to industrial discharges and urban runoff; a substantial decrease in streamflow below the existing facility; and the need for control of disease carrying or transmitting insects below the existing outfall for several years. Adverse secondary impacts will be increased flooding, increased urban runoff, continued terrestrial habitat attrition, and increased air pollution due to population growth. In addition to improved water quality, beneficial impacts will be odor abatement near the old plant, and orderly planning of urban growth without detrimental environmental impacts. (Lisk-FRC)

POLLUTION FROM MAJOR MUNICIPAL WASTE SOURCES IN DADE COUNTY, FLORIDA,
National Field Investigations Center, Denver, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 327, Price codes: A03 in paper copy, A01 in microfiche. Report EPA/330/2-71/002, 1971. 36 p, 1 fig, 8 tab, 1 append.

Descriptors: *Treatment facilities, *Biochemical oxygen demand, *Suspended solids, *Discharge measurement, Effluents, *Activated sludge, Tertiary treatment, Waste water disposal, Streams, Channels, Waste water treatment, Florida, Municipal wastes.

An inventory of the major sources of municipal wastes in Dade County, Florida, the treatment efficiencies of 27 municipal waste water plants, and the impacts of wastes on receiving waters are presented. Of the 27 plants surveyed, 16 utilize the activated sludge process, five plants have trickling filters, the remainder have a combination of these two treatment processes, 3 plants provide additional treatment with microstrainers, 2 plants provide tertiary treatment, and 3 plants have oxidation lagoons. About 41% of the plants reduce BOD by 90% or more, 11 plants provide 80-90% removal, and 19% remove less than 80% of the BOD. About 22% of the plants achieve 90% or more suspended solids removal, 11 plants remove 80-90% of suspended solids, and 36% provide less than 80% removal. Five plants achieve 90% BOD and suspended solids removal; these plants discharge about 2% of the total municipal waste water, indicating that the remaining 98% of the municipal waste water receives inadequate or no treatment. The daily BOD and suspended solids loadings on waterways and tributaries from municipal waste water treatment facilities are discussed. (Lisk-FRC)
W79-07054

SEPTIC TANK - SAND FILTER SYSTEMS FOR TREATMENT OF DOMESTIC SEWAGE,
Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
N. A. Chowdhry.
Report W64, 1977. 47 p, 10 fig, 21 tab.

Descriptors: *Filtration, *Domestic wastes, *Sewage treatment, *Sands, *Soil filters, *Performance, Phosphorus, Nitrogen, Efficiencies, Biochemical oxygen demand.

In a continuation of a study of domestic sewage treatment by underdrained filter systems, four filters containing media with different chemical and/or physical characteristics were investigated for capability of phosphorus removal. The media were sand, red mud, crushed limestone, and natural soil. Biochemical oxygen demand was reduced by 96% or more and nitrogen compounds were oxidized to nitrates leaving only traces of ammonia and organic nitrogen. Red mud was the most effective in the removal of phosphorus. There was an efficiency of more than 89% during the first year and was 62% after five years of operation. Crushed limestone had an initial efficiency of 89% for phosphorus removal, but this declined rapidly after 3 months. Natural soil filters reduced phosphorus content by 68% during the first year and by 48.4% by the end of the second year. Soil filter efficiency depended on the silt and clay content of the soil. OPERATIONAL CONTROL PROCEDURES FOR THE ACTIVATED SLUDGE PROCESS. PART III-B. CALCULATION PROCEDURES FOR STEP-FEED PROCESS RESPONSES,
National Field Investigations Center-Cincinnati, OH.
A. W. West.
Report, 1975. 31 p, 7 fig, 2 tab.

Descriptors: *Activated sludge, *Operations, *Equations, *Flow, *Design, Aeration, Waste water treatment, Sewage treatment, Performance, Oxidation.

Calculation procedures used to determine the sludge and waste detention times in a step-feed configuration are described. The aeration tank characteristics used in a presented example differ from those in Part III-A because the tank is divided onto four equal step-feed bays. Flows differ only slightly when the sludge wasting rate is set at zero. Shifting waste water in-flow locations exerts forces on mixed liquor sludge oxidation that are opposite to those exerted on waste water treatment. The illustrated examples are intended to emphasize how the activated sludge process reacts to changes in waste water feed-point locations. Calculation Forms are presented which illustrate an orderly procedure to determine, and at times predict, process response to various step-feed loadings. (Small-FRC)

OPERATION OF STABILIZATION PONDS IN A TROPICAL AREA,
Gorgas Memorial Inst., Washington, DC.
L. E. Eckley, L. Cantor, and G. Reid.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-B015 604, Price codes: A13 in paper copy, A01 in microfiche. Report, 1974. 294 p, 3 fig, 67 tab, 88 ref, 11 append.

Descriptors: *Oxidation lagoons, *Anaerobic digestion, *Aerobic treatment, *Sewage treatment, Biodegradation, *Tropical regions, Biochemical oxygen demand, Chemical oxygen demand, E coli, Nutrient removal, Waste water treatment, Municipal wastes.

A series of phase studies investigated the use of single and multiple stabilization ponds for the treatment of secondary waste waters as a simple and inexpensive method of treatment in tropical regions. Initial studies established single ponds 4-6 ft in depth; subsequent studies evaluated multiple pond configurations providing anaerobic and aerobic modes of operation. The optimum pond configuration for treating the waste waters was found to be a three pond system, operating in the order of an anaerobic pond, a facultative pond, and a maturation pond. This system reduced BOD by 75%, COD by 60%, organic and ammonia nitrogen by 58%, and E. coli by 91%; orthophosphates and nitrates increased in this and most other systems studied. The maximum loading for this system was 150 lb BOD/acre/day. Design effluent removals based on influent content, influent-effluent flow, and meteorological considerations were developed with multiple regression analyses. Studies were also conducted on S. typhi survival in the ponds, shock loadings of selected pesticides, mosquito control, and sludge build-up. (Lisk-FRC)

TREATMENT OF AMMONIA PLANT PROCESS CONDENSATE EFFLUENT,
Louisiana Chemical Association, Baton Rouge.
C. J. Romero, F. Yocum, J. H. Mayes, and D. A. Brown.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 069, Price codes: A05 in paper copy, A01 in microfiche. Report EPA-600/2-77-200, 1977. 84 p, 24 fig, 30 tab, 13 ref.

Descriptors: *Ammonia, *Metals, *Water pollution sources, *Distillation, Pilot plants, Carbon dioxide, Recycling, *Industrial wastes, Waste water treatment, Standards.

Seven ammonia plants were investigated for process condensate contaminant content and selected treatment techniques. Samples from each stream were analyzed for ammonia, methanol, and carbon dioxide. Metal analysis was performed for copper, nickel, iron, zinc, and chromium concentrations. Average values for contaminants were: ammonia, 873 mg/liter; methanol, 524 mg/liter, and carbon dioxide, 1809 mg/liter. Steam stripping was evaluated for the removal of ammonia from process condensate. Steam stripping bench tests and plant evaluations indicated that the method was a viable process for the reduction of ammonia and methanol in ammonia process condensate streams and will achieve EPA established guidelines. In the commercial unit evaluated, it was possible to strip the condensate and recycle the bottoms to the boiler feedwater system. The bottoms could be used for cooling towers make-up without further treatment. Trace metal levels in the condensate did not present a problem in the recycle of bottoms. Stripping the process condensate and injecting the vapor into the reformer stack was a successful control technology for reducing the amount of ammonia and methanol discharged to the environment. MUNICIPAL WATER POLLUTION CONTROL ABSTRACTS: NOVEMBER 1976-OCTOBER 1977,
Franklin Research Center, Philadelphia, PA.
J. G. Kutcher, and R. P. Kramer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 995, Price codes: A99 in paper copy, A01 in microfiche. Report EPA-600/9-77-037, 1977. 718 p.

Descriptors: *Waste water treatment, *Municipal wastes, *Abstracts, Water quality, *Water pollution, *Sewage treatment, Treatment facilities, Analytical techniques, Hydrology, Model studies, Sewers, Waste disposal, Indexing, Documentation, Cities.

This current awareness abstracting bulletin contains 1320 abstracts on methods of municipal waste water treatment, water quality problems, and water pollution control. The abstracted literature appeared in print during 1976-1977 and included the topics of: storm runoff, sewer systems, patents,

treatment methods, analytical techniques, model studies, hydrologic aspects, and miscellaneous data relating to water quality and pollution control. Also included is information on analytical techniques for water quality measurement; biological, chemical, and physical methods of waste water treatment, disposal, and recycling; construction and equipment for pollution control; mathematical, statistical, and simulation model studies; storm runoff; tunnelling technology and sewer systems; and treatment plant operation and automation. The report also includes a journal list, and subject and author indices. (Lisk-FRC)

PHOSPHORUS REMOVAL FROM HUMAN WASTEWATER BY DIRECT DOSING OF ALUM TO A SEPTIC TANK,
Ontario Ministry of the Environmental, Toronto. Applied Sciences Section.
M. Brandes.
Report of the Ministry of the Environment-Ontario, 1976. 49 p, 6 fig, 9 tab, 35 ref, 1 append.

Descriptors: *Septic tanks, *Domestic wastes, *Chemical precipitation, *Phosphorus, *Sludge, Nutrient removal, Chemical reactions, Waste water treatment.

Automatic dosing of alum to a two compartment septic tank was evaluated as a means of precipitating phosphorus. The system was designed to add alum in a measured dose to the septic system with each toilet flush; the septic tank received only toilet wastes. The phosphorus concentration in the tank before dosing was 19.6 + or - 0.5 mg/liter as P. Alum was added to the tank at an alum to phosphorus ratio of about 2. At this rate, the phosphorus concentration was reduced by 96.3% to about 0.72 mg/liter. Dissolved phosphorus levels decreased to 0.13 mg/liter. Although sulfates in the effluent increased with alum treatment, concentrations were below those acceptable for drinking water. Precipitation in the tank caused by alum dosing increased the rate of sludge accumulation from 62.0 liters/person/year to 146.0 liters/person/year. However, the time period in which sludge would reach permissable levels in the tank would not be less than 4.4 years. The alum dosing system was considered simple and cost effective in areas with high water tables or in systems located on bedrock or near to receiving waters. (Lisk-FRC)

OVERLAND FLOW IN THE LOUISIANA COASTAL ZONE; THE POTENTIAL FOR LAND TREATMENT OF WASTE WATER ON DIKED DREDGED SPOIL DISPOSAL SITES IN SOUTH LOUISIANA,
Louisiana State Univ., Baton Rouge. Center for Wetland Resources.
M. Meo, J. W. Day, and T. B. Ford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 327, Price codes: A04 in paper copy, A01 in microfiche. Report, 1975. 59 p, 7 fig, 16 tab, 36 ref.

Descriptors: *Waste water treatment, *Land use, *Application methods, *Pilot plants, *Organic matter, Louisiana, Municipal wastes, Industrial wastes, Carbon, Phosphorus, Nitrogen, Performance, *Overland flow.

Land treatment of organic waste water through overland flow is discussed as an effective and economical means of dealing with increased waste loads while achieving federally mandated water quality criteria. A pilot plant project in an enclosed marsh area in Dulac, LA, using effluent from a menhaden processing plant found overland flow to be an effective secondary treatment method, and in some cases, an effective tertiary treatment method. Primary treated organic waste was sprayed at a low rate on a naturally vegetated slope. The soil-plant system removed 85% of total organic carbon, 53% total phosphorus, and 51% total nitrogen. Overland flow is well suited to coastal Louisiana needs because of the soil type, high water table, long growing season, and the nature of organic wastes (fish processing and canning wastes, sugarcane processing wastes, and municipal sewage wastes). There are many possible agricultural and aquaculture applications in the region. (Small-FRC)

DRAFT ENVIRONMENTAL IMPACT STATEMENT, CITY OF JACKSONVILLE, FLORIDA, WASTEWATER MANAGEMENT FACILITIES, ARLINGTON-EAST SERVICE DISTRICT.
Environmental Protection Agency, Atlanta, GA. Region IV.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 591, Price codes: A21 in paper copy, A01 in microfiche. Report EPA 904/9-75-006, 1975. 433 p, 67 fig, 60 tab, 75 ref, 11 append.

Descriptors: *Environmental effects, *Municipal wastes, *Treatment facilities, *Construction, *Highway effects, Waste water treatment, Activated sludge, Odor.

The proposed sewage treatment facilities for Arlington-East are described and their environmental impact is evaluated. The proposed plant will have an initial capacity of 10 mgd and an ultimate capacity of 25 mgd. The waste water will be treated by screening, preaeration, grit removal, primary settling, activated sludge aeration, secondary settling, sludge return facilities, and effluent chlorination. Treated plant effluent will be discharged into the St. Johns River. Construction impacts include loss of wildlife habitat, short-term impacts such as dust, noise, traffic, and soil erosion, and short-term disruption of two acres of salt marsh. Operational impacts include discharge of treated waste water into the river, and operational noise and odor. Secondary impacts include the potential for development of areas set aside for preservation and conservation with associated potential needs for water supply, transportation, recreation areas, and other community facilities. PERFORMANCE EVALUATION OF KILMICHAEL LAGOON,
Mississippi State Univ., Mississippi State. Coll. of Engineering.
D. O. Hill, and A. Shindala.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 927, Price codes: A11 in paper copy, A01 in microfiche. Report EPA-600/2-77-109, 1977. 220 p, 23 fig, 12 tab, 3 append.

Descriptors: *Municipal wastes, *Sewage lagoon, *Performance, *Suspended solids, *Biochemical oxygen demand, Seasonal, Algae, Standards, Design, Coliforms, Disinfection.

A three-cell facultative lagoon at Kilmichael, Mississippi was evaluated from the point of view of design criteria and secondary treatment standards for municipal facilities. Performance varied by day and by season; thus, the facility did not consistently meet standards. Total BOD was generally less than 30 mg/liter. Soluble BOD was consistently less than 10 mg/liter. Suspended solids were consistently outside secondary limits and contributed the major portion of the total BOD. Also, suspended solids were responsible for the daily and seasonal variations. An effective algae removal technique could result in excellent, consistent lagoon performance. Fecal coliform determinations were consistently higher than an MPN of 200/100 ml. An appropriate disinfection system is needed to protect the receiving water. (Small-FRC)
W79-07068

PERFORMANCE EVALUATION OF AN EXISTING LAGOON SYSTEM AT EUDORA, KANSAS,
Kansas Univ., Lawrence. Dept. of Civil Engineering.
R. E. McKinney.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 653, Price codes: A11 in paper copy, A01 in microfiche. Report EPA-600/2-77-167, 1977. 231 p, 1 fig, 42 tab, 3 ref, 1 append.

Descriptors: *Suspended solids, *Municipal wastes, *Sewage lagoons, *Performance, *Algae, Standards, Nutrients, Nitrogen, Phosphorus, Coliforms.

The performance of waste water lagoons at Eudora, Kansas, were evaluated for one year. The lagoons consisted of three cells placed in series. Raw waste water characteristics were normal for a small residential community, and the lagoons produced typical results. The lagoons could not meet EPA effluent criteria for secondary treatment because of excessive suspended solids in the final effluent. The high suspended solids were primarily due to living and dead algae. Most of the waste organic stabilization took place in Cell 1 with algae recycling nutrients in Cell 2 and Cell 3. Recycling of nutrients by algae results in a slow but steady reduction of nitrogen and phosphorus in the lagoons. Temperature had the greatest influence on the growth and predomination of various species of bacteria and the die-off of fecal coliform bacteria. Removal of the suspended solids would result in meeting EPA effluent criteria. (Small-FRC)

INVESTIGATION INTO THE APPLICATION OF PHYSICO-CHEMICAL PROCESSES FOR MUNICIPAL WASTE-WATER TREATMENT (ONDERZOEK NAAR DE TOEPASSINGSMOGELIJKHEDEN VAN FYSISCH-CHEMISCHE PROCESSEN VOOR DE ZUIVERING VAN HUISHOUDELIJK AFVALWATER),
F. Bloot, C. J. Duyverman, B. A. Heide, P. J. F. van der Most, and A. van Vliet.
Available from the National Technical Information Service, Springfield, VA 22161 as N77-24013, Price codes: A05 in paper copy, A01 in microfiche. Report, 1975. 92 p, 15 fig, 16 tab, 45 ref, 1 append.

Descriptors: *Flocculation, *Coagulation, *Chemical precipitation, *Nutrient removal, *Activated carbon, Biological treatment, Adsorption, Aeration, Calcium hydroxide, Chemical oxygen demand, Disinfection, Reverse osmosis, Capital costs, Waste water treatment, Municipal wastes.

Physico-chemical treatment of municipal waste water was evaluated as an alternative to biological treatment. The sequence of physico-chemical treatment of waste water comprises the process stages: mechanical pretreatment for the removal of solids and sand; coagulation/flocculation to remove colloidal particles or to remove phosphates with calcium hydroxide; aeration through an alkaline liquid to remove ammonia; recarbonation to convert calcium hydroxide to calcium carbonate followed by carbonate removal by adjusting the pH to 7; activated carbon adsorption of COD, and regeneration of the carbon. The waste water may be rendered potable by further disinfection and demineralization by reverse osmosis. Pilot plant studies of physico-chemical treatment have indicated that effluent quality expressed in terms of COD and Kjeldahl-nitrogen was not significantly different than effluent from biological treatment. At effluent outputs of about 20,000 cu m/day, physico-chemical treatment capital costs were lower than a comparable biological treatment system; variable costs, such as energy requirements, are higher for physicochemical treatment. This treatment was considered more suitable for treating waste waters which are toxic to biological systems. Physico-chemical treatment may be used in conjunction with biological treatment for removal of COD, metals, and salts; where waste water is to be reused as industrial or drinking water; or when biological systems are overloaded. (Lisk-FRC)

NITRATE REMOVAL IN CLOSED-SYSTEM AQUACULTURE BY COLUMNAR DENITRIFICATION,
Rhode Island Univ., Kingston. Dept. of Microbiology.
W. L. Balderston, and J. Sieburth.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 166, Price codes: A02 in paper copy, A01 in microfiche. Report NOAA-77041526, 1976. 5 p, 3 fig.

Descriptors: *Denitrification, *Salmonids, *Monitoring, *Waste water treatment, *Agriculture, Ammonia, Sulfides, Carbon, Nitrite, Aquatic bacteria.

The columnar denitrification of nitrate-nitrogen removal from high-density, closed system, salmonid aquaculture was investigated. Adequate chemical monitoring was necessary for the optimization and quality control of this method. When methanol-carbon was not balanced with inlet nitrate-nitrogen, the column effluent was unsatisfactory for closed-system fish culture because of the presence of excess amounts of nitrite, ammonia, sulfide, and dissolved organic carbon. Column naturity and residence time also influenced sulfide production. Methane-carbon was unsatisfactory as an exogenous carbon source, and endogenous carbon did not support high removal efficiencies. Freshwater columns adapted readily to artificial seawater with a salinity of 18 o/oo without observable inhibition. Scanning electron microscopy determined that bacterial flora was mainly rod forms with the Peritricha (protozoa) as the primary consumers. Denitrifying bacteria isolated from freshwater columns were tentatively identified as species of Pseudomonas and Alcaligenes. In a pilot plant column, nitrate production was not observed. (Small-FRC)

PILOT PLANT INVESTIGATIONS OF SECONDARY SLUDGE DEWATERING ALTERNATIVES,
National Council for the Paper Industry for Air and Stream Improvement, Inc., Kalamazoo, MI.
R. A. Miner, D. W. Marshall, and I. Gellman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 982, Price codes: A07 in paper copy, A01 in microfiche. Technical Report EPA-600/2-78-014, 1978. 127 p, 26 fig, 32 tab, 8 ref, 5 append.

Descriptors: *Dewatering, *Sludge treatment, *Pulp wastes, *Filtration, *Centrifugation, *Performance, Separation techniques, Industrial wastes, Activated sludge, Waste water treatment.

Biological sludge thickening and dewatering alternatives were investigated on waste activated sludge resulting from the treatment of waste water from an integrated bleached kraft fine paper mill. Dewatering alternatives included pressure filtration, precoat vacuum filtration, filter belt pressing, capillary suction dewatering, gravity filtration, centrifugation, and ultrafiltration. Three levels of performance were indicated. First, pressure filtration and precoat vacuum filtration generated the driest cakes. Filter bed pressing yielded intermediate cake consistencies. Gravity filtration, centrifugation, and ultrafiltration resulted in relatively low cake consistencies. Performance was severely affected by changes in feed sludge consistency, the amount of sludge conditioning, and the sludge's specific resistance to filtration. The type and amount of sludge conditioning required was extremely variable, depending upon the dewatering technique employed, the level of performance expected, and the consistency and nature of the sludge being dewatered.

MEMBRANE PROCESSING OF COTTAGE CHEESE WHEY,
Cornell Univ., Ithaca, NY. Dept. of Food Science.
R. R. Zall.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 251, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-77-118, 1977. 114 p, 25 fig, 10 tab, 6 ref, 9 append.

Descriptors: *Reverse osmosis, *Filtration, *Dairy industry, *Biochemical oxygen demand, *Membrane processes, Membranes, Separation techniques, Proteins, Cleaning, Industrial wastes, Waste water treatment.

A two-step ultrafiltration and reverse osmosis system processes 300,000 lbs/day of cottage cheese whey. Semipermeable cellulose acetate membranes operate as molecular sieves to remove proteins and lactose from the whey. The treatment process reduces effluent BOD from 40,000 mg/liter to about 2,000 mg/liter. Reverse osmosis permeate may be used to clean the whey plant when biological contaminants are adequately controlled. The system was found difficult to clean and sterilize with certain enzyme cleaners and sanitizers used. Costs for operating the plant were estimated to be about $220,000; costs for cleaners were $22,800 more than originally estimated while membrane replacement required an additional $39,600. Membranes failed more rapidly when overly exposed to or stored in sanitizing solutions and chlorinated sanitizers were harsher to membranes than quaternary ammonium compounds. The life expectancy of ultrafiltration membranes appeared to be one year rather than two while reverse osmosis membranes lasted two years. Simplification of the reverse osmosis hardware, strengthening of the ultrafiltration process, and identification of less costly cleaning methods were recommended. (Lisk-FRC)

EXTRACTION OR DESTRUCTION OF CHEMICAL POLLUTANTS FROM AQUEOUS WASTE STREAMS,
Texas A and M Univ., College Station.
R. R. Davison.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 935, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-148, 1977. 58 p, 12 fig, 11 tab.

Descriptors: *Industrial wastes, *Waste water treatment, *Ozone, *Solvent extractions, *Organic compounds, Costs, Color, Odor, Performance, Volatility.

Solvent extraction and ozonation were used to treat various industrial waste waters. The industrial wastes were primarily light chlorinated hydrocarbon solvent wastes which were generally extracted with a high molecular weight paraffin petroleum fraction. Distribution data was also obtained on pure chlorinated compounds. The economics of solvent extraction versus steam stripping was investigated. Chlorinated solvents could be effectively removed by extraction, but stripping was more economical. Solvent extraction can compete with stripping when water solubility is higher and the volatility lower than usually encountered in such wastes. Toluene diamine can be extracted with benzene and the benzene can be steam stripped from the water. Ozone is not effective in treating glycol wastes, and it removes color and odor more rapidly than it removes TOC. The cost of treatment with ozone decreases with decreasing organic load, and the efficiency of ozone utilization decreases. (Small-FRC)

WASTEWATER FILTRATION DESIGN CONSIDERATIONS,
Environmental Protection Agency, Cincinnati, OH. Office of Technology Transfer.
J. L. Cleasby, and E. R. Baumann.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 448, Price codes: A03 in paper copy, A01 in microfiche. Report EPA/625/4-74/007, 1974. 40 p, 12 fig, 4 tab, 23 ref.

Descriptors: *Filters, *Coals, *Silica, *Sands, *Design criteria, Tertiary treatment, Granules, Particle size, Head loss, Hydraulic design, Suspended solids, Filtration, Flow rates, Waste water treatment, Municipal wastes.

Filter configurations, flow controls, filter media, backwashing requirements, and head-loss developments are reviewed for polishing secondary municipal waste water. Filter material utilized singly or in multimedia filters included anthracite coal (specific gravity, 1.35-1.75), silica sand (2.65), and garnet sand (4-4.2). Conclusions of the granular filter study for secondary effluent treatment included the consideration of variable hydraulic and suspended solids loads in the filter design to avoid short filter runs and excessive backwash water requirements; the provision of a coarse-to-fine filtration system, with influent-side filter media in the particle range 1-1.2 mm, to permit penetration of suspended solids; optimization of the backwash water flow rate for fluidization of the coarser-sized grains of media; agitation of the media with air scour or surface washers to insure proper backwashing; and consideration of the effects of recycling backwash water on the filtration rate and filter operation for predicting peak loads and run lengths. Other recommendations for controlling filtration rates and terminal headloss are made depending upon the characteristics of the waste water. (Lisk-FRC)

LAND APPLICATION OF WASTEWATER IN AUSTRALIA. THE WERRIBEE FARM SYSTEM MELBOURNE, VICTORIA,
Environmental Protection Agency, Washington, DC. Office of Water Program Operations.
B. L. Seabrook.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 454, Price codes: A03 in paper copy, A01 in microfiche. Report EPA-430/9-75-017, May 1975. 29 p, 2 fig, 3 tab, 7 ref.

Descriptors: *Overland flow, *Irrigation, *Oxidation lagoons, *Application methods, *Australia, Sewage lagoons, Grazing, Pasture management, Return flow, Cattle, Sheep, Treatment facilities, Waste water treatment, Municipal wastes.

The Werribee Farm in Melbourne, Australia, treats an average daily municipal waste water flow of 150 mgd with land treatment comprising land filtration, sedimentation, overland flow, and lagooning. The treatment system, in operation since 1897, cost about $1.53 per capita to operate in 1974. The land treatment system treats about 95% of the sewage from a population of 1,880,000. The farm incorporates a total area of about 27,000 acres and provides grazing land for 20,000 cattle and 10,000 sheep which have a net return of $675,000. About 38% of the sewage is treated by crop irrigation, 39% by overland flow, and 23% by oxidation lagoons. A conventional secondary mechanical treatment plant was constructed to handle about 45% of the sewage load to prevent overloading of the land treatment system. (Lisk-FRC)

ADVANTAGES AND DISADVANTAGES OF REGIONAL SEWERAGE SYSTEMS,
Rutgers - The State Univ., New Brunswick, NJ. Water Resources Research Inst.
W. Whipple, Jr.
Water Resources Bulletin, Vol. 14, No. 6, p 1449-1456, December 1978. 2 fig, 13 ref. OWRT A-048-NJ(7). 14-34-0001-8032.

Descriptors: *Sewerage, *Regional analysis, *Interceptor sewers, *Effects, *Streamflow, *Cost-effectiveness, Water quality, Land use, Planning, Urbanization, Regional development, Sewage disposal, Low flow, Sewage treatment, Pipelines.

A few years ago, many water quality administrators were convinced that large regional sewerage systems, consisting of one large treatment plant and long trunk sewers extending out to various communities, represented the only efficient and economical means of assuring water quality control. In communities favoring rapid development, the provision of sewer service and encouragement of development of new centers along the trunk sewers offered an additional advantage. More recently, quite different points of view have been arising in certain areas. In parts of New Jersey, strong environmental and community resistance has arisen to proposed central plant-trunk sewer systems. The facilitation of new development along the trunk sewers is viewed as a menace by townships not wanting intensive development of these areas. The diversion of effluent flows to trunk sewers rather than septic tanks would dry up the streams which water quality programs are supposed to protect. Both sides to the controversy have mobilized engineering, environmental, economic, and legal expertise and some critical policy issues have developed. Reconsideration of regional sewerage management and particularly trunk sewer policy is required. The decision as to extent of sewerage service areas involves complex and sensitive planning tissues. Because of potential conflicts of interest, such decisions should not be left to staffs of sewerage authorities and their design engineers. (Bell Graf-Cornell)

RESPONSE OF HALEY POND, MAINE, TO CHANGES IN EFFLUENT LOADS,
Maine Dept. of Environmental Protection, Augusta.
J. H. Bailey, M. Scott, D. Courtemanch, and J. Dennis.
Journal of the Water Pollution Control Federation, Vol. 51, No. 4, p 728-734, April 1979. 10 fig, 14 ref.

Descriptors: *Lakes, *Eutrophication, *Phosphorus, Nutrients, Waste water treatment, Effluents, Algae, Chlorophyll, Secchi disks, Sampling, Water quality, Hydrogen ion concentration, Alkalinity, Dissolved oxygen, Temperature, Biota, Phytoplankton, Benthos, Water quality control, Water pollution control.

When, in 1970, a secondary wastewater treatment plant began discharging effluent to Haley Pond, the lake underwent rapid eutrophication. Mean phosphorus concentration in lake water increased from 9 to 30 micrograms/liter, mean Secchi disk transparency decreased from 3.0 to 2.3 m, and intense blue-green algal blooms developed. Initiation of tertiary wastewater treatment for phosphorus removal in 1975 reduced effluent loading 97%. This quickly reversed the eutrophication, and within 2 years lake water quality approached predischarge conditions. The response of the lake to changing phosphorus loading was compared with the response predicted by a simple mass balance model, and changes in the biota during this period were documented. FLOTATION OF INDUSTRIAL EFFLUENTS,
Marks, Dawes, Tait and Associated, Cape Town (South Africa).
R. H. Marks, and R. J. S. Thurston.
CHEMSA, Vol. 4, No. 9, p 137 and 139, September 1978. 4 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Effluents, *Flotation, Water pollution treatment, Water purification, Water quality control, Bubbles, Economics, Equations, Pressure, Velocity, Liquid wastes.

Flotation is the use of bubbles to separate finely dispersed, suspended matter close in density to that of the carrying liquid. Three types of flotation systems are used in effluent treatment: dispersed air, dissolved air, and electrolytic flotation. Dispersed air involves the introduction of gaseous air into the effluent stream by an impeller or turbine. Because these systems produce a comparatively large sized bubble, they have been found less effective than other systems. They are used only with hydrophobic materials. Air bubbles in the dissolved air system are generated by releasing the pressure on a separated, pressurized solution of air in water dissolved into either the main effluent stream or a recycle stream of treated effluent. Since these bubbles are generally much smaller than those formed by the dispersed air method, they are more efficient in flotation. The disadvantages of this system are their relatively high power consumption and the necessary maintenance of the compressors. The electrolytic generation of hydrogen and oxygen bubbles in water exhibits a slightly higher solids removal efficiency than the other two methods. Due to the absence of turbulence, the electroflotation system is highly compatible with fragile flocs. Capital costs and general maintenance for small sized plants are lower than for the other two systems. (Davison-IPA)

ROUTINE CONTROL OF BILHARZIA IN IRRIGATION SYSTEMS,
De Beers Diamond Research Lab., Hohannesburg (South Africa).
A. C. Evans.
The Rhodesia Science News, Vol. 12, No. 4, p 92-98, April 1978. 5 fig.

Descriptors: *Waste water treatment, *Animal parasites, *Epidemiology, *Bilharzia, *Human diseases, Dams, Drainage, Impounded waters, Weirs, Molluscicides, Snails, Water pollution sources, Water pollution treatment, Infection, Southern Africa.

The efficacy of bilharzia control methods was evaluated from studies on snail population in treated and untreated dams and data on the incidence of the disease among children on Triangle Estate and Hippo Valley Estate. Storage dams and drainage water on irrigation systems provide ideal habitats for two species of snail serving as the intermediate hosts for bilharzia. Two methods at molluscicidal application and the subsequent surveillance of drains and streams are described. Parasitological assessments reveal: (1) disease transmission is seasonal with the highest incidences occurring in the rainy to post rainy periods; (2) infection rates were lower in winter months; (3) transmission of S. mansoni was definitely linked to contact with stream courses; and (4) incidence rates were higher in villages sited close to streams. The evidence accumulated to date shows that routine snail control programs can reduce the incidence, prevalence and intensity of the infection within two years. It is concluded that each area requires its own appraisal and control program developed to suit specific conditions. (Davison-IPA)

MONITORING OF THE EFFLUENT STREAM FROM WASTEWATER TREATMENT PLANTS,
National Environmental Research Center, Cincinnati, OH. Advanced Waste Treatment Research Lab.
R. Smith.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 393, Price codes: A02 in paper copy, A01 in microfiche. Report, 1971. 12 p, 2 fig, 1 tab.

Descriptors: *Evaluation, *Water pollution sources, *Analytical techniques, *Waste water treatment, Flow, Hydrogen ion concentration, Suspended solids, Temperature, Organic matter, Biochemical oxygen demand, Costs.

The number of measurements required to evaluate the quality of the effluent stream from a waste water treatment plant depend on the degree of precision required. Ideally, all measurements should be made on-line 24 hr/day and 365 days/yr. A minimum set of measurements which will characterize effluent with respect to impact on the receiving stream is: volume flow (mgd), water temperature, pH, suspended solids (mg/liter), and total organic concentration (COD, TOC, TOD, TC). A measurement of 5-day BOD can be substituted for total organic concentration. Instrumentation for the various measurements is discussed. When flow, water temperature, and pH are measured automatically and wet chemistry laboratory methods are used to determine COD, BOD, and suspended solids, the construction costs would be $34,361 for a 1 mgd plant and $100,111 for a 100 mgd plant. LEACHABILITY OF RADIOACTIVE CONSTITUENTS FROM URANIUM MINE TAILINGS STATUS REPORT (JUNE, 1974 TO JANUARY, 1977),
Environmental Protection Service, Burlington (Ontario). Waste Water Technology Center.
D. N. Bryant, D. B. Cohen, and R. W. Durham.
Technology Development Report EPS 4-WP-79-4, April 1979, 32 p, 13 fig, 6 ref, 8 tab.

Descriptors: *Uranium radioisotopes, *Tailwater, *Mine drainage, *Leaching, *Leachate, Radioactive waste, Sewage sludge, Effluents, Lysimeters, Settling basins, Planting management, Radiochemical analysis, Conductivity, *Acrylic lysimeters, *Polyethylene lysimeters.

A project using lysimeters to determine the leaching of radioactive constituents from abandoned uranium mine tailings, and BaRaSO4 sediments from these tailings was initiated at the Wastewater Technology Centre, Burlington, Ontario. Lime addition to the surface of acidic abandoned tailings did not reduce the level of radioactive constituents in the leachate. Considerable increases in levels of the radionuclides 230Th, 232Th and 228Th, as well as gross alpha and beta activity in the leachate, occurred five months after recycling of BaRaSO4 sediments to the surface layers of abandoned tailings. After nine months of leaching, the levels of 226Ra in the leachate were 30 percent greater from the tailings plus sediment treatment than from tailings only (control). The project was revised by increasing the high water application rate from 82 mm per month to a continuous flow of about 460 mm per month. From data obtained to date, recycling of BaRaSO4 sediments resulting from the treatment of acid seepage from abandoned tailings would appear to be undesirable because high thorium and other radioactive constituents in drainage water would require continuous treatment indefinitely. APPLICATION OF THE ATP ASSAY FOR MONITORING THE DISINFECTION OF WASTEWATER STREAMS,
Dearborn Chemical Co. Ltd., Ottawa (Ontario). Dearborn Environmental Consulting Service.
J. E. Cairns, S. G. Nutt, B. K. Afghan, and D. B. Carlisle.
Inland Waters Directorate, Water Quality Branch, Environment Canada, Ottawa, Canada, 1979, 18 p, 2 fig, 13 ref, 4 tab.

Descriptors: *Industrial plants, *Waste water treatment, *Chlorination, *Effluents, *Coliforms, Suspension, Analytical techniques, Biological treatment, Disinfection, Cultures, Nutrients, Poisons, Metabolism, *Adenosine triphposphate(ATP), *Plate count tests.

Plate count tests and ATP (adenosine triphosphate) assays were conducted on the following: water from waste treatment plant effluents chlorinated in the laboratory, water from waste treatment plants chlorinated by the plant facilities, and bacterial suspensions (prepared from laboratory cultures isolated from waste treatment plants) chlorinated in the laboratory. Both ATP levels and plate counts decreased in proportion to the amount of chlorine added to the water. However, the response of ATP and plate counts to the application of chlorine differed by several orders of magnitude. Despite reductions in the plate count parameters in excess of five logs (greater than 99.999%), a significant amount of the ATP was recovered in the chlorinated samples. Furthermore, the relatively insensitive response of the ATP parameter to chlorine occurred even when all the species in the sample should have been capable of growing on

the plate count media before chlorination. According to their response to nutrients and metabolic poisons, chlorinated cells which contain ATP, but are not measured by plate counts, can be metabolically active. Experiments in which chlorinated and unchlorinated cells were treated with proflavine suggest that the lethal action of chlorine, at the dosages studied, can be a site affecting DNA synthesis. An assay based on ATP techniques to measure the ability of microorganisms to attach surfaces was developed. This assay responded more sensitively to chlorination than assays of the total ATP levels of the sample. It is concluded that the ATP assay can be a useful tool in monitoring and controlling the disinfection of biological systems. (WATDOC)

DISINFECTION OF POULTRY PACKING PLANT EFFLUENTS SALMONELLA.
Dearborn Chemical Co. Ltd., Ottawa (Ontario). Dearborn Environmental Consulting Services.
Water Pollution Control Directorate, Environmental Protection Service, Environment Canada, Ottawa, Canada, Economic and Technical Review Report EPS 3-WP-78-9, December 1978, 152 p, 9 fig, 52 tab, 8 ref, 3 append.

Descriptors: *Salmonella, *Disinfection, *Poultry, Industrial production, Industrial wastes, Waste water treatment, Chlorination, Ozone, Toxicity, Fish, Design, Operations, Operating costs, Laboratory tests, On-site tests, *Ontario, *Dechlorination.

This report is the result of an investigation to compare the relative effectiveness and economics of chlorination and ozonation for the control of salmonella in poultry processing effluents. The findings are based on laboratory and field studies conducted on the effluents from three poultry processing plants in Ontario. The surveys also were designed to assess the effect of plant design and operation on the incidence of salmonella in the final effluent. The results indicated that none of the existing treatment systems eliminated the salmonella organisms. In one instance where the processor discharged to a municipal sewer system, salmonella were isolated in anaerobically digested sludge. Chlorination and ozonation proved effective in controlling salmonella under both winter and summer operating conditions. Chlorination, however, was used successfully at a substantially lower concentration and marginally lower contact time. Chlorination increased the toxicity of the discharged effluent to fish, making dechlorination procedures necessary. Although these results were conclusive, the report indicates that disinfection requirements were site-specific. The operating costs, including amortization of capital, for ozonation were estimated at $0.17 per 1,000 1gal ($0.04 per cu. m), compared to chlorination-dechlorination costs of $0.054 per 1,000 1gal ($0.01 per cu. m). SINGLE SLUDGE NITROGEN REMOVAL SYSTEMS,
Environmental Protection Service, Burlington (Ontario). Waste Water Technology Center; and McMaster Univ., Hamilton (Ontario).
P. M. Sutton, B. E. Jank, B. A. Monaghan, and K. L. Murphy.
Canada-Ontario Agreement on Great Lakes Water Quality, Ontario Ministry of the Environment, Toronto, Ontario, Canada, Research Report No. 88, 164 p, 3 app, 33 fig, 63 ref, 19 tab. 1979. 75-3-21.

Descriptors: *Nitrogen, *Nitrogen fixation, *Denitrification, *Waste water treatment, *Activated sludge, Aerobic bacteria, Phosphorus, Effluents, Alkalinity, Pilot plants, Analysis.

The need for nitrogen control in the treatment of wastewater has been well documented in numerous reports and papers. Rational design approaches have been developed for nitrification in combined and separate activated sludge systems and for denitrification in separate sludge systems receiving an external carbon and energy source. Recent attention has been focused on single sludge systems which combine the processes of carbon oxidation, nitrification, and denitrification in one or more reactors without intermediate clarification and with or without the addition of an external carbon source. In this study, five different single sludge process configurations were studied at the pilot scale level. The effects of temperature, the aerobic to anoxic retention time ratio, the organic and inorganic loading conditions, the influent wastewater carbon to nitrogen ratio, and various other factors influencing nitrification and denitrification in single sludge systems were examined. The results indicate that the critical factor affecting nitrification in single sludge systems is the aerobic solids retention time. The temperature influence upon nitrification in aerobic-anoxic systems and in purely aerobic systems appears to be comparable. The denitrification rates in single sludge systems will depend on whether the reaction proceeds under noncarbon limiting or carbon limiting conditions. The organic carbon requirements in single sludge and separate sludge post-denitrification systems, to ensure no carbon limitation on the denitrification rate, are similar. (WATDOC)

TREATMENT OF BASE METAL MINE DRAINAGE AT PILOT SCALE,
Environmental Protection Service, Ottawa (Ontario). Water Pollution Control Directorate.
P. M. Huck, and B. P. LeClair.
Technology Development Report EPS 4-WP-78-4, July 1978, 80 p, 7 fig, 19 tab, 22 ref.

Descriptors: *Metals, *Mine drainage, *Sludge treatment, *Pilot plants, Lime, Neutralization, Dewatering, Effluents, Toxicity, Separation techniques, Lethality, Salmonids, *Northeastern New Brunswick.

The suitability of conventional precipitation and sedimentation techniques to remove lead, zinc, copper and iron from various types of acid mine drainage in Northeastern New Brunswick was investigated at pilot scale. The 0.3 to 1.0 L per S (4 to 13 1gpm) pilot plant was designed for lime and polymer addition, flocculation, clarification, filtration and sludge recycle. Optimum operating ranges were determined for the individual unit processes and data on attainable levels of extractable and dissolved metals are presented. Experiments were also conducted to compare two-stage lime neutralization to single stage neutralization and to investigate sludge dewaterability and effluent toxicity. Average extractable metal levels attained as clarifier overflow concentrations were 0.25 mg per L lead, 0.36 mg per L zinc, 0.05 mg per L copper and 0.28 mg per L iron. Further reductions were achieved by sand filtration. Dissolved metal levels in the clarifier overflow were approximately equal to extractable metal levels and were unaffected by further polishing. No performance advantages were discerned using two-stage neutralization compared to single stage. Sludge recycle proved to be an effective technique to increase clarifier sludge density. Sludge dewatering tests indicated that the sludge could be effectively dewatered by vacuum or pressure filtration. Bioassay tests showed median lethal times for salmonid test fish to be consistently in excess of 96 hours (the maximum period) provided that the pH was adjusted to near neutral values before tests were conducted. NITRIFICATION-DENITRIFICATION OF WASTEWATER USING A SINGLE-SLUDGE SYSTEM VOLUME 1,
Ontario Ministry of the Environment, Toronto.
A. G. Smith.
Canada-Ontario Agreement on Great Lakes Water Quality, Training and Technology Transfer Division (Water), Environmental Protection Service, Fisheries and Environment Canada, Ottawa, Canada, Research Report No. 86, 75 p, 2 app, 15 fig, 5 photographs, 17 ref, 11 tab. 1978. 71-1-20.

Descriptors: *Nitrification, *Denitrification, *Waste water treatment, Sludge digestion, Phosphorus, Aeration, Effluents, Suspended solids, Pilot plants, Nutrient removal, Sampling, Analysis, *Ontario.

Full-scale nitrification-denitrification of wastewater was conducted at the Newmarket, Ontario, Water Pollution Control Plant (WPCP), where primary stage lime treatment for phosphorus removal was being applied. The secondary treatment section was divided into two separate units, one for nitrification and the other for single-sludge nitrification-denitrification. For nine months, fall to spring, the units were evaluated under ambient environmental conditions using, for the most part, on-site equipment. The object of this study was to see what degree of nitrification-denitrification could be maintained within a system with lime treatment. Experiments involved denitrification mixed liquor thickening, methanol dosing and supplementary iron salt addition for phosphorus removal. Constant high (above 200 ml per g) sludge volume index (SVI) was experienced in both the nirification and combined nitrification-denitrification units at Newmarket. This was thought to be caused by lime addition to the primary stage. Full nitrogen conversion and removal were disrupted by sludge chlorination for SVI control. Some limitations of the conventional facility were also found to affect nitrogen removal. Supplemental addition of ferrous sulphate, late in the program, to the aeration basin improved phosphorus removal and decreased SVI. (WATDOC)

WHEN WATER IS THREATENED,
The Civil Engineering Contractor, Vol. 12, No. 12, p 37 and 39, September 1978. 2 fig.

Descriptors: *Water resources development, *Planning, *Rhodesia, *Dams, Riparian rights, Watersheds(Basins), Legal aspects, International, Water consumption, Water resources, Rainfall, Water storage, Storage capacity, Water yield, Water yield improvement.

Water development is a carefully planned priority in Rhodesia, a small land-locked country where the major rivers are contiguous with alien lands, or arise in one territory and flow through Rhodesia into another. Rhodesian water legislation is based on maintaining full control over the development of water resources for Rhodesian benefit, while respecting neighboring interests by providing for consultation with co-riparian states for planned development. The annual population growth rate of 3.6% necessitates careful planning, with catchment planning as the objective. Water resources are derived entirely from the annual rainfall which occurs during a few months. The existing 7,200 major and lesser dams provide a storage capacity of 3.6 x 10 to the ninth cubic meters. Long term hydrological data is being obtained from 470 recorder installations in main rivers. Large dam sites are being developed to the optimum storage capacity within the limitations of the physical features of the site and catchment yield. Currently the Ministry of Water Development has selected 310 large dam sites and developed plans for 85; 90 large dams have already been constructed. Storage capacity requirements for the turn of the century have been forecast at approximately 16 x 10 to the ninth cubic meters, or about half the optimum storage capacity required to develop the full esti-

mated potential yield of the country's water resources. Rhodesia's maximum utilization of storage/yield is 50% compared to the 80 to 100% for the U.S., Australia, and Iraq. (Davison-IPA)

POLLUTION FROM AGRICULTURAL AND FOOD INDUSTRIES,
Energy, Vol. 4, No. 4, p 20-21, April/May 1978.

Descriptors: *Waste water treatment, *Water reuse, *Water pollution treatment, *Food processing industry, *Waste treatment, Effluents, Anaerobic digestion, Aerobic treatment, Activated sludge, Waste treatment plants, Microbial degradation, Biodegradation, Sludge digestion, Wastes, Water pollution sources, Industrial wastes, Liquid wastes, Organic wastes, Organic matter, Organic compounds, Water pollution.

The volume and quantity of pollution from the agricultural and food industries varies according to the type of activity, production process, tonnages involved, the season, and even the day and time of day. The effluent, essentially organic in composition often has a high DCO and DBO5 content. The known waste treatments must be adopted to the individual segments of the agricultural and foodstuffs industries. Water recycling techniques have been intensively studied in France in recent years, and a number of plants are effectively treating waste water for internal reuse. The Adour-Garbonne basin authorities report a 60% reduction in the amount of water to be treated from a cooked meat and vegetable preserving plant. The increase of large scale food production units over the last 15 years has necessitated the construction of purification stations for their effluents. These purification stations generally utilize microbial degradation in the form of aerobic treatment or anaerobic digestion. The performance of these stations varies with the material and the number of recycling operations used; efficiency ranges between 40 and 65% for heavy and medium loads. Difficulties encountered in separating the bacterian agglomerates of processed water by simple decantation are known as 'festering expansion' of the activated sludge. Research on these difficulties and the techniques of operating purification stations has been carried out by the Institut National de la Lecherche Agronomique. (Davison-IPA)

THE 'BIOPOT' -- GOOD RURAL HYGIENE,
Development Magazine, Vol. 12, No. 14, p 43, June 1978. 1 fig.

Descriptors: *Waste treatment, *Biodegradation, *Aerobic treatment, *Anaerobic digestion, Filters, Neutralization, Calcium carbonate, Pollution abatement, Organic wastes, Odor, Air pollution, Rural areas, Waste disposal.

A closed lavatory system is described which reportedly does not contaminate groundwater, the soil or the air, and requires no transportation of the wastes. Two stages of biochemical treatment are involved: aerobic decomposition and an anaerobic decomposition and an anaerobic process which eliminates dangerous microorganisms. Because the main treatment is a composting process and bulk household garbage can also be treated, a very concentrated rich manure is yielded. The 'biopot' is based on a filter system consisting of three layers: the first is coarse sand and leaves for trapping solid particles in the fluid; the second consists of crushed limestone and ashes to neutralize the acids; the third is coarse sand and charcoal to trap remaining organisms and particles. The filter is placed on a perforated stone slab which is a permanent part of the construction. The 'biopot' is designed for outlying and poor rural areas; its advantages are listed. (Davison-IPA)

DETERMINATION OF INORGANIC AND TOTAL MERCURY, IN WATER AND EFFLUENTS BY FLAMELESS ATOMIC ABSORPTION, (BEPALING VAN ANGORGANIESE EN TOTALE KWIK IN WATER EN ULTVLOEISELS DEUR VLAMLOSE ATOOMABSORPSIE,)
National Inst. for Water Research, Pretoria (South Africa).
D. J. Huyser, and R. G. Bohmer.
Water S. A., Vol. 4, No. 2, p 76-80, April 1978. 3 fig, 27 ref.

Descriptors: *Waste water treatment, *Spectrophotometry, *Flame photometry, *Mercury, *Absorption, *Water pollution sources, Sewage, Acids, Digestion, Temperature, Organic compounds.

The flameless, or cold vapor, method was used to determine inorganic and total mercury in water samples with varying amounts of pollution. Since not all methods for determining inorganic mercury can be applied to all types of water, special care must be taken with sewage samples. Recovery of mercury added to settled sewage was very low with the method used, even after varying quantities of different inorganic acids were added. The investigation of three digestion procedures for determining total mercury involved the use of varying quantities of oxidizing agents and acid and different digestion temperature and times. Results showed that oxidizing agent must be present; digestion must take place at high temperatures. (Davison-IPA)

TIOGA RIVER MINE DRAINAGE ABATEMENT PROJECT,
Gannett, Fleming, Corddry and Carpenter, Inc., Harrisburg, PA.
A. F. Miorin, R. S. Klingensmith, R. E. Heizer, and J. R. Saliunas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-293 507, Price codes: A03 in paper copy, A01 in microfiche. Report No. EPA-600/7-79-035, February 1979. 96 p, 28 fig, 21 tab, 4 ref, 2 append. S805784 (14010 HIN).

Descriptors: *Mine wastes, *Water pollution control, *Pollution abatement, *Mine drainage, *Strip mines, Sludge, Soil chemistry, Acid mine water, Limestones, Channel improvement, Monitoring, Flow, Inspection, On-site investigations, Evaluation, Economic feasibility.

Information and data are evaluated from the implementation of a mine drainage abatement demonstration project in two sections of a mined area near Morris Run Village, Tioga County, Pennsylvania. Effective mine drainage abatement techniques were demonstrated, a specific mine drainage problem was reduced, and portions of a strip mined area were restored almost to their original surface grades. The following techniques were demonstrated: the restoration of strip pits utilizing agricultural limestone and waste water sludge as soil conditioners; the burial of acid forming materials within restored strip mines; and the reconstruction and lining of a stream channel. Monitoring program data comparing associated flows and loadings before and after construction were used to determine the effectiveness of the project in reducing drainage discharge. The effectiveness of the design and construction methods was documented through on-site inspections, photography during project evaluation, and precipitation and flow measurements. The economic feasibility of these abatement measures was evaluated. The project resulted in an estimated acid reduction of 862 kilograms/day under average groundwater conditions from one of the sites. Results for the other site could not be confirmed due to gaps in the monitoring data. Reductions of 13 and 16% in acidity concentrations from the mine drainage discharges were documented. (Davison-IPA)

INTEGRATED SEWAGE TREATMENT SYSTEM,
R. H. Nealy.
U.S. Patent No. 4,135,665, 7 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 978, no 4, p 1270, January 23, 1979.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, Domestic wastes, Disinfection, Incineration, Equipment.

An on-site system for treating domestic sewage generated within a building is totally integrated with means for modifing space temperatures and for heating water for sanitary and other purposes to form a matrix of interrelated and interdependent functions acting together to deliver only non-polluting products to the environment and to achieve maximal energy conservation. The system extracts energy from sewage solids and organic wastes by incineration and thereby produces a net reduction in the aggregate fuel demand. The system also employs pressurized, liquid-phase thermal sterilization to treat the liquid sewage. (Sinha-OEIS)
W79-07397

COMPACT APPARATUS FOR THE PURIFICATION OF WASTE WATER BY A PHYSICAL CHEMICAL TREATMENT,
Degremont, Rueil-Malmaison (France). (Assignee).
R. Louboutin, and V. Savall.
U.S. Patent No. 4,136,012, 6 p, 1 fig, 8 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 4, p 1385, January 23, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Industrial wastes, Sewage treatment, Separation techniques, Neutralization, Coagulation, Flocculation, Sludge, Equipment, Flow-around objects.

A single, integrally formed tank has an upper portion of a rectangular configuration and a lower portion of downwardly decreasing volume defined by exterior walls, at least two of which are inclined downwardly and inwardly toward each other. The interior of the tank is divided into three serially connected compartments by means of interior walls which are inclined in directions substantially parallel to one of the inclined exterior walls. The compartment thus formed are a first, neutralization and coagulation compartment, a second, flocculation compartment, and a third, lamellar decanting and sludge settling compartment. Within the flocculation compartment are arranged spaced inclined plates defining upwardly inclined flow passages into which extend deflectors to create eddy currents in the water passing upwardly through the flocculation compartment. Within the decanting compartment are arranged inclined hollow tubes which facilitate downward settling of sludge and upward movement of the decanted water. (Sinha-OEIS)

METHODS AND APPARATUS FOR TREATING WASTEWATER,
Airco, Inc., Montvale, NJ. (Assignee).
B. S. Kirk, and R. M. Chappel.
U.S. Patent No. 4,136,023, 19 p, 9 fig, 13 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 4, p 1388-1389, January 23, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Sewage treatment, Oxygen, Activated sludge, Oxygenation, Equipment, Biological treatment.

This invention provides improved methods and apparatus for dissolving oxygen in wastewater treatment processes such as is required to satisfy the biological oxygen demand in the activated sludge process for the biodegradation of organic impurities. The invention enables attainment of high concentrations of dissolved oxygen with minimum consumption of oxygen and power. Wastewater with the high concentration of dissolved oxygen may be mixed with a larger volume of untreated wastewater to achieve the desired oxygen concentration and maintain volatile solids in suspension in the bulk liquid for optimum efficiency of purification. Oxygenation takes place within the unit by causing the stream of water entering the unit to pass into a pocket of oxygen rich gas maintained within the unit and impinge on

the surface of the water adjacent the trapped pocket of gas in a confined turbulent zone. Parameters are established to assure adequate residence time for the stream in the turbulent zone, after which the stream enters a more quiescent zone which allows undissolved oxygen to escape from the water and return to the gas pocket for reuse. The water containing a high level of dissolved oxygen is then directionally discharged at a predetermined velocity to mix thoroughly with the main body of wastewater. (Sinha-OEIS)
W79-07403

APPARATUS FOR AUTOMATICALLY SENSING AND RECORDING DATA IN A SEWAGE SYSTEM,
Tetradyne Corp., Carrollton, TX. (Assignee).
F. N. Mueller, and R. W. Chandler.
U.S. Patent No. 4,136,561, 15 p, 9 fig, 6 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 5, p 1575, January 30, 1979.

Descriptors: *Patents, *Control systems, *Automatic control, Monitoring, Data collection, Data storage and retrieval, Flow rates, Rainfall, Sewage monitoring system, Water depth.

A control module having circuitry for generating control and timing signals and for receiving digital data is described. Sensor modules are connected to the control module and each contains devices for sensing various physical characteristics such as flow rate, water level, rainfall or the like. In response to control signals generated by the control module, each of the sensor modules is operable to input digital data representative of the sensed physical characteristics to the control module. A recorder is connected to the control module and includes a removable recording cassette for recording the digital data transmitted from the sensor modules. The recorder also records the identification of the sensor module transmitting data, along with the calendar day and the time of day that the data was transmitted. This system solves the existing needs for an automatic monitoring system for sewage environment. (Sinha-OEIS)
W79-07408

PROCESS FOR TERTIARY TREATMENT OF WASTE WATERS FROM ANAEROBIC DIGESTION TREATMENT PROCESS,
Hitachi, Ltd., Tokyo (Japan). (Assignee).
M. Ishida, R. Haga, and Y. Odawara.
U.S. Patent No. 4,137,158, 9 p, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 5, p 1767-1768, January 30, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Tertiary treatment, Anaerobic digestion, Equipment, Ammonia, Nitrogen, Phosphate, Activated sludge, By-products, Fertilizers, Biochemical wastes.

A process for the tertiary treatment of biochemical waste waters comprises the following main steps: (1) adding milk of lime to waste water from the anaerobic digestion treatment process to render the waste water alkaline and recovering NH3 by reduced pressure distilation; (2) contacting recovered NH3 with a weakly acidic ion exchange resin to make NH3 adsorbed in the ion exchanger resin; (3) adding acid to the adsorbed ammonia to form an ammonia salt; and (4) blowing CO2 into the treated water from which NH3 has been removed, to recover P, and subjecting the treated water from which N and P have been removed to the activated sludge treatment to remove BOD. Since the digestion gas generated as a by-product can be used as the energy source of the treatment apparatus, the treatment cost is low, and the digestion sludge discharged as a by-product can be used as a high quality organic fertilizer. (Sinha-OEIS)

METHOD FOR TREATING WASTE WATERS,
Nippon Oil Co., Ltd., Tokyo (Japan). (Assignee).
M. Mohri, H. Takeda, M. Tsunemi, T. Uchiumi, and T. Kanda.
U.S. Patent No. 4,137,162, 6 p, 1 fig, 4 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 5, p 1769, January 30, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Oily water, Activated carbon, Oxygen, Chemical oxygen demand, Fluidized bed, Bilge water.

A method for treating waste waters to remove oils and/or COD comprises accomodating solid porous packing pieces and activated carbon particles in a container, the porous packing pieces forming a stationary porous packed bed, the average pore diameter being 1.5 to 8 times the average diameter of the activated carbon particles. The waste water is introduced together with an oxygen-containing gas and/or an oxidizing gas, from the bottom portion of the container to fluidize the activated carbon particles within the pores of the porous packing pieces and in spaces among the adjoining packing pieces and simultaneously to contact the waste water with the activated carbon particles. The upper level of the fluidized bed of the activated carbon particles is maintained at least 5 cm below the upper level of the porous packed bed. The treated water is withdrawn from the top portion of the container. (Sinha-OEIS)
W79-07412

TREATMENT OF VEGETABLE TANNING WASTES,
Eberle Tanning Co., Westfield, PA. (Assignee).
H. H. Young.
U.S. Patent No. 4,137,163, 7 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 5, p 1769, January 30, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Tannery wastes, Separation techniques, Color, Suspended solids, Flocculation, Polymers, Alakaline water, Combustion gases, Scrubbing.

Highly colored tannin bodies and other suspended solids are separated from highly alkaline vegetable tannery waste effluent by scrubbing hot combustion gas with the effluent, introducing polyacrylamide flocculant into the effluent either immediately before scrubbing or during scrubbing, and separating floatable foam and settleable solids from the effluent after scrubbing. The effluent may be treated with a soluble salt of a trivalent metal before scrubbing to act as a primary flocculant. (Sinha-OEIS)
W79-07413

PROCESS FOR CLARIFYING IRON ORE SLIMES,
American Cyanamid Co., Stamford, CT. (Assignee)
A. T. Coscia, and M. N. D. O'Connor.
U.S. Patent No. 4,137,164, 7 p, 4 tab, 9 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 5, p 1770, January 30, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Mine wastes, Separation techniques, Suspended solids, Iron, Flocculation, Polymers, Adsorption, Iron ore slimes.

The process employs a polyacrylamide chemically modified to contain certain quaternized dimethylaminomethyl groups and of low molecular weight. The ore slimes which are effectively clarified by these polymers are those which contain up to about 100,000 parts per million of suspended inorganic solids. The process is particularly effective in the clarification of iron ore slimes. After the chemically-modified polymer has been mixed with the slime, small absorbent flocs involving part of the suspended solids will immediately form. These flocs, because of their nature, can be kept in suspension by application of suitable agitation, usually slow speed, and while in suspension will adsorb additional suspended solids. After the suspendible flocs have adsorbed a suitable amount of the remaining solids in suspension, the resulting flocs are allowed to settle. The clarified water may be decanted or otherwise recovered in accordance with conventional procedures. (Sinha-OEIS)
W79-07414

PROCESS FOR THE PURIFICATION OF WASTE WATER CONTAINING AMMONIA AND AMMONIA SALTS,
Deutsche Gold- and Silver-Scheideanstalt A. G., Frankfurt-am-Main (Germany, F.R.) (Assignee).
W. Heimberger, and H. Schmitt.
U.S. Patent No. 4,137,166, 5 p, 1 tab, 3 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 5, p 1770, January 30, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial wastes, Ammonia, Ammonium salts, Hydrogen ion concentration, Neutralization, Nitrogen, Alkali metals, Alkaline earth metal hypochlorites.

Waste water which contains ammonia or ammonium salts can be purified with alkali metal or alkaline earth metal hypochlorites quantitatively in a very short time and without formation of the explosive nitrogen trichloride if the waste water is adjusted to an initial pH of 8-10.5 with an alkaline material and then treated with an amount of alkali metal or alkaline earth metal hypochlorite in an amount practically equivalent to the ammonia or ammonium ion content. By adjustment of the pH before addition of the hypochlorite solution to at least 8 and maintaining a pH of about 6-8 during the entire reaction, i.e., up to the end of the development of nitrogen, the development of nitrogen trichloride which has always been observed in the past is completely suppressed. (Sinha-OEIS)
W79-07416

PROCESS FOR TREATING WASTE WATER AND AN APPARATUS THEREFOR,
Ishigaki Kiko Co., Ltd., Tokyo (Japan). (Assignee).
I. Yokata.
U.S. Patent No. 4,137,171, 18 p, 21 fig, 1 tab, 12 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 5, p 1772, January 30, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Sewage treatment, Biologic treatment, Microorganisms, Microbial degradation, Aerobic conditions, Equipment, Mesh net units.

Waste water to be purified is brought successively into contact with a number of net units which are arranged in a treating tank with certain intervals between them. Organic substances in the waste water are removed due to decomposition, which adhere to the net units. Contact area between the organic substances and the microorganisms is large, and various kinds of microorganisms propagate. Water is recirculated by the aid of air jetting from nozzles. Simultaneously dissolved oxygen in the waste water is enriched by the air supplied by the air-jetting nozzles. Thus, removal of the organic substances proceeds effectively and promptly. An apparatus which is suitable for carrying out the process is also proposed. (Sinha-OEIS)
W79-07417

CHARGED MEMBRANE, LOW PRESSURE ULTRAFILTRATION TO TREAT ACID MINE DRAINAGE WATERS,
Kentucky Water Resources Research Center, Lexington.
D. Bhattacharyya, R. B. Grieves, and S. Shelton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 209, Price codes: A09 in paper copy, A01 in microfiche. Research Report No. 120, 1979. 178 p, 51 fig, 31 tab, 56 ref. OWRT B-050-KY (1), 14-34-0001-7160.

Descriptors: *Acid mine water, *Membrane processes, Chemical precipitation, Water reuse, Reverse osmosis.

Low-pressure ultrafiltration with negatively-charged, non-cellulosic membranes is shown to be a feasible process in terms of achieving the simultaneous separation of dissolved metals (and sulfate) and of suspended solids from acid mine drainage

water. The process is evaluated in terms of the simultaneous achievement of good water flux without membrane fouling and of adequate ultrafiltrate quality at high water recovery for water reuse operation. At a transmembrane pressure of 5.6 x 105 N/m2, water fluxes in the range of 5.8 x 10-4 cm/sec to 12.5 x 10-4 cm/sec could be obtained at 97% water recovery. The results of the ultrafiltration investigations are compared with the reported results from lime precipitation-settling and reverse osmosis treatment field studies in terms of treated water quality, reusability, concentrated (sludge) production rates, water recovery and membrane flux behavior. With a lime precipitation-settling process the treated water would be saturated with calcium sulfate.

STORM WATER CHARACTERISTICS OF SOME ROTTERDAM SEWERAGE DISTRICTS,
Dienst Gemeentewerken, Rotterdam (Netherlands).
G. van der Kroon.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 292-302, 1977. 5 fig, 3 tab, 5 ref.

Descriptors: *Storm water characteristics, *Sewerage districts, *Rotterdam(The Netherlands), *Waste water treatment, *Water quality, Pumping, Comprehensive planning, Rivers, Treatment facilities, Surface waters, Runoff, Design criteria, Overflow, Mathematical models, Cost saving.

The cost of connecting the old quarters of Rotterdam to a wastewater treatment plant was estimated to be one hundred million guilders in 1971, including the costs of new high pressure mains to connect the existing pumping stations to the water treatment plant, upgrading these stations (13 to them), reconstructing sewers, and so forth. This explains why urban drainage systems deserve more interest and study. To be successful, such a study must be done on a full technical scale. It is expected that this study will result in the collection of many important data which may reduce the cost; rational solutions to the comprehensive plan will be yielded with respect to sewage treatment. The pumping system of Rotterdam needs the concept of storm water overflow pumps to the river to maintain a low storm water overflow frequency to the surface water inland of the embankment of the river and to maintain a reasonable storm water pumping rate to the wastewater treatment plant. The storm water overflow pumping system has the following advantages: (1) a reduction of pollution of the inland surface water (i.e., canals) in the center of the city; (2) a reduction of the total quantity of rinsewater needed for maintaining the quality of the water in the canals; (3) a reduction of the storm water pumping rate to the wastewater treatment plant. CLOSED WATER-USE CYCLES IN URBAN INDUSTRIAL COMMUNITIES,
Akademiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
V. S. Kaminskii.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of Amsterdam Symposium, October, 1977. IAHS-AISH Publ. No. 123, Intern. Assoc. of Hydrological Sciences, p 448-454, 1977.

Descriptors: *Water quality control, *Recycling, *Industries, *Waste water(Pollution), *Treatment facilities, *Closed water-use cycles, Urban development, Freshwater, Water supply, Economic efficiency, Effluents, Standards, Industrial communities, Wasteless technology, USSR.

The growth of industrial communities causes difficulties in their freshwater supply. Under such conditions, the main task is the creation of closed water-use cycles in industrial plant (introduction of technology without waste water), these cycles being the first stage of the creation of wasteless processes. It is necessary in the future to include additionally treated municipal waste water in industrial and communal water recycling systems. The development of industrial and municipal closed water-use systems in urban communities is quite possible from the technological and sanitary-hygienic points of view, and it is socially and economically advisable. (See also W79-07426) (Bell Graf-Cornell)
W79-07475

THE MEANS AND PROBLEMS OF PREVENTING POLLUTION OF SURFACE WATERS BY WASTE WATERS FROM CITIES,
Akademiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
O. T. Bolotina.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 471-477, 1977. 2 fig, 1 tab, 8 ref.

Descriptors: *Surface waters, *Water pollution control, *Municipal wastes, *Waste water treatment, Standards, Water conservation, Industrial wastes, Evaluation, Water bodies, Waste water(Pollution), Domestic wastes.

A most urgent task for water conservation is to stop the pollution of water bodies by waste water discharged by sewers from large industrial cities. Presently, industrial wastes are prevalent in urban waste water, but a substantial decrease in the quantity of these is expected. Also, the volume of domestic waste water is expected to increase because houses will be more modern. By analyzing the present situation and evaluating future trends, the joint treatment of domestic and industrial waste waters is recommended. The processes responsible for the quality of water bodies depend on various factors, with the decisive one being the discharge of urban waste water. It is essential for pollution control to start at the sources of the pollutants and that the observance of standards established for all stages of the collection and treatment of waste waters be strictly supervised. For future techniques, the classical complete biological treatment of urban waste waters will be adequate to preserve the quality of water in lakes and reservoirs. Supplementary treatment by filtration through sand is perhaps necessary in some cases. The extraction of biological substances will be necessary for large flows of waste water with high concentrations of pollutants. A strict observation of established standards for the composition of industrial effluents which discharge into the sewerage network is imperative. For self-purification of water bodies, the waste waters discharged into them must first undergo biological treatment. (See also W79-07426) (Bell Graf-Cornell)

EVALUATION OF LAND APPLICATION SYSTEMS,
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 440, Price codes: A09 in paper copy, A01 in microfiche. Report EPA-430/9-75-001, 1975. 194 p, 4 fig, 15 tab, 185 ref, 7 append.

Descriptors: *Application methods, *Land use, *Ultimate disposal, *Return flow, *Operation and maintenance, Treatment facilities, Design criteria, Sites, Waste water treatment, Waste water disposal, Municipal wastes.

Procedures are outlined for EPA personnel for the application of municipal waste water to land. An evaluation checklist and relative background information are provided. Sections are included on facilities plans, design plans and specifications, and operation and maintenance manuals. The first section provides a thorough evaluation of land application alternatives and the preparation of a detailed facilities plan as well as evaluations of potential sites, land application alternatives, design considerations, and environmental factors. The second section describes procedures for evaluating design plans and specifications with emphasis on the agreement of the facilities design with the conditions of the particular site. The third section outlines special considerations for land application systems with respect to operating procedures, monitoring requirements, and impact control. (Lisk-FRC)

COST AND EFFECTIVENESS COMPARISONS OF VARIOUS TYPES OF SLUDGE IRRADIATION AND SLUDGE PASTEURIZATION TREATMENTS,
Sandia Labs., Albuquerque, NM.
M. E. Morris.
Available from the National Technical Information Service, Springfield, VA 22161 as SAND-76-5780, Price codes: A03 in paper copy, A01 in microfiche. Report, 1976. 18 p, 2 fig, 6 tab, 3 ref.

Descriptors: *Sewage sludge, *Disinfection, *Irradiation, *Heat treatment, *Thermal radiation, Capital costs, Cost analysis, Comparative costs, Pathogenic bacteria, Viruses, Salmonella, Sewage bacteria, Municipal wastes.

Gamma irradiation and thermoradiation were compared with heat pasteurization for the disinfection of both liquid and dry sludges. Heat pasteurization of sludge is conducted at 70C for 30 min. The irradiation process utilizing cesium-137 treats the sewage sludge with 1 megarad with simultaneous oxygenation of the sludge. Thermoradiation to disinfect the sludge is conducted at 55C with 300 kilorads for 5 min. Irradiation effectively inactivated pathogens in the sludge except viruses. Ther-

moradiation utilized temperatures high enough to kill the virus population. In dry sludge with a moisture content of 30-50%, heat and irradiation inactivation of salmonella occurred at rates comparable to treatment of liquid sludges. For a 4.2 ton/day sludge disinfection plant, capital costs were estimated at: $98,600 for pasteurization, $536,000 for irradiation, and $571,000 for thermoradiation. For a 20.8 ton/day plant, capital costs were: $236,200 for pasteurization, $678,000 for irradiation, and $856,000 for thermoradiation. However, irradiation and thermoradiation are more energy conserving than pasteurization, and irradiation may be less expensive than the other two disinfection processes; heat treatment and thermoradiation costs are comparable for the larger plant sizes. The irradiation of dry composted sludge was considered more practical and less costly than any of the liquid sludge treatment methods. (Lisk-FRC)

AN APPRAISAL OF UNDERGROUND RADIOACTIVE WASTE DISPOSAL IN ARGILLACEOUS AND CRYSTALLINE ROCKS: SOME GEOCHEMICAL, GEOMECHANICAL AND HYDROGEOLOGICAL QUESTIONS,
California Univ., Berkeley. Lawrence Berkeley Lab.
J. A. Apps, G. W. Cook, and P. A. Witherspoon.
Geotechnical Assessment and Instrumentation Needs Symposium, July 16-19/19-30, 1978, Berkeley, California, Lawrence Berkeley Laboratory, Earth Science Division, University of California, Berkeley. 1978. 50 p, 10 fig, 9 tab, 29 ref.

Descriptors: *Radioactive waste disposals, *Underground waste disposals, Engineering geology, Hydrogeology, Geochemistry, Storage, Stress, Hydraulic conductivity, Hydraulic gradient, Groundwater movement, Leaching, Waste dilution, Adsorption, Crystalline rocks, Shales.

Radioactive wastes are being stored in increasing quantities at surface and near surface sites. Deep burial of these wastes is the most favorable alternative method of disposal. This paper appraises the potential for underground storage of radioactive wastes and defines the more significant factors affecting the selection and design of a repository. Those areas of geomechanics, hydrogeology, and geochemistry where further research is needed are identified. The geomechanical stability of a suitable repository site depends in general on the absence of major geological perturbations, and specifically, on a state of stress conducive to stability. The most likely means by which radioactive materials could be released to the biosphere is through transport by ground water in joints and fractures. This release is retarded by low hydraulic conductivity, small hydraulic gradients, long flow paths, leaching of the waste by groundwater, dilution, and sorption in the rock mass. Argillaceous and crystalline rocks may provide suitable sites for nuclear wastes repositories. (Purdin-NWWA)

ANALYSIS OF SAND SAMPLES FROM THE SAND ISLAND SEWER OUTFALL, MAMALA BAY, O'AHU (INTERIM PROGRESS REPORT),
University of Hawaii at Honolulu, Hawaii. Water Resources Research Center.
S. A. Reed.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 145, Price codes: A02 in paper copy, A01 in microfiche. Technical Memorandum Report No. 60, May 1978. 19 p, 2 fig, 2 tab, 3 ref, append.

Descriptors: *Invertebrates, *Benthic fauna, Annelids, Marine algae, Chlorophyta, Coral, Mollusks, Hawaii, Sampling, Sewage outfall, Sand, Foraminifera, Pinna semicostata, Chaetopterus, Mamala Bay, Oahu.

Sand grab samples were collected from nine locations at and around existing and proposed ocean sewage outfalls and at a control station. The preserved samples were analyzed for abundance of invertebrates. Stations in the vicinity of the existing outfall (12 m deep) were characterized by high abundance of annelid tube worms which grew in huge, densely packed clusters. Foraminfera and the green algae Halimeda sp. were absent or in relatively low abundance. In the vicinity of the proposed outfall (65 m deep), samples contained high abundance of Halimeda sp., moderate quantities of Foraminifera, and the solitary coral Fungia fragilis; no annelid worms were found. This pattern of abundance was similar to the control station. The pen shell Pinna semicostata was present at most deep water stations. Extensive beds of this mollusk are common in other regions along south O'ahu.

5F. Water Treatment and Quality Alteration

MAGNETIC WATER CONDITIONERS: ARE THEY FOR REAL,
National Water Well Association, Worthington, OH.
T. E. Gass.
Water Well Journal, Vol. 33, No. 6, p 32-33, June, 1979.

Descriptors: *Water treatment, *Scaling, *Magnets, Water softening, Aesthetics, Corrosion, Descaling, Rusting, Laboratory tests, Taste, Odor, Water structure.

Magnetic or electrostatic water conditioners claim to eliminate encrustation and corrosion problems due to various causes, solve taste and odor problems caused by hydrogen sulfide and increase dissolved oxygen content of water. The mechanics of these systems involves the use of magnets to modify the molecular structure of water so that scale and/or rust is prevented from adhering to pipes. However, after extensive testing by the author, no evidence was found to support the manufacturer's performance claims. Other researchers have noted that magnetic treatment of water produces a less adhesive, more friable scale during laboratory tests. However, similar tests performed by the U.S. Naval Engineering Experiment Station failed to reveal any reduction in scale formation. (Purdin-NWWA)
W79-07194

IODINE FOR DISINFECTION,
B. Whitehead.
Canadian Water Well, Vol. 5, No. 2, p 9-10, May, 1979. 3 fig, 3 ref.

Descriptors: *Disinfection, *Iodine, *Water purification, Water treatment, Domestic water, Water supply, Chlorination.

Iodine has been used to sterilize water since the early 1900's. Until recently, its use has been restricted to emergency or periodic use. Prolonged use of iodine was shown to have no adverse effects and presently it is being used increasingly for treatment of individual water supplies. Iodine treatment systems can use iodine crystals on a complexed iodine liquid. The concentration of iodine and the contact time required for disinfection is temperature dependent. Under fluctuating consumption conditions, the temperature in the contact tank will vary. Therefore, tank volume and the minimum concentration of iodine must be based on the minimum water temperature. Iodine up to 1.5 mg/l imparts no observable taste or odor. Iodine is relatively inert with respect to ammonia and other organics such that iodamines are not formed as chloramines (potential carcinogens) are formed by chlorination. High organic contents in water creating high iodine demands may, however, preclude the use of iodine for disinfection. Carbon filtration removes iodine and therefore any potential negative effects of iodination. There is, however, no residual to maintain the bacterial integrity of the system. Long term physiological effects of iodination are as yet uncertain, particularly in children, and more research is needed. (Purdin-NWWA)
W79-07199

EVALUATION OF PHYSICAL-CHEMICAL TECHNOLOGIES FOR WATER REUSE, BY-PRODUCT RECOVERY AND WASTEWATER TREATMENT IN THE FOOD PROCESSING INDUSTRY.
Dearborn Environmental Consulting Services, Mississauga (Ontario).
Water Pollution Control Directorate, Environmental Protection Service, Environment Canada, Ottawa, Canada, April, 1979, Economic and Technical Review Report EPS 3-WP-79-3, 172 p, 37 fig, 17 ref, 12 tab.

Descriptors: *Water reuse, *Waste water treatment, *Waste water management, *Food processing industry, Effluents, Quality control, Byproducts, Pollution abatement, Technology, Econometrics, Chemcontrol, Physical control.

Physical-chemical treatment systems can be incorporated into the process line of an industry or may be used to enhance an existing treatment system. The more consistent effluent quality from physical-chemical treatment systems makes them amenable to byproduct recovery or water reuse schemes. While many such systems are more expensive than conventional treatment, the prospect of valuable byproduct recovery makes them more attractive. The objective of this manual is to provide a comprehensive review of physical-chemical and advanced treatment technologies and their application to the food industry. Such documentation should provide food industry personnel with valuable information on treatment alternatives available to meet their specific needs. A general section covering the economic considerations is included to augment the design criteria. Case histories from the majority of the food industry have been included to add operational information. (WATDOC)

METHOD FOR TREATING WATER,
Osaka Gas Co. Ltd., (Japan). (Assignee).
Y. Sakamoto, M. Kinugasa, S. Endo, M. Yamane, and S. Fujie.
U.S. Patent No. 4,136,027, 9 p, 2 fig, 14 tab, 4 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 4, p 1389-1390, January 23, 1979.

Descriptors: *Patents, *Water treatment, *Water purification, Water quality control, Adsorption, Ozone, Oxidation, Gases, Silica gel.

When an ozone-containing gas prepared by an ozone generator from a gas having a higher oxygen content than air is supplied at atmospheric or elevated pressure to an adsorption tower packed wil silica gel, ozone is selectively adsorbed by the silica gel in preference to the other gas components and is thereafter desorbable by a carrier gas fed to the adsorption tower at a pressure lower than the pressure applied for the adsorption to give a gas having a higher ozone concentration than the above-mentioned ozone-containing gas. When the ozone-containing carrier gas is brought into contact with the water to be treated, the water absorbs an increased amount of ozone and can be treated with greatly improved efficiency. The gas from which the ozone is removed is recycled to the ozone generator and is reused as a portion of the starting material. Further research shows that employing three to four adsorption towers, such that in order to purge one tower of the carrier gas after the desorption step which tower is at a reduced pressure, a portion of oxygen-containing gas in another tower of a higher pressure is used, whereby the oxygen consumption can be materially reduced. Based on these findings this invention accomplished a method of treating water on an industrial scale. (Sinha-OEIS)

PROCESS FOR CLARIFYING RAW WATER,
American Cyanamid Co., Stamford, CT. (Assignee).
A. T. Coscia, and M. N. D. O'Connor.
U.S. Patent No. 4,137,165, 6 p, 9 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 5, p 1770, January 30, 1979.

Descriptors: *Patents, *Water treatment, *Water purification, Suspended solids, Polymers, Flocculation, Turbidity, Adsorption, Raw water.

Use of a low molecular weight polyacrylamide modified to provide quaternized dimethylaminomethyl groups in the clarification of raw water produces improved clarification. After the chemically-modified polymer has been mixed with the raw water, small absorbent flocs involving part of the suspended solids will immediately form. These flocs, because of their nature can be kept in suspension by application of suitable agitation and will adsorb additional suspended solids. After the suspendible flocs have adsorbed a suitable amount of the remaining solids in suspension, the resulting flocs are allowed to settle, thus providing supernatant clarified water and a sediment of flocculated inorganic solids. The clarified water may be decanted or otherwise recovered. (Sinha-OEIS)

5G. Water Quality Control

RESEARCH INITIATION--OPTIMAL CONTROL OF ARTIFICIAL AERATION IN POLLUTED RIVERS,
Columbia Univ., New York.
R. W. Longman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 346, Price codes: A07 in paper copy, A01 in microfiche. Report, 1976. 126 p, 2 fig, 85 ref, 1 append.

Descriptors: *Aeration, *Rivers, *Water pollution treatment, *Abatement, *Water quality, Costs, Statistical models, Stochastic processes, Oxygen.

The direct introduction of oxygen into polluted rivers by artificial aeration was investigated. Optimal control of the aeration system in order to get the greatest improvement in water quality for the cost or energy expended, was emphasized. The optimal aeration policy was determined for a general river with multiple waste effluent sources, variable river cross section, and variable stream velocity. A stochastic river model was used to account for uncertainties and noise in the system. Various feedback structures were considered, and their performance was compared. An aeration controller was obtained which took into consideration the cost of making water quality measurements. (Small-FRC)

INHIBITION OF NITRIFICATION IN SOILS,
Iowa State Univ., Ames. Dept. of Agronomy.
L. G. Bundy, and J. M. Bremner.
Soil Science of America Proceedings, Vol. 37, No. 3, p 369-398, May-June 1973. 4 tab, 9 ref. OWRT A-041-IA(5).

Descriptors: *Nitrification, *Inhibitors, *Ammonium compounds, *Ureas, Nitrates, Nitrites, Chemical reactions, Soil types, Soil amendments, Clays, Clay loam, Water pollution sources, Water pollution abatement, Fertilizers, Agricultural chemicals, Groundwater, Water pollution.

The effectiveness of 24 compounds proposed as inhibitors of nitrification in soils was compared and the effects of temperature and form of nitrifiable N on inhibition of nitrification by these compounds was examined. Soils were treated with ammonium sulfate and incubated for 14 days at 30C to determine the effects of 10 ppm of each compound on the amounts nitrate and nitrite produced. With the three soils used the average effectiveness of the most potent inhibitors decreased. The results obtained with 14 inhibitors, two soil additives, and variations in incubation time and temperatures are tabulated. The results indicate that the effectiveness of the inhibitors was significantly affected by soil type, soil temperature and substitution of urea for ammonium sulfate as the source of nitrifiable N. Most inhibitors were more effective at 15C than at 30C. The results obtained with the 10 compounds studied, but not tabulated, show that none had a significant effect on nitrification under the conditions studied. (Davison-IPA)

EFFECTS OF SOIL PH AND MOISTURE ON THE DIRECT RADIOASSAY OF HERBICIDES IN SOIL,
Nebraska Univ., Lincoln. Dept. of Agronomy.
T. L. Lavy.
Weed Science, Vol. 23, Issue 1, p 49-52, January 1975. 4 tab, 12 ref. OWRT A-024-NEB(3).

Descriptors: *Herbicides, *Analytical techniques, *Assay, *Separation techniques, *Acidity, *Soil properties, Water pollution sources, Degradation(Decomposition), Chemical degradation, Clay loam, Water pollution, Groundwater.

The factors involved in the direct radioassay technique governing the extraction of 14C herbicides from soil were studied. A silty clay loam soil was ground to pass a 841 micron sieve and treated with the addition of 2,000 to 15,000 dpm of a 14C labeled herbicide in a methanol solution. Herbicide concentrations on soils ranged from 0.01 ppm to 2.0 ppm. When the methanol evaporated from the C-herbicide-soil slurry, the samples were thoroughly mixed. An addition of 1.5 ml water or 1.5 ml of 0.1 N oxalic acid solution to 2g soil samples containing 14C labeled herbicides increased the 14C extraction efficiencies. A modified dioxane extracting-counting solution was used which allowed the addition of 2 ml water without causing a liquid phase separation. Benzoic herbicide extraction from the soil was increased by the addition of 5 mg oxalic acid to 2g soil or when the soil was acidified to pH 4.1. (Davison-IPA)

FORMS OF METALS IN WATER,
Department of Fisheries and Environment, Ottawa (Ontario). Inland Waters Directorate.
A. Demayo, A. R. Davis, and M. A. Forbes.
Scientific Series No. 87, 1978, 24 p, 1 fig, 94 ref.

Descriptors: *Metals, *Toxicity, *Biota, *Water quality, Water properties, Suspended solids.

This final report of a Water Quality Branch Headquarters Task Force reviews published scientific information on forms of metals in water and their toxicity to biota. It recommends the types of determinations that should be carried out by Water Quality Branch laboratories, the results of which are used in setting water quality objectives, in surveillance of compliance to water quality objectives, and in writing interpretive reports. For the purposes listed above, the Task Force suggests that the following be measured in all water samples: (1) dissolved (0.45 micro m) concentrations in water, (2) total concentrations in the suspended materials and the weight of the suspended materials per litre of water, and (3) total concentrations in the medium and fine fractions (less than 0.149 mm) of the bottom materials. INTERLABORATORY QUALITY CONTROL STUDY NO. 18 TOTAL MERCURY IN SEDIMENTS,
Department of Fisheries and Environment, Ottawa (Ontario). Inland Waters Directorate.
K. I. Aspila, and J. M. Carron.
Report Series No. 61, 1979, 19 p, 1 app, 3 fig, 3 ref, 6 tab.

Descriptors: *Lake sediments, *Mercury, *Laboratory tests, Analysis, Lake Superior, Lake Erie, Lake Ontario.

Results of an interlaboratory comparison study on the analysis of mercury in five lake bottom sediments are described. Twenty-eight Canadian laboratories participated. Concentrations of mercury in uncertified test samples ranged from 0.01 micro g per g to 0.6 micro g per g Hg. Mean values from participants were evaluated by rank correlation. Estimates of the concentration of mercury in each sample were determined by sequentially eliminating all data beyond two standard deviations of adjusted mean values. Precision functions identifying average in-laboratory and interlaboratory standard deviations as a function of mean calculated mercury content are described. These precision functions identify the anticipated comparability of mercury data when a variety of different laboratories analyzes the mercury content in processed dry sediments (less than 177 micro m) using different methods. (WATDOC)

HYDROCHEMICAL STUDY OF GROUNDWATER FLOW IN THE INTERSTREAM AREA BETWEEN THE OTTAWA AND ST. LAWRENCE RIVERS,
Department of the Environment, Ottawa (Ontario). Water Resources Branch.
J. E. Charron.
Scientific Series No. 76, 1978, in English and French, 28 p, 41 fig, 34 ref.

Descriptors: *Base flow, *Groundwater, *Hydrogeology, *Flow, *Bedrock, *Mapping, Geology, Climate, Infiltration, Data collections, Sampling, Water wells, Contours, Programs, Chemical analysis, Rivers, Streams, Elevation, *Hydrochemistry,

*Ottawa River, *St. Lawrence River, Contact zone.

The interstream area extending some 80 to 85 mi (130 to 140 km) upstream from the junction of the Ottawa and St. Lawrence rivers has been surveyed to determine the directions of groundwater flow. Hydrogeological and hydrochemical data have been compiled and are presented in the form of computer calculated contour maps at a scale of 1 to 250,000. An explanatory note accompanies each map describing the main features, trends, and discrepancies. Most of the maps are chemical maps and they form the basis on which a qualitative assessment of groundwater flow was made. The interpretations of both regional and local flows indicate that regionally very little groundwater flows towards the St. Lawrence River, proving that the bedrock configuration controls the direction of flow. LIMITATIONS OF SINGLE WATER SAMPLES IN REPRESENTING MEAN WATER QUALITY II SPATIAL AND TEMPORAL VARIATION IN NUTRIENT CONCENTRATIONS IN THE OKANAGAN RIVER AT OLIVER, B.C.,
Department of the Environment, Vancouver (British Columbia). Water Quality Branch.
P. H. Kleiber, P. H. Whitfield, and W. E. Erlebach.
Technical Bulletin No. 107, 1978. 30 p., 10 fig., 7 tab, 9 ref, 2 append.

Descriptors: *Water sampling, *Water quality, *Spatial distribution, *Temporal distribution, Variability, Nutrients, Phosphates, Nitrites, Organic compounds, Carbon, *Okanagan River, *British Columbia.

The Water Quality Branch, Pacific and Yukon Region, is investigating the spatial and temporal variation in water quality at selected monitoring stations in the region. This report concerns such as investigation at four stations located on the Okanagan River near Oliver, British Columbia. The objectives of the study are: (1) to determine representative values of water quality for the reach of river at which each station is located; (2) to ascribe confidence limits for the present values; (3) to estimate the confidence limits that can be applied to single grab samples collected at the station in the past; and (4) to determine the sampling effort necessary to detect year-to-year trends in water quality. PROCEEDINGS SLUDGE UTILIZATION AND DISPOSAL SEMINAR TORONTO, ONTARIO, FEBRUARY 20 AND 21, 1978,
Environmental Protection Service, Ottawa (Ontario). Water Training and Technology Transfer Div.; and Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
Canada-Ontario Agreement on Great Lakes Water Quality, Conference Proceedings No. 6, 428 p. 1978.

Descriptors: *Sludge disposal, *Waste water disposal, *Sludge treatment, Sampling, Viruses, Animal parasites, Metals, Lysimeters, Agricultural watersheds, Dewatering, Energy, Incineration, Aeration, Regulation, Costs, Analysis, *Waterloo, *Windsor, *Ontario, *Sludge thickening, Composting.

The Government of Canada and the Government of the Province of Ontario signed an agreement on August 13, 1971, to ensure that the water quality of the Great Lakes is restored and protected. One of the principal provisions of the Canada-Ontario Agreement was to provide for the acceleration of the construction of municipal sewage treatment projects for the abatement of pollution and to introduce phosphorus removal at all significant municipal sources. An additional important financial provision of the Agreement was for a research program directed towards reducing the cost of waste treatment and ensuring that the latest technological advances were incorporated to achieve the specific water quality objectives set out in the Agreement. A significant concern which was identified was the handling and disposal of sludges produced from the chemical treatment of sewage for phosphorus removal. Under the direction of the Sub-committee for the Land Disposal of Sludges, research projects have been conducted, both in-house and through external contracts, on sludge handling and disposal methods. Fifteen papers were presented, covering all facets of sludge handling from sampling methods and metal sources, through sludge conditioning and dewatering to incineration, composting and the regulatory aspects of sludge disposal. Sludge handling and disposal is the most difficult and most costly single aspect of wastewater treatment today. Up to 60 percent of the total cost of operating and maintaining municipal wastewater treatment plants is associated with sludge management. Cost-effective sludge disposal requires the examination of all process options. (WATDOC)

Descriptors: *Fish, *Carp, *Spawning, *Fish reproduction, *Fish eggs, *Fertility, Sexual maturity, Fish establishment, Aquatic environment, Fish diets, Fish food organisms, Eutrophication, Impounded waters, Rivers, Transvaal.

Because of serious eutrophication in several South African rivers and impoundments two Chinese phytophagous carp species, Ctenopharyngodon idella (Val.) and the silver carp, Hypothalmichthys molitrix (Val.) were imported. These species, known for their ability to utilize water weeds and phytoplankton as food, do not normally spawn outside their native range in the Amure River basin of mainland China and Russia. The fish are artificially spawned through the use of a combination of human chorionic gonadotrophin (HCG) and pituitary gland extract (PGE). Successful spawning of both species was produced by an initial injection of low dosage of HCG followed 24 hours later by a set of two main dosages, about seven hours apart; the first dose was HCG and the second, PGE. Within 24 hours of fertilization larvae of both species hatched. This induced spawning provided sufficient offspring for several research projects on evaluating the grass carp as a biological means to control certain noxious aquatic weeds in Transvaal impoundments. COMPREHENSIVE WATER QUALITY MANAGEMENT FOR THE STATE OF SOUTH DAKOTA: 303(E) BASIN PLAN FOR THE RED RIVER OF THE NORTH RIVER BASIN,
South Dakota Dept. of Environmental Protection, Pierre.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 085, Price codes: A07 in paper copy, A01 in microfiche. 1976, 125 p, 6 append, 11 tab, 2 fig.

Descriptors: *Water quality management(Applied), *River basins, *Regional planning, *Water quality, *Water quality standards, *Red River of the North River Basin(SD), *South Dakota, Water pollution control, Water pollution sources, Water quality control, Hydrology, Suspended solids, Dissolved oxygen, Typography, Soils, Effluents.

This report presents South Dakota's strategy for correcting water pollution and thereby improving and maintaining water quality in the South Dakota portion of the Red River of the North River Basin. The South Dakota portion of the Basin consists of the area drained by Lake Traverse and the Bois de Sioux River. This area drains 600 square miles, is a broad, level plain varying in width from 15 to 70 miles and slopes towards the north. It is expected that the Basin will continue to lose population

primarily due to migration from the farm to city. The economy is entirely dependent on agriculture. This plan specifies the process of planning and managing pollution abatement operations to achieve South Dakota's standards for pollution discharges to, and water quality in, Red River of the North River Basin's lakes, rivers and tributaries. General information pertaining to 303(e) plans, statutory authority for planning, an analysis of P.L. 92-500 (especially Section 303), and constitutional constraints to basin planning are offered. An in-depth basin profile is presented, including topography, hydrology, soils, surface water quality standards and classification of stream segments. Sources and effects of both point and non-point pollution are described through inventories of municipal, industrial and agricultural discharges with accompanying charts showing which streams are adversely affected by which type of pollution source. The appendices present water quality parameters, surface water quality standards, a summary of permit rationale, and a summary of public comments. (Coan-NC)
W79-07380

COMPREHENSIVE WATER QUALITY MANAGEMENT FOR THE STATE OF SOUTH DAKOTA. 303(E) BASIN PLAN FOR THE CHEYENNE RIVER BASIN 08SD0700,
South Dakota Dept. of Environmental Protection, Pierre.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 068, Price codes: A07 in paper copy, A01 in microfiche. 1974. 129 p, 5 append, 21 tab, 3 fig.

Descriptors: *Water quality management(Applied), *River basins, *Regional planning, *Water quality, *Water quality standards, *Cheyenne River Basin(SD), *South Dakota, Water pollution control, Water pollution sources, Best practicable treatment, Water quality control, Hydrology, Suspended solids, Dissolved oxygen, Typography, Soils, Effluents, Non-point source pollution.

This report presents South Dakota's strategy for correcting water pollution and thereby improving and maintaining water quality in the Cheyenne River Basin. This basin is roughly wedgeline in shape, and includes the northeastern corner of Wyoming, the southeastern corner of Montana, the southwestern corner of South Dakota, the northwestern corner of Nebraska, and the area through central South Dakota to the Missouri River. The sub-basin varies from 40 to 80 miles in width, drains an area of 12,955 square miles in South Dakota, and generally has excellent water quality, but there is evidence that water quality is declining. This plan specifies the process of planning and managing pollution abatement operations to achieve South Dakota's standards for pollution discharges to, and water quality in, Cheyenne River basin's lakes, rivers, and tributaries. General information pertaining to 303(e) plans, the statutory authority for planning, an analysis of Federal law P.L. 92-500 (especially Section 303), and constitutional constraints to basin planning are presented. An in-depth basin profile is presented, including topography, hydrology, soils, surface water quality standards, and classification of stream segments. Sources and effects of both point and non-point pollution are described through inventories of municipal, industrial and agricultural discharges with accompanying charts showing which streams are adversely affected by which type of pollution source. The appendices include a list of water quality surveys, surface water quality standards, a list of water quality monitoring stations, and summary tables for the 1974 Black Hills value survey. (Coan-NC)

FEASIBILITY OF A SYSTEMATIC APPROACH TO WATER QUALITY MANAGEMENT IN ILLINOIS,
Illinois Univ. at Urbana-Champaign. Inst. for Environmental Studies.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 561, Price codes: A07 in paper copy, A01 in microfiche. Illinois Institute for Environmental Quality, Chicago Report No. 77/35, October 1977. 139 p. 20.083.

Descriptors: *Water quality management(Applied), *Water quality, *Water use, *Water quality control, *Water pollution, *Illinois, Water pollution control, Water pollution sources, Recreation, Withdrawal, Environmental quality, Water quality standards, Effluent standards, Non-point pollution, Stream/lake classification system.

This is an investigation of the feasibility of developing a more systematic water quality management scheme for the State of Illinois. This management scheme would: (1) determine actual and potential stream uses; (2) determine stream standards and water quality criteria required to meet those uses; (3) evaluate the current water quality record to determine where the uses are not being supported by adequate water quality; (4) assess amount of water quality improvement necessary; (5) define principal contributors to water quality; (6) determine upgrading methods to be applied, their effectiveness and costs. The report describes the theory and rationale behind the water quality management concept. The feasibility of identifying water uses and related standards are described; as well as the feasibility of using historical water quality records in support of the stream/lake classification system and the feasibility of determining methods, costs, and effectiveness of upgrading strategies. The principal thrust of the research is to reorganize existing water quality data in order to shed new light on the state's water quality problems and on opportunities for improvement. The report discusses the present ability to predict the impacts of controlling agricultural sediment, nutrient and chemical contamination of surface waters. Non-point pollution from mining and construction sites is evaluated. A case study of three basins is presented, and needed research and future directions discussed. (Coan-NC)

ENVIRONMENTAL BASELINE DESCRIPTIONS FOR USE IN THE MANAGEMENT OF FORT CARSON NATURAL RESOURCES. REPORT 2: WATER-QUALITY, METEOROLOGIC AND HYDROLOGIC DATA COLLECTED WITH AUTOMATED FIELD STATIONS,
Army Engineer Waterways Experiment Station, Vicksburg, MI. Mobility and Environmental Systems Lab.
H. W. West, and H. M. Floyd.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A046 827, Price codes: A04 in paper copy, A01 in microfiche. Technical Report M-77-4, September 1977, 74 p, 9 tab, 1 appendix. 4A162121A896.

Descriptors: *Water quality, *Natural resources, *Hydrologic data, *Meteorologic data, *Fort Carson(CO), Instrumentation, Measurement, Hydrology, Water resources, Wildlife, Wind Velocity, Environmental data, Environmental management, Military installations.

This report is second in a series of six reports describing methodologies and procedures to collect environmental baseline data that are pertinent to the Fort Carson, Colorado Long-Range Environmental Program. The U.S. Army Engineer Waterways Experiment Station (WES) was instructed to acquire water-quality, meteorologic, and hydrologic data to assist in determining the characteristics of the surface waters that exist on or pass through the installation and to provide quantitative data to support the installation's natural resource management programs. The report describes what the water quality, meteorologic, and hydrologic parameters were, the rationale for selecting the parameters, and the methods and frequency of the measurements. Tables show sites selected for the various measurements, the dates for the data collection period, and the results for the various measurements. Preliminary analyses were made of some of the data collected on water quality, meteorologic, and hydrologic conditions, and comparisons were made with the state of Colorado water-quality standards and surrounding meteorologic conditions as observed at nearby weather stations. All sensors used by WES at Fort Carson for environmetal data collection, together with appropriate mathematical conversions of the raw field data into engineering units, are described in the appendices. These data include rainfall measurement, solar radiation, air temperature, wind speed, wind direction, water quality sensors, and water conductivity. (Coan-NC)

WATER DISTILLER,
J. D. Kirschmann.
U.S. Patent No. 4,135,984, 11 p, 7 fig, 8 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 4, p 1376, January 23, 1979.

Descriptors: *Patents, *Water treatment, *Water purification, *Water quality control, Demineralization, Separation techniques, Distillation, Condensation, Equipment.

A bottom boiler unit and a top condensing unit are utilized to provide distilled water at a desired temperature level. The condensing unit comprises a vessel in which supply water is maintained at a predetermined level in heat exchange relation with steam passing through a circuitous, tubular passage from the boiler, with the result that the steam is cooled and condensed to distilled water which is directed outward from the unit through a fluid outlet. Steam rising from the bottom boiler unit is directed to the top of the circuitous tubular passage in the condensing unit so that condensing and cooled vapors flow downward in the circuitous flow passage toward the fluid outlet for distilled water and a temperature gradient is maintained in the supply water contained in the condensing vessel. The cool supply water is located at the bottom of the condensing vessel, and preheated supply water at a higher temperature will be at the top of the condensing vessel for introduction into the flow tube extending downward into the boiler vessel. An adjustable thermostat in the condensing unit regulates the flow of supply water in response to the temperature of outgoing distilled water. A mineral water discharge passage is provided in the lower portion of the boiler vessel. The discharge passage is sized and shaped to provide a predetermined restriction to the outflow of residue water which prevents the accumulation of minerals and other impurities. (Sinha-OEIS)
W79-07399

AEROSOL DISPERSION OF MICROORGANISMS TO ELIMINATE OIL SLICKS,
K. Bisa, and T. Bisa.
U.S. Patent No. 4,136,024, 13 p, 6 fig, 12 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 4, p 1389, January 23, 1979.

Descriptors: *Patents, *Oil pollution, *Oil spills, *Water pollution treatment, Microorganisms, Microbial degradation, Water quality control, Aerosols, Dispersion, Hydrocarbons.

A method for the elimination of contamination caused by hydrocarbons on water surfaces, such as the ocean and other surface waters is described. Microorganisms, in particular bacteria, capable of degrading hydrocarbons are released into the atmosphere, together with suitable culture media, at a predetermined height above the contaminated area, in the form of aerosols in clouds that are heavier than air so that they gradually settle by gravity onto the contaminated surface. Discharging the microorganisms together with culture

media in a fine dispersion is advantageous as the microorganisms form a finely dispersed aggregation with the particles of the culture medium, and thus are able to remain for longer periods of time in the air. A several-fold increase in bacteria growth is thus accomplished before the microorganisms deposit on the hydrocarbons. This shift in effective concentration ratios in favor of the microorganisms makes it possible to adequately eliminate contaminating hydrocarbons even in relatively large areas. (Sinha-OEIS)

APPARATUS FOR COLLECTING EFFLUENT OIL,
Mitsubishi Jukogyo Kabushiki Kaisha, Tokyo (Japan). (Assignee).
Y. Seike, Y. Matsuo, M. Nakashima, T. Shojima, and S. Masaaki.
U.S. Patent No. 4,136,030, 17 p, 14 fig, 6 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 4, p 1391, January 23, 1979.

Descriptors: *Patents, *Oil pollution, *Oil spills, *Water pollution treatment, *Water quality control, Boats, Weirs, Separation techniques, Equipment, Oil recovery.

Improvements are made in the known apparatus for collecting effluent oil. The apparatus includes a pair of left and right side plates, a weir plate mounted to the side plates inclined in a rear-downward direction under a water surface, a slant plate with its rear end positioned above the rear end of the weir plate, and an oil leakage preventing plate positioned in the midway between the rear end of the weir and the rear end of the slant plate to form a water discharge port and to form an oily water intake port. The improvements are that only an oily water layer in the vicinity of a water surface can pass into the oil pool beyond the top edge of the weir and slant plate, and an oil leakage preventing plate. A pair of wave buffer chambers of cylindrical shape absorb and attenuate kinetic energy possessed by the wave of the oil and water flowing into the oil pool. (Sinha-OEIS)
W79-07406

LIQUID TREATMENT APPARATUS,
D. A. Bakken, R. A. Henderson, and E. J. Tischler.
U.S. Patent No. 4,136,032, 10 p, 30 fig, 7 ref; Official Gazette of the United States Patent Office, Vol. 978, No. 4, p 1391-1392, January 23, 1979.

Descriptors: *Patents, *Water softening, *Water treatment, *Flow control, Automatic control, Valves, Equipment, Water quality, Regeneration.

Water softening apparatus using ion exchange resin particles must be regularly regenerated with brine in order to restore or maintain the water hardness removing capacity of the resin particles. The flow control valve for such apparatus must accurately control the volume and velocity of liquid flowing through the particles and the brining system during four or more cycles. The apparatus has to be capable of operating under a wide range of pressure, flow, and hardness conditions. A flow control valve for multicycle liquid treatment apparatus has a pair of rotatable, slotted circular discs at its opposite ends. Rotation of the discs causes the slots to be selectively aligned with various ports, passages, holes and channels so as to control the direction and duration of liquid flow during the different cycles of the apparatus. (Sinha-OEIS)

FERTILIZERS AND PESTICIDES IN RUNOFF AND SEDIMENT FROM CLAYPAN SOIL,
Missouri Water Resources Research Center, Columbia.
G. E. Smith, R. Blanchar, and R. E. Burwell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 181, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, May 1, 1979. 67 p, 7 fig, 14 tab, 15 ref, 1 append. OWRT B-099-MO(1).

Descriptors: *Fertilizers, *Pesticides, *Runoff, *Sedimentation rates, *Nitrogen, *Phosphate, Crop response, Crop production, Corn, Soybeans, Soil treatment, Soil types, Agriculture, Cultivated land, Erosion, Cultivation, Land management.

Instrumented field plots were used to determine losses of nitrogen, phosphates and some pesticides from runoff in corn and soybean production over a period of seven years. The losses were related to the amounts of these elements applied as fertilizers, and where the applications were in excess of crop needs the losses were substantial. Runoff and sediment losses of these nutrients were higher where fertilizer additions were insufficient for vigorous crop growth, than where optimum amounts of fertilizer were used. Nitrogen losses in runoff water were about 8% of the applied optimum amount of ammonium nitrate, and the nitrogen in precipitation for some storm events was greater than in runoff. The nitrogen lost on an annual basis was greater than that added from the atmosphere. Phosphorous fertilizer applications in excess of the amount needed increased the total phosphate in runoff; phosphate in runoff was less where plots received optimum nitrogen treatments. Where good crop and soil management controlled erosion the amount of available phosphate absorbed on sediment and lost in suspended material was small. Herbicide and insecticide losses in runoff were associated with storm events occurring soon after application; small quantities were lost in later runoff events. Soil fertilization promoting early, vigorous crop growth resulted in less loss of the nutrients and reduced sediment loss. (Davison-IPA)
W79-07422

CONTROLLED RECHARGE OF WASTE WATER FOR AQUIFER PROTECTION AND PRODUCTION OF RENOVATED WATER,
Science and Education Administration, Phoenix, AZ. Water Conservation Lab.
H. Bouwer, R. C. Rice, J. C. Lance, and R. G. Gilbert.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 441-447, 1977. 1 fig, 18 ref.

Descriptors: *Waste water(Pollution), *Aquifers, *Protection, *Recharge, *Groundwater, Infiltration, Nitrogen, Phosphorus, Organic carbon, Pathogens, Renovated water, Reuse, Costs, Water quality.

Groundwater recharge with controlled infiltration of waste water and extraction of renovated water can be an effective technique for renovating municipal and other waste water, while minimizing contamination of native groundwater. Infiltration is accomplished with basins or other facilities. Application and resting periods and infiltration rates are selected to yield the optimum combination of quantity and quality of renovated water. Wells or drains for collecting the renovated water are located far enough away from the infiltration system to provide sufficient time and distance of underground travel in relation to the intended use of the renovated water. Well-designed and well-operated systems should be capable of producing renovated water free from pathogens and with greatly reduced nitrogen and phosphorus concentrations. The water can be re-used for unrestricted irrigation, recreation, and industrial purposes. Potable use of water should be discouraged, unless refractory organics are removed or proven harmless. 6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

HYDROLOGIC MODELING AND DATA REQUIREMENTS FOR ANALYSIS OF URBAN STREAMFLOW MANAGEMENT ALTERNATIVES,
Washington Univ., Seattle. Charles W. Harris Hydraulics Lab.
G. J. Kemp, and S. J. Burges.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 499, Price codes: A07 in paper copy, A01 in microfiche. Technical Report No. 57, November 1978. 130 p, 6 fig, 8 tab, 103 ref, 1 append. OWRT A-092 WASH(1). 14-34-0001-8051.

Descriptors: *Model studies, *Hydrologic systems, *Water resources development, *Planning, *Urban hydrology, *Watershed management, Runoff, Rainfall, Forecasting, Streamflow, Streamflow forecasting, Hydrology, Hydrographs, King County, Snohomish County(Washington), Stanford Watershed Model.

Continuous simulation hydrologic modeling is one approach to the incorporation of empirical knowledge of watershed dynamics into planning at the land development and total watershed levels for analyzing urban runoff strategies. In developing the use of this type of model for King and Snohomish Counties, Washington, personal interviews were used to identify the modeling needs and desires of potential model users and their perceptions of models. The literature was reviewed for professional modelers perceptions which were compared with those of the potential users. The development of evaluative criteria for local use of continuous simulation models is presented. From the examination of the general characteristics of several continuous simulation models it was found that variations of the Stanford University Model (SWM) were the only models possessing the desired characteristics. These are evaluated in detail as a group. It is concluded that the SWM provides better information than more commonly used methods. The Hydrocomp Simulation Processor II is recommended for implementation as the model best suited for this specific location. Its primary limitation is its demand for data, particularly rainfall records, and the associated cost of data development and handling. (Davison-IPA)

A decision making method labeled Protrade has been developed to account for both multiple objectives and uncertainty aspects. This method is applied to the case study of the Black Mesa Region in Northern Arizona which is being strip mined for coal. One important concern in large-scale surface

mining is the reclamation of mine spoils to bring about beneficial land uses while observing economic, social, environmental, and legal constraints. Protrade considers a set of linear objective functions with random parameters, subject to a set of physical constraints; the preferences of the decision maker are articulated in a progressive manner, and alternative solutions are generated. Nonlinear deterministic equivalents are introduced to account for uncertainty in some of the parameters involved. While no final policy recommendations are made, this illustration of Protrade is carried out to investigate the potential of the method for trading off multiple objectives and measures of uncertainty in water and other natural resource system design problems. SIMULATION OF THE URBAN RUNOFF PROCESS,
Snowy Mountains Engineering Corp., Canberra (Australia).
D. C. Black, and A. P. Aitken.
Australian Water Resources Council, Canberra, Department of National Resources, Technical Paper No. 26, 1977. 120 p, 7 append, 14 fig, 9 tab.

Descriptors: *Hydrologic models, *Simulation, *Models, *Water resource planning, *Stage-discharge relations, *Australia, *Canberra, *Melbourne, *Urban catchment models, Hydrographs, Flood peaks, Urban runoff, Flood forecasting, Urban hydrology, Rainfall-runoff relationships, Infiltration, Hydrologic data, Data processing, Catchment basins.

This report describes the application of the Australian Representative Basins Model (ARBM) and Hydrocomp Simulation Programming (HSP) to two urban catchments in Australia, one in Canberra and one in Melbourne. Part A of the paper describes the details of the investigations and recommends the further use of ARBM in Australian cities. Included in part A is a general discussion of urban catchment models, their definitions, classification, types and data requirements. Summary statistics on flood peaks, daily runoffs and monthly runoffs are presented, with explanations for the differences between observed and predicted values. A description of the ARBM and HSP models is presented and their differences are illustrated by flow diagrams, diagrammatic sketches, and listed subroutines. Part B describes the origins and features of the ARBM model. The model is designed to simulate the behavior of the land phase of the hydrological cycle for small catchments. The model consists of four main sections: (1) the catchment water balance procedure; (2) the runoff routing method; (3) the statistical tests comparing estimated and observed runoffs; and (4) the plotting of hydrographs. Flow charts, variables, data input streams, output details, and program listings are used to examine features of the model and are listed in appendices. The most important conclusion of the report is that simulation of the rainfall-runoff process for urban catchments is useful in Australia but is an expensive tool to use. (Coan-NC)

EFFECTS OF URBANIZATION AND INDUSTRIALIZATION ON THE HYDROLOGICAL REGIME AND ON WATER QUALITY.
Proceedings of the Amsterdam Symposium, October 1977, convened by UNESCO and organized by UNESCO and the Netherlands National Committee for IHP in cooperation with IAHS. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, 1977. 572 p.

Descriptors: *Effects, *Urbanization, *Industrialization, *Hydrologic regime, *Water quality, *Water policy, Urban hydrology, Design, Management, Planning, Hydrologic cycle, Atmospheric aspects, Surface waters, Groundwater, Water supply, Methodology, Water conservation, Water pollution, Water reuse, Optimization, Simulation analysis, Equations, Analytical techniques, Mathematical models, Systems analysis.

This conference was organized by UNESCO and the Netherlands National Committee for the International Hydrological Programme (IHP) in cooperation with IAHS. The 63 papers submitted for the plenary sessions of the Symposium are contained in this volume and refer to the following themes: (1) the effects of urbanization and industrialization on the hydrological regime; (2) the effects of urbanization and industrialization on water quality; and (3) water policy as a factor in urbanization and industrialization. Dealt with are: effects on the atmospheric part of the hydrological cycle; effects on surface and ground water; water supply and methodology for water conservation; pollution of surface and ground water; water reuse; and measures to be taken for optimizing reuse. The authors demonstrate a serious involvement with urban hydrology as a distinct branch of the broad field of hydrology. The hydrological effects of urbanization and industrialization need still more attention from scientists and from those responsible for design and management of water systems. MATHEMATICAL MODEL SYSTEM FOR CONTINUOUS OPERATIONAL CONTROL OF RIVER FLOW AND SALT CONCENTRATION IN AN INDUSTRIALIZED RIVER BASIN,
Institut fuer Wasserwirtschaft, Berlin (German, D.R.).
A. Becker, and P. Sosnowski.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 191-198, 1977. 3 fig, 13 ref.

Descriptors: *Model studies, *Simulation analysis, *Real-time control, *River flow, *Salt concentration, *Reservoirs, *Forecasting, *Computer programs, *Operating rules, River basins, Industries, Water supply, Methodology, Flood control, Data transmission, Waste water storage, Long-term planning, Short-term planning, Equations, Operations research.

To guarantee the water supply for a system of big industrial consumers and other consumers in the Saale River basin as well as flood control, the continuous control of river flow and salt concentration of the main rivers is necessary. This control is normally on a daily basis, but under critical conditions it is based on 12 h or 6 h intervals. For this purpose a comprehensive simulation planning model system and data transmission system have been developed which make it possible to: (1) forecast the river flow and salt concentration of the main rivers continuously; and (2) calculate the optimum real-time control of the existing reservoirs and of a salt waste water storage system. The function and the general structure of the mathematical modeling system are described. (See also W79-07426) (Bell Graf-Cornell)

THE IMPACT OF SEWER SYSTEM OVERFLOWS ON RECEIVING WATERS AS DEFINED BY MATHEMATICAL MODELLING,
Dorsch Consult, Munich (Germany), F.R.).
W. F. Geiger.
In: Effects of Urbanization and Industrialization on the Hydrological Remime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 303-310, 1977. 3 fig, 1 tab, 5 ref.

Descriptors: *Water pollution, *Overflow, *Computer models, *Simulation analysis, *Effects, Storm runoff, Assessment, Decision making, Precipitation, Statistical methods, Receiving waters, Sewer systems, Systems analysis, Urban runoff, Hydrology, Water quality.

Storm runoff causes the same magnitude of pollution loads entering receiving waters as secondary treatment effluent. The impact of these loadings is intermittent and cannot be defined with reasonable costs by measurements only. Computerized mathematical simulation models have been recognized as aids to the assessment of pollution loads and decision making in selection of overflow abatement alternatives. But, as the processes involved in urban runoff have statistically those properties of random events, it follows that meaningful and realistic conclusions on urban runoff and its pollution can only be derived from the investigation of long precipitation records. For a simulation model, sufficient detail is necessary to represent the rapidly varying runoff processes. In addition to monthly and yearly totals, statistical analyses of continuous simulation results provide frequencies and durations of overflows and overflowing pollution loads. These results assess the impact of sewer system overflows on receiving waters. Predicting the impact of future conditions, a technical basis for cost-benefit considerations is provided supporting storm water management decisions. (See also W79-07426) (Bell Graf-Cornell)
W79-07458

THE STRUCTURE OF THE DECISION-MAKING PROCESS WITHIN THE WATER RESOURCES MANAGEMENT SYSTEM,
Provinciale Waterstaat van Gelderland, Arnhem

(Netherlands).
Th. J. van de Nes.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 529-542, 1977. 6 fig, 3 ref.

Descriptors: *Water policy, *Decision making, *Water resources, *Management systems, *Hierarchical analysis, Mathematical models, Systems analysis, Water supply, Water management(Applied), Water distribution(Policy), Water purification, Planning, Gelderland(Netherlands), Surface waters, Groundwater.

The instruction to the Committee for the Study of Water Resources Management in Gelderland runs as follows: 'creation of a scientific base for an optimal management of the surface and ground waters available in Gelderland with regard to their quantity and quality'. A first attempt has been made to analyze the water resources management system as a whole on a regional scale. The large-scale and complex character of the system necessitates the involvement of many disciplines in the study. On the one hand, this causes problems of communication between the various disciplines and on the other hand, problems of transfer of knowledge to management. Solving these problems with the aid of the theory concerning hierarchical systems has been tried. This approach enables the dissolution of the complex system into a number of subsystems without losing sight of their mutual dependence. In this approach, the water resources management system is divided into a number of levels that are studied with the aid of mathematical models. Thus, the complex decision process is divided over various levels, so that it can be solved more efficiently. The way in which the results can be used in the planning of water resources management gives an insight into the structure of the decision process. (See also W79-07426) (Bell Graf-Cornell)
W79-07484

IMPACT OF URBANIZATION ON REGIONAL AND NATIONAL WATER PLANNING AND MANAGEMENT,
Hydrologic Engineering Center, Davis, CA.
E. A. Stallings.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 543-549, 1977.

Descriptors: *Effects, *Urbanization, *Alternative planning, *Water management(Applied), Regional development, National, Water plans, Mathematical models, Projects, Evaluation, Impact assessment, Measurement, STORM model, Systems analysis.

There are four major steps in the development of a regional water plan and the corresponding effects due to urbanization. The first two steps are problem identification and formulation of alternatives with the corresponding development of problem solutions. The next step in the planning process involves the impact assessment which introduces the mathematical modeling process. The final phase is evaluation which will discuss the effects both with and without the project. Finally, a description of the important trade-off analysis in the planning process and the relationships as effected by urbanization is given with examples from actual on-going projects. QUASI-SYSTEMS APPROACH TO WATER QUALITY PLANNING FOR URBAN BASINS: A MODEL FOR POLICY EVALUATION,
Virginia State Water Control Board, Richmond. Piedmont Regional Office.
P. Das.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 565-572, 1977. 2 fig, 10 ref.

Descriptors: *Long-term planning, *Water pollution control, *Optimization, *Simulation analysis, *Economic impact, *Environmental effects, *Cost minimization, Management, Surface waters, Basins, Urbanization, Water quality, Mathematical models, Systems analysis, Capacity expansion, Waste water(Pollution), Sewage treatment, Treatment facilities, Municipal wastes, Industrial wastes, Standards, Pollutants, Evaluation, Point source pollution, Module approach.

A systematic methodological approach to the long-term planning and management for surface water pollution control in a small basin undergoing urbanization is presented. A number of water quality components including biological oxygen demand, total phosphorus and total suspended solids attributed jointly to municipal and industrial point sources and through urban storm water runoff are considered. The mathematical models developed include: (1) a parametric simulation model to study the urban storm water runoff pollution problem; and (2) an optimization model for least-cost capacity expansion and operational planning for point source waste water and storm water sewage treatment plants. The outputs from the simulation model constitute the inputs to the optimization model. Since the urban runoff pollution problem is truly a large-scale and complex system, a module approach is utilized for simulation. The modules are grouped into two submodels, one containing storm water quantity modules and the other containing quality modules. The optimal levels of pollutants removed in the municipal and industrial waste water and storm water sewage treatments plants are then determined for a parametric set of storm quality standards related to each pollutant. HYDRO POWER: ECONOMIC COMPARISONS,
MITRE Corp., Bedford, MA.
P. R. Vance, and L. C. Bryan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 694, Price codes: A03 in paper copy, A01 in microfiche. Technical Report No. MTR-3394, December 30, 1976. 33 p, 9 fig, 1 tab, 6 ref, 1 append. 367A. CG-00007.

Descriptors: *Electric power costs, *Electric power plants, *Hydroelectric plants, Economic prediction, Costs, Cost comparisons, Capital costs, Operating costs, Maintenance costs, Fuel costs, Fuels, Fossil fuels, Coals, Oil, Nuclear power-plants, Cost analysis, Equations.

Production cost equations for hydro generation and for fossil-fired alternatives are developed. The inflation of fuel, capital, and labor costs were taken into account in determining the generation cost of power produced by these types of plants. A cost comparison is made of the 15 year period prior to the oil embargo of October 1973 and the first 15 years of operation of the plants currently in planning. The results show that the economic competitive position of hydroelectric generation has greatly improved because of the escalation of fuel costs. It is concluded that many potential hydro projects, formerly uneconomic, may now be considered economically sound. (Davison-IPA)

GUIDANCE FOR SEWER SYSTEM EVALUATION,
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 451, Price codes: A02 in paper copy, A01 in microfiche. Report EPA/520/9-74/018, 1974. 10 p, 1 fig, 1 append.

Descriptors: *Evaluation, *Sewerage, *Infiltration, *Rehabilitation, *Inflow, *Rehabilitation, Inspection, Design, Municipal wastes, Industrial wastes, Waste water treatment, Performance, Surveys, Cleaning.

Guidance is provided to engineers, municipalities, and regulatory agencies on sewer system evaluation of infiltration/inflow. Infiltration occurs when existing sewer lines undergo material and joint degradation and deterioration as well as when new sewer lines are improperly designed and constructed. Inflow occurs when rainfall enters the system through direct connections. Both reduce the capability of municipal and industrial systems to transport and treat waste water. Evaluation methods are described including physical survey, rainfall simulation, preparatory cleaning, internal inspection, and survey report. The final phase of the evaluation results in a survey report of data gathered during the survey and a justification for each sewer section cleaned and inspected. A rehabilitation program to eliminate all defined excessive infiltration/inflow is also part of the final phase. (Small-FRC)

COST-EFFECTIVENESS STUDIES OF SANITARY SEWERAGE SYSTEMS METHODOLOGY AND DEMONSTRATION,
Veenstra and Kimm, West Des Moines, IA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-253 372, Price codes: A06 in paper copy, A01 in microfiche. Report, 1974. 108 p, 10 fig, 27 tab.

Descriptors: *Cost analysis, *Cost comparisons, *Sewerage, *Interceptor sewers, *Economics, Project planning, Sewers, Routing, Waste water treatment, Municipal wastes.

Methodologies and demonstrations of three cost-effectiveness studies of sanitary sewerage systems are presented. The first study is a cost comparison associated with eliminating extraneous flow problems in existing sanitary sewer systems. Six alternate solutions are demonstrated and the estimated project cost and present worth of each alternate system are calculated. The second study presents a cost comparison associated with selecting interceptor sewer routes. Two alternate plans are compared for estimated project costs and present worth. The third study compares the costs associated with waste water treatment for outlying communities in metropolitan areas. Four alternate plans are developed and compared for estimated project costs and present worth. (Lisk-FRC)

ECONOMIC VALUE OF BENEFITS FROM RECREATION AT HIGH MOUNTAIN RESERVOIRS,
Colorado State Univ., Fort Collins. Water Resources Research Inst.
R. G. Walsh, R. Aukerman, and D. Rud.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 636, Price codes: A02 in paper copy, A01 in microfiche. Technical Report No. 14, December 1978. 18 p, 1 fig, 8 tab. OWRT A-036-COLO(1). 14-34-0001-8006.

Descriptors: *Recreation demand, Economics, Water demand, Recreation facilities, *Reservoirs, Public lands, Instream flow.

This study developed and applied a procedure for measuring recreation benefits of high mountain reservoirs. Two hundred people were interviewed at 12 high mountain reservoir sites on the Front Range of Colorado during the summer of 1978. The 12 study sites represented the range in size from 10 to 400 acres and other characteristics such as road or trail access and facilities, typical of reservoirs located at 6,000 to 11,000 feet elevation along the Front Range of Colorado. For comparison, 40 boaters were interviewed at two reservoirs located in the foothills of the Front Range at 5,000 to 6,000 feet elevation. Each recreation participant was asked for an estimate of his or her direct out-of-pocket costs in making the trip. Direct costs associated with the activities were identified easily. This was followed by a surplus value question, which asked respondents to consider the maximum worth of their recreation experience, defined as the increase in total trip expenses above which they would decide not to participate, given water level and crowding level as they existed on the day of the interview. Respondents were then asked to estimate how their participation and value would change with changes in the current water level to five threshold levels: 100, 75, 50, 25 and zero percent of maximum bankful. Thus, respondents were asked to consider each of these water levels as unique recreation resources, with the expectation that each would have a distinct demand.

THE OKAVANGO DELTA: PLANNING FOR THE FUTURE,
Zululand Univ., Empangeni (South Africa). Dept. of Botany.
P. Reavell.
South African Journal of Science, Vol. 74, No. 5, p 165-167, May 1978. 1 fig.

Descriptors: *Planning, *Natural resources, *Water resources, *Water resources development, *Okavango Delta(Botswana), Fisheries, Water utilization, Conservation, Environmental effects, Industrial water, Animal diseases.

A symposium from August 30 to September 2, 1976 on the future management of the Okavango Delta at Gaborone, Botswana, is reviewed. The topics covered included: wildlife; tourism; game and trophy hunting; the possibility of combining cattle farming with game ranging; cattle husbandry; the eradication of such diseases as nagana and foot-and-mouth; aquatic resources; a fishing industry; water for industry; possible engineering changes to the hydrological regime; and exporting water to bordering countries. Specific changes likely to occur in the delta regardless of man's intervention are examined. (Davison-IPA)

METHANE FROM GEOPRESSURED AQUIFERS STUDIED,
University of Southern California, Los Angeles.
T. M. Doscher, R. H. Osborne, S. W. Rhee, T. Wilson, and D. Cox.
The Oil and Gas Journal, Vol. 77, No. 15, p 178-183, April 9, 1979. 4 fig, 1 tab, 5 ref.

Descriptors: *Methane, *Geopressured aquifers, *Economic feasibility, *Brine disposal, Brines, Productivity, Cost analysis.

The economics of producing methane from geopressured brines beneath the south Texas Gulf Coast are examined. The economic limit for production from such reservoirs was assumed to be reached when bottom hole pressure fell to that corresponding to a hydrostatic head to the surface. It was necessary to assign probable values to the reservoir parameters in order to solve the pseudo-steady-state flow equations for an average sustained production rate over a predetermined lifetime. Two parameters that could not be well defined are the compressibility and the size and configuration of the reservoir. The overall results of the cost calculations indicate that the cost of methane recovered from geopressured aquifers could be reduced to $4/Mscf only if reservoir volumes were in excess of 1 cu. mile and the optimistic estimates of operating costs prevailed. For the more likely reservoir volumes, the costs would be in excess of $10/Mscf. It does not appear likely that methane recovered from geopressured aquifers can be a competitive supply of energy in the United States for many generations to come. (Purdin-NWWA)

CONCEPTS OF VALUE FOR WATER-BASED RECREATION OPPORTUNITIES,
Illinois Univ. at Urbana-Champaign. Agricultural Experiment Station.
J. F. Dwyer, and M. D. Bowes.
Water International, p 11-15, September 1978. 1 fig, 15 ref. OWRT C-7525 (No. 6237) (2).

Descriptors: *Cost-benefit analysis, *Recreation demand, Economics, Recreation planning, Value, Planning, Resource allocation, Model studies.

Willingness-to-pay is the appropriate concept for fee-setting when new recreation sites are created by an alternative plan, and willingness-to-sell (WTS) rights to those opportunities (or the minimum compensation required to bid land and water resources away from present uses) is the appropriate valuation concept for lost recreation output when an alternative plan destroys recreation opportunities or makes them unavailable in some other way. For privately owned resources the latter is often best reflected by the selling price of the land and related resources, while for public resources the minimum compensation required by present users of the area is the appropriate valuation concept. At present there is no generally satisfactory method for accurately evaluating WTS. The correct use of benefit-cost analysis is to compare generated gross benefits of a project (measured as total WTP) to the cost of bidding necessary resources away from alternative uses (WTS). WTP may be estimated by the area under the demand curve for the site in question. For lost net benefits from destroyed resources the area under the demand curve above cost is at best lower bound. While much effort has been devoted to modelling WTP for recreation opportunities, little has been directed toward WTS, or to explain wide differences between survey estimates of WTP and WTS. CLARENCE CANNON DAM AND RESERVOIR: COST, SCHEDULE, AND SAFETY PROBLEMS. CORPS OF ENGINEERS (CIVIL FUNCTIONS) DEPARTMENT OF THE ARMY,
General Accounting Office, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 114, Price codes: A03 in paper copy, A01 in microfiche. July 1977, 23 p, 1 fig, 3 tab, 3 append.

Descriptors: *Hydroelectric power, *Electric power costs, *Earth-fill dams, *Benefit-cost ratio, *Clarence Cannon Dam(MO), Dams, Impoundments, Project benefits, Missouri, Reservoir construction, Safety factors, Corps of Engineers.

This is a critique of the Corps of Engineers' Clarence Cannon Dam and Reservoir project in northeastern Missouri. When completed, the reservoir will have about 285 miles of shoreline, serving drainage areas of 2,300 square miles above the main dam and 600 square miles below the main dam. Project benefit-cost ratio was predicted to be 1.3:1 in 1975. The cost of the project has more than tripled since 1962 and scheduled completion has been delayed 8 years. GAO questioned both the economic and financial feasibility of the hydroelectric power project, and whether adequate foundation safety was incorporated in phase 1 of the reservoir construction during 1970-72. Some of the earthen fill material used in construction contained a higher than acceptable moisture level and, as such, would tend to make the foundation unstable. The GAO recommends that the Corps provide further data on the financial and economic feasibility of the project's hydroelectric power capability and evidence that defective fill material in the dam

has been satisfactorily replaced or repaired. It also recommends that the Secretary of the Army obtain an overall evaluation of the safety of the dam from an expert independent consultant. (Arnold-NC)

PROCEEDINGS, NORTH CAROLINA 208 PROBLEM ASSESSMENT WORKSHOP, MAY 4, 1977, RALEIGH,
University of North Carolina, Water Resources Research Institute Raleigh Report No. 125, N.D., 55 p.

Descriptors: Management, Planning, Public participation, *208 planning, *Project planning, *Water quality requirements, North Carolina.

Objective of the workshop was to identify 208 program requirements presenting significant technical challenges to the State and to determine whether these requirements can be met within the limitations of current capabilities. Workshop format began with brief presentations by 208 program participants. Each participant discussed his group's accomplishments to date, projected accomplishmets over next two years with the present level of technology, and problem areas where assistance is needed. The Proceedings contain a record of presentations and comments made at the workshop. (Kiger-North Carolina)

URBAN HYDROLOGY IN SWEDEN--AN INVENTORY OF THE PROBLEMS AND THEIR COSTS,
Chalmers Univ. of Technology, Goteborg (Sweden).
L. Carlsson, and J. Falk.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 478-487, 1977. 5 fig, 5 tab, 26 ref.

Descriptors: *Urban hydrology, *Water management(Applied), *Surface runoff, *Water transport, *Water budget, *Subsurface water, *Waste water(Pollution), Effects, Urbanization, Costs, Hydrologic cycle, Water supply, Sewerage, Overflow, Storm water, Land subsidence, Environment, Economic impact, Pipes, Treatment facilities, Water utilization.

A model of the water budget for urban areas has been constructed as a basis for dividing the urban hydrological cycle into three storage and three transport parts. Within each part, problems and costs of water management are described. The total cost for management of water supply and sewerage in Sweden is estimated to be about 5.5 million Swedish crowns/day. The largest problems from the environmental viewpoint are considered to be the management of storm water and overflows. From the economic stance, land subsidence due to lowering of the piezometric head is a great problem. Management of the storm water must be performed on the assumption that it is partly a resource which can be handled and used within the urban area. This has given rise to extensive research regarding quantity and quality of storm water together with field experiments on artificial infiltration of storm water. In order to prevent damage to buildings, roads, conduit systems, etc., due to land subsidence, instructions for underground planning and building are in preparation. In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 558-564, 1977. 3 fig, 4 tab, 5 ref.

Descriptors: *Urban drainage, *Flood control, *Benefits, Evaluation, Costs, Planning, Investment, Cost effectiveness, Probability density function.

In recent urban development, drainage and flood control projects have often lost out to higher priority public investments. These projects suffer from a lack of visibility and their full costs and benefits need to be carefully identified by the responsible officials. Distinctions should be drawn between major and minor systems. Current practice is to use a 'design storm' approach to planning. This fixed-effectiveness, minimum cost approach may not produce an optimum plan. Benefits and costs of projects are listed and classified as well as related to project objectives. The role of intangible benefits and costs is described. (See also W79-07426) (Bell Graf-Cornell)

AN ASSESSMENT OF THE FINANCIAL IMPACT OF FEDERAL GUIDELINES ON THE CANADIAN METAL FINISHING INDUSTRY,
Department of the Environment, Ottawa (Ontario). Water Pollution Control Directorate.
L. Buffa, and K. R. Coulter.
Economic and Technical Review Report EPS 3-WP-78-8, December 1978, 40 p, 2 fig, 7 tab, 6 ref, 1 app.

Descriptors: *Economic impact, *Cost analysis, *Financial feasibility, Legislation, Pollution abatement, Treatment facilities, Industrial production, Operating costs, Installation costs, *Metal Finishing Liquid Effluent Guidelines, *Metal Finishing Industries.

This report is an assessment of the ability of the Canadian metal finishing industry to absorb the cost of meeting the Metal Finishing Liquid Effluent Guidelines issued in November, 1977. Capital and operating costs for pollution abatement equipment are given in 1976 values. The increase in capital and operating costs can be estimated at approximately 15 percent for 1978 values. Only noncaptive, independent metal finishing installations have been assessed, on the assumption that captive operations which are only a part of a larger company will be able to meet the requirements with available financial resources. PROCEEDINGS, NORTH CAROLINA WORKSHOP ON WATER AND WASTEWATER PRICING, FEBRUARY 21, 1978, RALEIGH,
North Carolina State Univ. at Raleigh. Water Resources Research Inst.
N.D., 76 p.

Descriptors: *Wastewater, Pricing, *Water pricing, *Water management, Rate setting, Conservation.

Prices for water and wastewater services vary considerably between communities because each system is unique. Some factors which cause prices to vary include location of the supply, topography or terrain, age of the system, population density, type of consumer, area being served, growth, water quality and quantity, inflation and energy costs, fire facilities, general tax and level of treatment. The pricing of water and wastewater services is going up and utility managers need to be in a better position to explain new rate structures. New issues force us to review traditional approaches to rate setting. These issues include: inflation, growth management, government regulations, especially those associated with the Clean Water Act and the Safe Drinking Water Act, energy costs, chemical costs, and the need for conservation. This workshop raised issues related to establishing equitable rate structures which reflect the costs and services being provided and anticipated future needs. The general objective of the workshop is to provide a forum for leaders to discuss these issues and to hear experts discuss national pricing trends. Specific objectives were: to present information on advanced approaches to rate setting; to demonstrate the relationship between water and wastewater pricing; to discuss unique problems of pricing in North Carolina; to present practical methods for solving pricing problems; to determine needs for training, research and further workshops; and to present the opportunity to use water conservation as a management tool to reduce costs. WATER CONSERVATION VIA A VARIABLE PRICING MECHANISM,
Kentucky Univ., Lexington.
C. T. Haan, D. I. Carey, and O. C. Grunewald.
In: Effects of Urbanization and Industrialization on the Hydrological Regime and on Water Quality. Proceedings of the Amsterdam Symposium, October 1977. IAHS-AISH Publication No. 123, International Association of Hydrological Sciences, p 213-225, 1977. 3 fig, 2 tab, 16 ref.

Descriptors: *Water conservation, *Pricing, *Water supply, *Simulation analysis, *Stochastic processes, Water demand, Water rates, Water policy, Evaluation, Kentucky, Benefits, Costs, Equations, Mathematical models, Systems analysis, Alternative policies.

Increasing demands for water for urbanizing areas has demonstrated that it is no longer possible to meet 'all foreseeable demands' for water. Curtailment of water usage can be implemented through the pricing structure of the water to consumers. An increase in water rates has been shown to reduce the consumption of water. By using a variable pricing strategy it is possible to meet the demands for water when water is plentiful and yet to conserve water in times of shortage. The strategy consists of making water rates a function of available water so that the rates are low when water is in good supply and rates are increased when the supply is low. A policy of this nature has been shown to greatly reduce the capacity of a water supply system needed to meet the demands placed on it without greatly decreasing the amount of water supplied or increasing the average price of water. Various pricing policy alternatives are evaluated using a stochastic simulation analysis and a water price-demand relationship derived from more than 150 water districts in the state of Kentucky, USA. 6D. Water Demand

OPTIMUM WATER MANAGEMENT IN KAOLIN MINING FOR ALUMINUM PRODUCTION,
Georgia Inst. of Tech., Atlanta, GA.
J. E. Husted, F. G. Pohland, J. W. Wallace, and G. Dodson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 729, Price codes: A07 in paper copy, A01 in microfiche. Final Report SEGIT-78-178, November 1978. 126 p, 32 fig, 27 tab, 34 ref. OWRT C-7208 (No. 6229) (1), 14-34-001-6229.

Descriptors: *Kaolinite, *Strip mining, Georgia, Industrial water, Water demand.

The report is concerned with approximately 2700 square miles in east-central Georgia that includes parts of Glascock, Jefferson, McDuffie, Twiggs, Warren, Washington, and Wilkinson counties. Kaolin reserves for this area are estimated to be in excess of 3.5 billion short tons. An assessment of both groundwater and surface water resources includes piezometric surfaces, regional transmittivity, and potential drawdowns. Current water users and treatment facilities as well as waste water treatment facilities are also given. Projections are made of future water demand and waste water treatment impact. Water demand for processing alumina may range from 3 to 25 MGD, being dependent on process method and annual production rate of alumina that may vary between 300,000 and 1,000,000 short tons. Water in the northeast portion of the region is less abundant than in the central and southwest portions. Water should be sufficient for an alumina operation within 5 to 10 miles of a plant in the northeast and within a mile or less in other portions of the area.

RE-USE--THE ESSENTIAL ELEMENT IN WATER UTILIZATION,
Pretoria Univ. (South Africa).
F. A. van Duuren.
VELDTRUST, p 6-7, Autumn 1978, 2 fig.

Descriptors: *Water reuse, *Water utilization, *Competing uses, *Consumptive use, *Impaired water use, *Irrigation, *Industrial plants, Water quality, Water supply, Domestic water, Water consumption, Industrial water, Pulp and paper industry, Effluents, Reclaimed water, South Africa.

A system approach to the efficient utilization of available water supplies in South Africa is essential in prventing a potential water shortage. Because any use of water degrades it, its quality must be reviewed and quality requirements of subsequent reuse must be critically assessed. At the current population level of 24 million the domestic sector uses 7% of the available water supply; industry uses 18%, and agricultural irrigation uses the remaining 75%. When the population reaches 50 million domestic use will be at 15%, industry at 45% and irrigation at 40%. Since less than half of the water is used consumptively by the domestic sector, and only a small portion is used consumptively by industry, and virtually all agriculture use is consumptive, it is concluded that irrigation should not be allowed first draught on available water supplies. In urban perimeters where domestic effluent quality and the required quality of irrigation are equal, irrigation has become a secondary user of domestic effluent. Certain industries can also use domestic effluents. At the end of the century the domestic sector will be the smallest consumer, therefore it should be apportioned prime use of available supplies. Planned reuse of water in industry in South Africa is very extensive. The pulp and paper industry at Springs is an outstanding example of reuse of urban effluent. Its oxygen bleach process limits the addition of dissolved solids and thus enhances reuse of water. (Davison-IPA)

THE CHURCHILL DIVERSION: WATER QUALITY CHANGES IN THE LOWER CHURCHILL AND BURNTWOOD RIVERS,
Department of Fisheries and Environment, Ottawa (Ontario). Inland Waters Directorate.
R. A. Guilbault, W. D. Gummer, and V. T. Chacko.
Water Quality Interpretive Report No. 2, 1979, 9 p, 4 fig, 8 ref, 4 tab.

Descriptors: *Hydroelectric power, *Diversion, *Diversion losses, *Diversion dams, Alteration of flow, Water quality control, *Manitoba, *Churchill River, *Burntwood River, *Fidler Lake, *Granville Falls.

In June of 1976, Manitoba Hydro commenced operation of the Churchill River diversion, which is part of the Churchill-Nelson Hydroelectric Development Scheme. A statistical analysis of data obtained from a water quality monitoring network maintained in northern Manitoba by the Water Quality Branch indicates changes in the quality of both the lower Churchill and Burntwood Rivers. On the lower Churchill there is evidence of increases in turbidity, colour, total inorganic carbon, total phosphorus, hardness, calcium and aluminum. On the Burntwood River there is evidence of a decrease in calcium concentration and increases in total phosphorus, potassium and aluminum concentrations. A large number of parameters showed a change in their variability. The magnitude and cause of the water quality changes cannot be quantified precisely, since the data base used was not collected with this purpose in mind. Many of the results of this study are in agreement with the general predictions made in 1975 by the Lake Winnipeg, Churchill and Nelson Rivers Study Board. (WATDOC)

DEVELOPMENT DOCUMENT FOR INTERIM FINAL EFFLUENT LIMITATIONS GUIDELINES AND NEW SOURCE PERFORMANCE STANDARDS FOR THE MINERALS FOR THE CONSTRUCTION INDUSTRY. VOL. 1. MINERAL MINING AND PROCESSING INDUSTRY,
Environmental Protection Agency, Washington, DC. Office of Water and Hazardous Materials.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 593, Price codes: A13 in paper copy, A01 in microfiche. Report EPA 440/1-75/059, 1975. 280 p, 20 fig, 24 tab, 45 ref.

Descriptors: *Federal Water Pollution Control Act, *Standards, *Mine water, *Construction materials, *Waste water treatment, Minerals, Regulation.

Effluent limitation guidelines are proposed for the construction industry segment of the mineral mining indudtry for existing point sources and standards of performance and pretreatment standards for new sources. The limitations will implement Sections 301, 304, 306, and 307 of the Federal Water Pollution Control Act. The limitation guidelines set forth the degree of effluent reduction attainable through the application of the best available technology economically achievable and the degree of effluent reduction attainable through the application of the best practicable control technology currently available. Based on the application of best practicable technology currently available, six of the nine production categories (15 minerals) can be operated with no discharge of process generated waste water pollutants to navigable waters. This is also true for eight of nine subcategories with the best available technology economically achievable. No discharge is achievable as a new source performance standard for all production subcategories except mica, wet benefication process with ceramic clay as by-product. Supporting data and rationale for development of the proposed guidelines and standards of performance are included. (Small-FRC)

STATE LEGISLATIVE CONSTRAINTS ON THE DEVELOPMENT OF WATER RESOURCES POLICY,
West Virginia Univ., Morgantown. Dept. of Political Science.
D. C. Menzel.
Water Resources Bulletin, Vol. 14, No. 6, p 1331-1339, December 1978. 4 tab, 4 ref. OWRT A-032-WVA(2). 14-34-0001-7104.

Descriptors: *Legislation, *Constraints, *Water resources development, *Water policy, State governments, Institutional constraints, Political constraints, Water pollution, Decision making.

Legislative constraints on the development of water resources policy fit into three broad categories: political, institutional, and informational. The political category encompasses constituency needs and preferences, satisfaction with existing water management practices and policies, and the necessity for legislators to blend political ambition with public problem solving. Constraints fitting into the institutional category include differences in legislative behavior and attitudes that stem from one's location in the legislature (e.g., senate-house, leader-follower, or committee activity), the dynamics of scheduling and organization, and the capability to manage complex issues. Informational constraints refer to the availability of information and the use to which it is put by lawmakers in formulating decisions on water-related issues. These constraints are approached from a behavior perspective by examining several constituency, institutional, and information hypotheses that 'explain' legislative involvement with water resources issues. The data are drawn from a recent study of water resources decision making in West Virginia. Eighty-three of the 134 members of the 1975-76 West Virginia Legislature participated in the study. PRETREATMENT REGULATIONS FOR EXISTING AND NEW SOURCES OF POLLUTION,
Environmental Protection Agency, Washington, DC.
Federal Register, Vol. 43, No. 123, p 27736-73, June 26, 1978.

Descriptors: *Waste water treatment, *Industrial wastes, *Waste treatment, *Regulation, Treatment facilities, Standards, Environmental sanitation, Public utilities, Discharge(Water), Recycling, Reclaimed water.

This proposed rule of the federal Environmental Protection Agency (EPA) establishes mechanisms and procedures for enforcing national pretreatment standards controlling the introduction of nondomestic wastes into publicly owned treatment works (POTW's). The regulation's preamble and Appendix A describe the EPA's overall policy for establishing and enforcing pretreatment standards for new and existing industrial users of POTW's, and they delineate the responsibilities and deadlines applicable to each party. The intent of this regulation and the national pretreatment policy is to: (1) prevent the introduction of pollutants into POTW's which will (2) interfere with the POTW's operation or contaminate the sewage sludge and (3) pass through the treatment works into receiving waters or the atmosphere or otherwise be incompatible with the work; and (4) improve opportunities to recycle and reclaim wastewaters and sludge resulting therefrom. These pretreatment standards will include general discharge prohibitions applicable to all POTW users who discharge nondomestic wastes, as well as standards applicable to specific industrial categories. The discharge limits will be promulgated in separate regulations. (Greene-Florida)
W79-07231

LAND APPLICATION OF WASTEWATER AND STATE WATER LAW: AN OVERVIEW (VOLUME 1),
Wisconsin Univ.-Madison. Law School.
D. W. Large.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 120, Price codes: A04 in paper copy, A01 in microfiche. Report EPA 600/2-77-232, November, 1977, 60 p.

Descriptors: *Waste water disposal, *State governments, *Riparian rights, *Appropriation, Groundwater, Surface waters, Surface-groundwater relationships, Watercourses(Legal aspects), Competing uses, Analysis, Water rights, Water utilization.

State water rights laws and their possible impact on systems of land application of wastewater are discussed and analyzed. Most states have no regulations specifically controlling land application of wastewater. An analysis must be undertaken of basic state water law principles which have been mostly developed with entirely different water uses in mind. Several basic dichotomies could have some impact on the treatment of land application systems in different locations. The eastern 'riparian' states emphasize each riparian landowner's right along a watercourse to the use of water. The western 'appropriation' states emphasize that the right inures to the prior user of water. Most states in both the riparian and appropriation categories distinguish between 'natural watercourses,' 'surface water,' and 'groundwater,' with different legal considerations and results frequently occurring in different water categories in the same state. Occasional abstract legal requirements of absolute water purity, if literally applied, could pose adverse implications for innovative water uses. Most state water rights law contains enough flexibility, through its emphasis on encouraging 'reasonable' water uses, to enable land application systems to operate free from legal uncertainty. (Greene-Florida)

IMPROVEMENTS NEEDED BY THE WATER RESOURCES COUNCIL AND RIVER BASIN COMMISSIONS TO ACHIEVE THE OBJECTIVES OF THE WATER RESOURCES PLANNING ACT OF 1965,
General Accounting Office, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 552, Price codes: A02 in paper copy, A01 in microfiche. Report October 31, 1977, 14 p.

Descriptors: *Water resources planning act, *Comprehensive planning, *Future planning(Projected), Coordination, Water conservation planning, Reviews, Water management(Applied), Adoption of practices, Water resources development.

Failure of the federal Water Resources Council and state river basin commissions to meet the objectives of the 1965 Water Resources Planning Act and to develop coordinated and comprehensive national, regional and state plans called for under the Act, caused the Federal General Accounting Office to make three general recommendations. First, the Council and commission chairmen should jointly prepare guidelines for (1) preparation and review of comprehensive, corrdinated joint plans and priority reports and (2) clarification of the working relationships among the Council, commissions, state, and their members. At the least, these guidelines should include: (1) a description of the essential elements to be included in regional plans; (2) format so that plans may be compared among regions; and (3) procedure detailing how these plans will be reviewed, processed, and used at the various governmental levels. Secondly a more aggressive role should be taken in bringing unresolved matters to the attention of Council members for resolution. And thirdly, if the Council, commissions and their members should decide the issues in this report cannot be adequately resolved, then the Council chairman should propose legislation to establish an entity with the authority to accomplish the objectives of the 1965 Act. ADOPTION OF THE REASONABLE USE RULE IN NORTH CAROLINA FOR SURFACE WATER DRAINAGE BETWEEN ADJOINING LANDOWNERS,
R. M. Koch.
Wake Forest Law Review, Vol. 14, No. 4, p 866-81, August, 1978.

Descriptors: *North Carolina, *Surface drainage, *Judicial decisions, *Water rights, Surface runoff, Common law, Drainage effects, Civil law, Reasonable use, Drainage practices, Damages.

Three basic rules govern the rights of adjoining landowners with respect to the drainage of surface water: (1) the civil law rule; (2) the common enemy rule; and (3) the reasonable use rule. The common enemy rule states that 'surface water is recognized as a common enemy which each proprietor may fight off or control as he will or is able. No cause of action arises from such interference. The civil law rule states that a person who interferes with the natural flow of surface waters so as to cause an invasion of another's interests in

the use and enjoyment of his land is subject to liability to the other. The reasonable use rule allows each landowner to make a reasonable use of his land even though he alters the flow of surface water, thereby harming other landowners. North Carolina has traditionally followed a modified version of the civil law rule. However, in the 1977 case of Pendergrast v. Aiken the state's Supreme Court formally adopted the reasonable use rule as a guideline for settlement of future drainage controversies. (Goldberg-Florida)

FINANCIAL RESPONSIBILITY FOR WATER POLLUTION,
Federal Maritime Commission, Washington, DC.
Federal Register, Vol. 43, No. 156, p 35704-18, August 11, 1978.

Descriptors: *Oil pollution, *Cost repayment, *Regulation, *Navigable waters, Reimbursable costs, Insurance, Federal water pollution control act, Oil spills, Barges, Water pollution, Administrative agencies, Ships.

Part 542 of the Federal Marine Commission's rules has been revised to conform to the requirements of the 1977 Clean Water Act Amendments to the Federal Water Pollution Control Act. Part 542 establishes procedures whereby vessel operators may demonstrate the financial ability to meet their liability to the United States for the costs of removing oil and other polluting substances discharged into any waters over which the United States has jurisdiction. Vessels subject to these regulations must obtain Certificates of Financial Responsibility from the Commission in order to be authorized to use the navigable waters of the United States or any port or place therein. The various objections to and revisions of the proposed regulations are discussed in the supplementary information to the rule. Included in the finally adopted legislation are applicable definitions; the scope of the legislation; certificate application procedures, and requirements; how to establish financial responsibility for meeting liability; enforcement procedures, conditions that may result in denial or revocation; and other rule provisions. (Horwich-Florida)

WETLAND PROTECTION IN COMPLIANCE WITH NEPA,
Soil Conservation Service, Washington, DC.
Federal Register, Vol. 43, No. 127, p 28787-88, June 30, 1978.

Descriptors: *Wetlands, *Soil conservation, *Priorities, *Regulation, Aquatic life, Food and cover crops, Crop production, Drainage, Flood control, Assessments, Tidal marshes, Watershed management.

The rules proposed herein codify Soil Conservation Service (SCS) policy for compliance with Executive Order 11990, relating to the Protection of Wetlands in SCS assisted programs. The valuable functions of wetlands are described; for example, wetlands serve as flood-control mechanisms, water purifiers, nurseries for certain aquatic animal species, and ground-water recharge areas. On the other hand, many wetlands, if drained, could be used as prime cropland for the production of food and fiber. This proposed rule sets the policy guidelines to be used in balancing the needs for protection of environmental resources and the needs for food and fiber. An environmental assessment must be made in the early stages of planning, to identify effects of proposed actions that will occur in wetlands. Some factors to be weighed in the environmental assessment are the public health, safety, and welfare, including consideration of: water supply and flood hazards; the maintenance of natural systems; and other public uses of wetlands, such as recreational and scientific uses. (Horwich-Florida)
W79-07238

WATER QUALITY STANDARDS,
Environmental Protection Agency, Washington, DC.
Federal Register, Vol. 43, No. 132, p 29588-92, July 10, 1978.

Descriptors: *Water quality standards, *Pollution abatement, *Administrative agencies, *Standards, Water pollution, Water policy, Water pollution control, Water supply, Water utilization, Regulation, Water quality control, Pollution.

Water quality standards may form the basis for enforceable requirements under the federal Clean Water Act. Water quality standards may also form the basis for the areawide planning requirements under section 208 of the Act. Water quality standards may thus be translated into enforceable requirements not only for 'point' sources, but also for 'non-point' sources. The federal Environmental Protection Agency (EPA) here summarizes its current policy for development of water quality standards and its preliminary thoughts for a revised approach. A water quality standard for a particular water body (or segment) will generally consist of two elements: (1) a designated 'use' (such as public water supply, recreation, agriculture, etc.); and (2) 'criteria' for various pollutants, expressed in numerical concentration limits, sufficient to support the designated use. The EPA's contemplated approach would result in: (1) more stringent water quality standards than currently exist in many states; and in (2) water quality standards for many pollutants which are not subject to existing state standards. The EPA is currently contemplating a revised approach in order to assure achievement of the Clean Water Act's goals and to comply with a court order. (Fortin-Florida)
W79-07239

WATER QUALITY STANDARDS FOR NAVIGABLE WATERS IN MISSISSIPPI,
Environmental Protection Agency, Washington, DC.
Federal Register, Vol. 43, No. 135, p 30076-78, July 13, 1978.

Descriptors: *Mississippi, *Water quality standards, *Dissolved oxygen, *Legislation, State jurisdiction, Regulation, Water pollution control, Water quality control, Water quality, Pollution abatement, Pollutant identification.

In July, 1977, the federal Environmental Protection Agency (EPA) disapproved the dissolved oxygen criteria of the water quality standards adopted by the Mississippi Air and Water Pollution Control Commission for the state of Mississippi. The EPA herein proposes a rule establishing dissolved oxygen criteria for the navigable waters of Mississippi. Section 303 (c) of the federal Clean Water Act (Act) requires that the State water quality standards 'be such as to protect the public health or welfare, enhance the quality of water and serve the purposes of this act.' Among the more important quality criteria describing water quality suitable for the maintenance and propogation of fish's dissolved oxygen. The EPA criterion for dissolved oxygen recommends that the minimum daily dissolved oxygen not be less than 5.0 mg/1 to support a well balanced population of fish species. The EPA's proposed rule would establish a three-part standard. Current state standards for dissolved oxygen remain in effect until the EPA finally promulgates more stringent standards. The water quality standards applicable to intrastate, interstate, and coastal waters of Mississippi were subsequently amended on June 1978. (Fortin-Florida)
W79-07240

WATER QUALITY STANDARDS FOR NAVIGABLE WATERS OF ALABAMA,
Environmental Protection Agency, Washington, DC.
Federal Register, Vol. 43, No. 188, p 43741-43, Sept. 27, 1978.

Descriptors: *Water quality standards, *Pollution abatement, *Regulation, *Alabama, Water pollution, Water pollution control, Water supply, Water utilization, Pollution classification, Administrative agencies, Adoption of practices.

Section 303 (c) of the federal Clean Water Act provides that each state shall, at least once every three years, hold public hearings to reviewing water quality standards and to adopt revisions therein. Whenever a state revises or adopts new water quality standards, such standards must be submitted to the federal Environmental Protection Agency (EPA) for approval. If the standards are unacceptable to the EPA, the state has 90 days to re-adopt or re-amend them. Failing this, the EPA may enact interim standards for the state. This proposal is such an interim rule for Alabama. The EPA's proposed rule would establish a designated use classification of Fish and Wildlife for 23 stream segments. A significant difference exists between the water quality criteria associated with the Agricultural and Industrial Water Supply use. The EPA's proposed rule would also result in the application of a more stringent toxic substance provision than the one assigned by Alabama for the Agricultural and Industrial Water Supply use classification. Water quality standards will be achieved by the installation of point source abatement controls; by the application of more effective operation of existing point source facilities; or by the application of best management practices for non-point pollution sources. DREDGING AMERICA'S WATERWAYS AND HARBORS--MORE INFORMATION NEEDED ON ENVIRONMENTAL AND ECONOMIC ISSUES,
General Accounting Office, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 802, Price codes: A04 in paper copy, A01 in microfiche. Report to the Congress June 28, 1977, 64 p.

Descriptors: *Dredging, *Environmental effects, *Disposal, *Cost analysis, Economic feasibility, Alternative planning, Alternative costs, Water pollution sources, Rivers and harbors act, Adoption of practices, Regulation.

Concern has increased over possible environmental damage associated with the open water sediment disposal practices of the U.S. Army Corps of Engineers near waterway and harbor dredge sites. Alternatives to traditional disposal sites may reduce or eliminate suspected environmental risks, but they generally increase costs and affect the economic feasibility of projects. The 1970 Rivers and Harbor Act directed the Corps to research the effects of, and alternatives to traditional disposal practices. Preliminary research results indicate open water disposal is not as environmentally harmful as first believed, although long-term effects remain unknown. Because the Environmental Protection Agency (EPA) is responsible for guidelines on dredged material disposal and criteria applicable to this research, it should begin full-time participation in the remainder of the Corp's research and any subsequent program. For those dredging projects where the EPA objects to the Corps' disposal practices, the Corps should include in its budget justifications: (1) the cost of changing from current practices; (2) a description of current and proposed disposal methods; (3) the reasons for suggested disposal method changes including expected environmental benefits; (4) the proposed changes' effect on the project's economic feasibility. (Greene-Florida)

HISTORY, POLITICS AND THE LAW OF THE CALIFORNIA TIDELANDS TRUST,
Western State Univ. Coll. of Law, Fullerton, CA.
C. E. Parker.
Western State University Law Review, Vol. 4, No. 2, p 149-97, Spring, 1977.

Descriptors: *California, *Coasts, *Land classification, *Tides, Tidal waters, Federal government, State governments, High water mark, Adverse possession, Legislation, Reclamation, Public land.

Tidelands are those lands affected by the ebb and flow of the tide. The dividing line between tidelands and uplands is determined by averaging high water marks. Land below the mean high water line is held by the state in the public trust. However, many thousands of acres of California's tidelands have been patented to private persons through their incorrect classification as swamp and overflowed lands, which are supposed to be above the mean high water line. A multitude of legal issues has arisen from this erroneous classification and sale of California's tidelands. In analyzing the status of the titles to certain lands along the California coastline, the roles of the California legislature, executive branch, and judiciary, state and federal constitutions, adverse possession, and the role of the federal government are discussed. A resolution to the unmarketability of these titles is proposed. Although California may be barred by its Constitution from enacting legislation to stabilize the marketability, the federal government could, under the Commerce Clause, enact legislation insuring present and future loans secured by tidelands, in the event of sovereign reclamation. (Horwich-Florida)

INDUSTRIAL SITING: ALLOCATING THE BURDEN OF POLLUTION,
W. G. Murray, Jr., and C. J. Seneker, II.
Hastings Law Journal, Vol. 30, No. 2, p 301-36, January, 1979.

Descriptors: *Industrial wastes, *Permits, *Construction, *Water pollution control, Federal water pollution control act, Permits, Administrative agencies, Alternative planning, Facilities, Comprehensive planning, Sites.

The diffusion among numerous federal and state agencies of environmental regulations for industrial siting creates three basic difficulties for industrial and conservation interests. First, there is no incentive or opportunity for comprehensive resource planning; second, existing agencies have limited jurisdiction and vested interests in protecting only one resource or serving limited constituencies; and lastly, the large number of permits required creates unacceptable time delays, uncertainty in development process and uncontrollable costs. Examples of federal regulation affecting industrial siting through their systems of permit and licensing requirements are the Clean Air Act, the National Environmental Policy Act, and the 1972 Federal Water Pollution Act Amendments (FWPCA). Under the FWPCA, permits are required from the state, EPA, and the Department of the Army. These federal requirements are in addition to state and local zoning and planning authority. The creation of a master siting agency, which would grant all permits necessary at the state level for a proposed site, would alleviate time delays and problems of competing resource demands. Enabling the agency to make a decision consistent with state development plans and siting legislation would be the Master Application.

THOUGHTS ON THE ROLE OF PENALTIES IN THE ENFORCEMENT OF THE CLEAN AIR AND CLEAN WATER ACTS,
Reed, Smith, Shaw and McClay, Pittsburgh, PA.
D. McN. Olds, J. C. Unkovic, and J. L. Lewin.
Duquesne Law Review, Vol. 17, No. 1, p 1-31, 1978-79.

Descriptors: *Regulations, *Penalties(Legal), *Law enforcement, *Water quality control, Federal water pollution control act, Clean air act, Legislation, Industrial wastes, Municipal wastes, Water policy, Permits, State governments.

The regulatory systems mandated by the federal Clean Air Act and the Federal Water Pollution Control Act are now firmly established. The federal Environmental Protection Agency (EPA) can now devote more attention to enforcement. This anticipated emphasis on enforcement raises certain legal and practical questions concerning the role of civil and criminal penalties. Sanctions under the Air and Water Acts, federal regulation before 1970, legal criteria governing imposition of civil and criminal penalties, and liability of corporations and their employees are discussed and analyzed. A comprehensive enforcement strategy is needed but difficulties in developing it are forseen. Among the anticipated problems are the prosecutorial discretion of agencies, confusion created by ambiguity in the Acts, and the fact that each state may have a different scheme of penalties. Although no single comprehensive enforcement policy statement has been issued, broad guidelines have been set forth in a series of speeches and memoranda from EPA enforcement personnel. For example, indications are that criminal sanctions will be used sparingly, with emphasis being placed on civil penalties. While the guidelines are still limited, they are a first step toward a comprehensive enforcement policy. (Horwich-Florida)

THE SOUTH CAROLINA COASTAL ZONE MANAGEMENT ACT OF 1977,
B. W. Wyche.
South Carolina Law Review, Vol. 29, No. 4, p 666-703, Sept. 1978.

Descriptors: *South Carolina, *Wetlands, *Legislation, *Shore protection, Tidelands, Permits, Beaches, Coasts, Accretion(Legal aspects), Erosion control, Regulation, Environmental control.

By 1972, every Atlantic Coast state except South Carolina had enacted legislation regarding what is perhaps the most critical resource of the coastal zone: the wetlands. That year, Congress also passed the federal Coastal Zone Management Act (CZMA) to encourage the states to extend this authority to all their coastal zones. South Carolina finally enacted its CZMA in 1977. Events leading up to this enactment are reviewed, and major provisions of the state law are discussed. Basically the Act establishes the South Carolina Coastal Council and requires it to develop and enforce a state CZM program and to exercise permitting control over various activities. One problem for this CZM plan is that it may be insufficient to meet the federal CZMA funding requirements. South Carolina's jurisdiction is limited by the Act to 'critical areas,' which means that activities within upland areas adjacent to coasts will not require permits, even if the activity directly and significantly affects coastal waters. The Act should be amended. Also discussed are the permit program, judicial review, accreted land, erosion control, the public trust doctrine, Corps of Engineers' role, and the taking doctrine. (Horwich-Florida)
W79-07246

GROUNDWATER POLLUTION IN SOUTH DAKOTA: A SURVEY OF FEDERAL AND STATE LAW,
C. L. Srstka.
South Dakota Law Review, Vol. 23, No. 3, p 698-734, Summer, 1978, 3 fig.

Descriptors: *South Dakota, *Groundwater, *Water pollution control, *Water quality control, Hydrology, Geology, Hydrogeology, Agricultural runoff, Legislation, Common law, Water pollution sources, Water resources.

Because national concern regarding water pollution has centered around surface water cleanup, the problem of groundwaters deterioration has been neglected for years. More attention must be given to groundwater. It is a major source of water supply, and groundwater pollution may pollute surface waters into which it is discharged. This comment discusses groundwater pollution problems in South Dakota and the adequacy of the law that has developed these to control those problems. Various sources of groundwater pollution are listed. Of particular concern to South Dakota are modern agricultural practices, such as intensive irrigation. The basic concepts of geology, hydrology, and hydrology of groundwater are explained, as are judicial and legislative treatments of groundwater. The law as it stands now is inadequate largely because of the failure of lawmakers to comprehend the physical facts and characteristics of groundwater. Relevant federal statutory and case law, South Dakota statutes, and common law remedies available to the individual are examined. Federal law has a negligible effect on groundwater pollution in South Dakota, and the ultimate burden of regulating groundwater pollution lies with the states. (Horwich-Florida)
W79-07247

AGRICULTURAL NON-POINT SOURCE WATER POLLUTION CONTROL UNDER SECTIONS 208 AND 303 OF THE CLEAN WATER ACT: HAS FORTY YEARS OF EXPERIENCE TAUGHT US ANYTHING,
L. L. Schloesser.
North Dakota Law Review, Vol. 54, No. 4, p 589-618, 1978. 1 tab.

Descriptors: *Pollution abatement, *Soil conservation, *Agriculture, *Comprehensive planning, Water pollution sources, Agricultural runoff, Regulation, Erosion, Sediments, Pesticides, Nitrogen, Water quality standards.

After several years of emphasis on point source pollution abatement under the federal Clean Water Act (CWA), gains in improving water quality by abatement of point source pollution alone will be offset by continuing non-point source pollution. Thus, a national shift to control non-point source pollution is underway. Agricultural non-point source pollutants are the principal contaminants. These pollutants include sediment, dissolved salts, nutrients, pesticides, organic matter, and pathogens. For the past four decades, the soil conservation program has been the voluntary adoption of the best land management practices (BMP's). This approach has been futile. A course of action which the federal Environmental Protection Agency (EPA) should take to set up an effective national regulatory program is recommended and set out. Initially, national standards must be impartially determined. Secondly, regulations must be impartially enforced. The EPA may withhold federal assistance for non-compliance. Thirdly, existing federal, state, and local institutions and agencies must be used for implementation and enforcements, particularly the Soil Conservation Service (SCS), Soil and Water Conservation Districts (SWCD's), and the EPA. Fourthly, a productive, viable agricultural economy must be maintained. And finally, the entire cost sharing program must be assessed and carefully formulated. (Horwich-Florida)
W79-07248

PUBLIC BEACHES: A REEVALUATION,
R. H. Zimmerman.
San Diego Law Review, Vol. 15, No. 5, p 1241-61, August, 1978.

Descriptors: *California, *Coasts, *Public access, *Beaches, Access routes, Recreation, Regulation, Zoning, Conservation, Judicial decisions, Land use, Public rights.

The California coastline is a distinct and valuable natural resource. In recent years, the shortage of public recreational beaches there has become critical. The public's right to the use of the water and the foreshore for public purposes is protected by California's Constitution, statutory provision, and the common law trust doctrine. The conflict between the public's need for recreational access to the coast and the private littoral-owner's right to preserve and to protect his property is herein examined. In particular, the California Coastal Act of 1976 is investigated, and its effectiveness in protecting and in enhancing the public's rights in coastline is assessed. Alternative methods of protecting the public's right to the coastline are examined. An examination of the judicial remedies of implied dedication and custom is also included. The existing mechanisms for protecting the public

coastal rights are inadequate. A solution to the problem will be forthcoming only when the legislature and the courts adopt a new attitude toward protection of this limited and valuable resource. (Fortin-Florida)

DIFFUSED SURFACE WATER LAW AS APPLIED IN SOUTH DAKOTA,
J. T. Sveen.
South Dakota Law Review, Vol. 23, No. 3, p 763-785, Summer, 1978.

Descriptors: *Surface waters, *South Dakota, *Water policy, *Damages, Water rights, Land use, Civil law, Common law, Reasonable use, Natural flow doctrine, Adjacent land owners, Adoption of practices.

Diffused surface water is all water that appears upon the ground in a diffused state with no permanent source of supply or regular course of flow and disappears by perculation or evaporation. Diffused surface water usually results from rain or melting snow. Almost any change of use of one's land will alter surface flows and probably result in harm to another's use and enjoyment of nearby land. Three rules pertaining to diffused surface water have developed in the United States: the common enemy rule; the civil law or natural flow rule; and the modern trend toward the reasonable use rule. South Dakota presently distinguishes urban land from rural land in its treatment of diffused surface waters. A modified civil law rule is followed for agricultural lands. The reasonable use doctrine is applied to urban areas. The present discrepancy in the law should be resolved to allow simple and just solution to surface water controversies. The South Dakota Supreme Court should take that final step and apply a common standard to all state drainage problems. (Fortin-Florida)

THE ARIZONA WATER RESOURCES COMMITTEE: AN HISTORICAL PERSPECTIVE,
Arizona Univ., Tucson. School of Renewable Natural Resources; Wisconsin Univ-Madison. Dept. of Landscape Architecture.
H. J. Cortner, and M. P. Berry.
In: Proceedings, 21st Annual Arizona Watershed Symposium, Nov. 1, 1977, Tucson, Arizona, Arizona Water Commission Report No. 10, p 5-15, (1977), 6 tab, 11 ref. OWRT A-072-ARIZ (2).

Descriptors: *Administrative agencies, *Institutional constraints, *Watershed management, *Water policy, *Water resources development, Vegetation effects, Political aspects, Governmental interrelations, Local governments, State governments, Political constraints, Legal aspects, Interest groups, Alternate planning, Watersheds(Basins), Arizona.

The history, development, organizational resources, public relations and policy objectives of the Arizona Water Resources Committee (AWRC) are analyzed here with speculation as to the committee's future roles and effectiveness. With its main objectives based upon the 1956 Barr report and conclusion that vegetative modification can be one of the most promising methods for increasing water supplies in Arizona, the AWCR has become an important political interest group with a significant impact upon Arizona water policy since its inception in 1957. This analysis of the committee's action, research and public relations programs reveals both positive and negative results, and a great deal of controversy over organization, orientation and representation. As an organized group the committee can be characterized by many of the variables that distinguish groups with potential to gain access to exert influence in governmental decision making. It is concluded that while the AWRC's remarkable successes in many of its research objectives, especially with its Beaver Creek experimental watershed, are indications of its political proficiency, it must be able and willing to make adjustments in its strategies and tactics for achieving its goals and objectives as the political environment continues to change. (Tickes-Arizona)

A PROPOSED WATER RESOURCES CODE OR STATUTE: ARIZONA WATER RESOURCES MANAGEMENT ACT OF 1977,
Arizona Univ., Tuscon. Coll. of Law.
R. E. Clark.
Arizona Law Review, Vol. 19, No. 4, p 719-859, 1977.

Descriptors: *Arizona, *Legislation, *Groundwater resources, *Water management(Applied), Groundwater, Planning, Water supply, State governments, Percolating water, Legal aspects, Natural resources, Conservation.

In Arizona, current uses and projected demands far exceed available water supply. The need is recognized for legislation which will improve water management and allocation and encourage optimal uses and conservation of the limited water supply. Current legislation relates to only 40% of the State's total water supply. The remaining 60% pumped from groundwater sources is not covered by legislation. The 1977 Arizona Water Management Act (AWMA) recognizes that previous and existing laws have given inadequate attention to the development and use of groundwaters either as an independent source or in conjunction with surface waters. The AWMA as proposed is divided into four chapters: (1) Administration and Operation; (2) Permits and Regulation of Uses; (3) Adjudication of Water Rights; and (4) Wells. The draft proposal began in 1975 in a Natural Resources Law seminar. The goal agreed upon in 1975 remained the same: a broad statute that concentrates on past experience and present problems of scarcity and the uneven occurrence and allocation of water. The proposed statute is followed by a lengthy bibliography and a suggested list of statutes that should be repealed. (Ewing-Florida)

A GEOGRAPHICAL ANALYSIS OF TRENDS IN UNITED STATES WATER RIGHTS LAWS (WITH EMPHASIS ON THE SOUTHEASTERN STATES),
Michigan Univ., Ann Arbor. Dept. of Geography.
J. J. May.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A052 684, Price codes: A08 in paper copy, A01 in microfiche. Masters Thesis, 1977, 171 p, 18 fig, 2 tab.

Descriptors: *Water rights, *Southeast U.S., *Demand, *Environmental effects, Water supply, Legal aspects, Appropriation, Riparian rights, Permits, Judicial decisions, Surface water availability, Regulation.

The southeastern United States has always had abundant water resources, partly because of the relative lack of demand. Today much of this has changed. The South and West combined now have larger populations than the north. The appropriation doctrine has become an integral part of western life. Southern states have analyzed the applicability of the appropriation doctrine to their needs. Only Mississippi has adopted the doctrine. Several other states have adopted a newer system known as the permit system. This system incorporates many appropriation principles, yet is flexible enough to adapt to each state's unique requirements. Southern states have no techniques, laws or procedures which would enable them to regulate riparian water rights. The problem is what will happen to the water laws as more people move south. Precise evaluation of southern water uses and priorities must be researched and reviewed so that the proper changes may be made and growth may continue. An eight page reference is included. (Ewing-Florida)

STRENGTHENING STATE WETLAND REGULATIONS,
Environmental Law Inst., Washington, DC.
J. A. Kusler.
For Sale by the Supt. of Doc., U.S. Government Printing Office, Washington, D.C. 20402, as Stock Number 024-010-00506-8, Report FWS/OBS-78/98, Nov., 1978. 132 p.

Descriptors: *Wetlands, *State governments, *Protection, *Regulation, Legal aspects, Local governments, Ecology, Preservation, Administrative decisions, Standards, Governmental interrelations.

Recognition of the ecological and economic importance of wetlands, combined with accelerated flood losses and water pollution from wetland development, has prompted many states to adopt regulatory programs specifically designed to control coastal or inland wetland use. Other states guide wetland uses as part of broader flood plain, coastal area, scenic and wild river, shoreland, and critical area programs. Additional considerations prompt state programs: (1) wetlands often cross local government jurisdictions, creating problems in local definition and management; (2) wetland water supply is affected by watershed use; watersheds often encompass several jurisdictions; (3) local government often lacks expertise and funds; and (4) control and protection of wetlands is closely linked with traditional State roles of wildlife protection and public rights in navigable waters. State and conjunctive state and local wetland protection efforts are examined. Two versions of a draft statute provide a basis for new wetland protection efforts. Despite the promising start for state programs, most have been only partially implemented. Much remains to be done to protect essential wetland values and prevent losses from floods and other hazards. (Ewing-Florida)

PROTECTING INSTREAM FLOWS UNDER WESTERN WATER LAW - SELECTED PAPERS,
Office of Biological Services, Fort Collins, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 993, Price codes: A04 in paper copy, A01 in microfiche. Instream Flow Information Paper No. 2, September, 1977, 58 p.

Descriptors: *Water law, Watercourses(Legal aspects), *Stream flow, Water resources, Water rights, Legal aspects, Public benefits, Equity, Appropriation.

These papers cover three subjects: (1) opportunities under current western water law for protecting instream flows; (2) the utility of equity law principles for protecting instream flows; (3) the future of western water law for protecting instream flows. There is an appendix which presents a matrix of all strategies for protecting instream flows. This summary of stategies includes direct legislative actions, administrative or agency actions, contractual agreements, planning programs, judicial doctrines and procedures and other strategies and techniques. Article one is composed of a broad overview of those aspects of the appropriation doctrine significant to instream flows preservation, and the problems and possibilities under the doctrine. Article two discusses the impact of equity law in the doctrine, and the possibility of accomodating private rights under the doctrine and the public interest in beneficial use of public resources. Article three explores the future development of the doctrine both in the courts and through governmental regulation and management. Judicial change will be on a case-by-case basis with no comprehensive change. Legislative change entails the problem of paying for the change. (Greene-Florida).
W79-07260

PUBLIC ACCESS TO THE OCEANFRONT BEACHES - A REPORT TO THE GOVERNOR AND LEGISLATURE OF NEW JERSEY (PUBLIC ACCESS TO THE NEW JERSEY OCEANFRONT BEACHES),
New Jersey Beach Access Study Commission, Trenton.
Available from the National Technical Information

Service, Springfield, VA 22161 as PB-274 099, Price codes: A03 in paper copy, A01 in microfiche. Report April, 1977, 12 p, 2 fig, 10 append.

Descriptors: *New Jersey, *Beaches, *Public access, *Seashores, Public lands, Public rights, Legal aspects, Legislation, State governments, Environmental effects, Recreation facilities.

New Jersey's beaches are among the most heavily used in the nation. The Beach Access Study Commission (BASC) studied the feasibility and advisability of providing open access to the state's beaches bordering on the Atlantic Ocean. 'Beaches' include both the dry sand and wet sand areas. Wet sand area is known as Public Trust Land and belongs to the State unless conveyed by a riparian grant. All but a handful of the state's oceanfront municipalities now charge fees for use of public beaches. Continued land development along the oceanfront threatens to block physical and visual access to open beaches. The Public Trust lands along the coast should be readily accessible to all New Jersey citizens. The best way to achieve greater equity in beach access is through local initiative, subject to state overview, rather than by direct state regulation. The BASC's recommendations fall into three broad implementation categories: State legislation, federal actions, and other state administrative actions. Enactment of a comprehensive beach management law and implementation of the other recommendations will assure citizens a meaningful opportunity to enjoy the beaches. (Ewing-Florida)

UNNECESSARY AND HARMFUL LEVELS OF DOMESTIC SEWAGE CHLORINATION SHOULD BE STOPPED,
General Accounting Office, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 288, Price codes: A04 in paper copy, A01 in microfiche. Report to the Congress August 30, 1977, 36 p.

Descriptors: *Chlorination, *Sewage bacteria, *Waste water treatment, *Water quality standards, Waste treatment, Fish toxins, Swimming, Municipal wastes, Disinfection, Environmental effects, Water quality.

Chlorine discharges by municipal sewage treatment plants sometimes exceed levels safe for the aquatic environment. Except the chlorine needed to protect areas of shellfish harvesting, or of unrestricted irrigation with sewage, the public health benefits are minimal from widespread use of sewage chlorination. The federal General Accounting Ofice (GAO) recommends the Environmental Protection Agency: (1) revise its water quality criteria regarding the bacterial standard for swimmable waters, recognize seasonal variations and delineate those circumstances where sewage chlorination is needed to protect public health; (2) include chlorine residual limitations in all National Pollutant Discharge Elimination System Permits for sewage treatment plants and all industrial discharges of chlorinated effluents; (3) lower chlorine residual limitations in powerplant effluents; (4) require regional offices or states to tailor permits to assure the use of chlorine testing and operating equipment which would improve chlorination efficiency; and (5) incorporate rapid, thorough initial mixing and flow-proportional dosage adjustment into new plant construction review criteria. The GAO also recommends that Congress amend the 1972 Federal Water Pollution Control Act Amendments to permit exceptions from the national goal for swimmable waters to recognize those situations where waters are unswimmable for other reasons. (Greene-Florida)
W79-07262

ILLINOIS ENVIRONMENTAL LAW - STATE PRE-EMPTION OF LOCAL GOVERNMENTAL REGULATION OF POLLUTION RELATED ACTIVITIES,
W. L. Niro.
Illinois Bar Journal, Vol. 67, No. 2, p 118-26, October, 1978.

Descriptors: *Illinois, *Local governments, *State governments, *Governmental interrelations, Regulation, Federal government, Pollution abatement, Environment, Governments, Pollutants, Political aspects.

Land, air, water and noise pollution are typical urban environmental problems which have a detrimental impact on a local, regional or interstate scale. Pollution most often transcends political boundaries creating environmental problems over a broad geographical area. Local governments are increasing their sphere of environmental regulation through zoning power or under a broad constitutional grant of home rule power. Conflicts arise between local governments seeking to promote local welfare and state governments seeking to control pollution on a much broader scale. The courts may rule in one of three ways: (1) state preemption of local authority in favor of exclusive state regulation; (2) concurrent state and local authority; or (3) exclusive local authority. Concurrent jurisdiction, when appropriate, could achieve a clean, healthful environment and promote greater local involvement in reducing the particularly acute environmental damage to local areas. This cooperative government scheme is the core of the federal pollution control effort, which effectuates greater involvement at all levels of government. Included is an analysis of several cases dealing with these issues. (Fortin-Florida)

HOW TO COPE WITH THE SAFE DRINKING ACT,
Texas Univ. at Austin. Lyndon B. Johnson School of Public Affairs.
D. J. Eaton, G. A. Rohlick, and B. Lovelace.
Water & Wastes Engineering, Vol. 15, No. 7, p 31-34, 36, 38, July, 1978. 4 tab.

Descriptors: *Potable water, *Federal government, *Water pollution control, *Water purification, Legislation, Administrative agencies, Water pollution treatment, Public health, Water quality, Water quality standards, Water treatment.

The federal Safe Drinking Water Act involves four types of implementation problems. Not only are the roles of different agencies and the rules they must follow uncertain, but one Act may impose harsh consequences on small water suppliers not in compliance with the Act. The meaning of safety and the cost/benefit balance complicate regulation of drinking water contaminants; and finally, the Act does not mention small water suppliers not under its jurisdiction. Federal agency mandates appear to overlap, and consumer reaction is uncertain. Since the ultimate responsibility for improving drinking water rests on local water utilities and their customers, implementation procedures should respond to their needs and concerns. Some small, privately owned water systems, such as those for trailer parks, are included in the Act's coverage and compliance may drive them into bankruptcy. Some water utility managers question whether flourides or nitrates are hazardous, and feel that their removal should not be the sole responsibility of local suppliers. There is disagreement as to whether costs of activated charcoal treatment are balanced by possible reductions in human cancers. (Rule-Florida)
W79-07264

STATE PROGRAM ELEMENTS NECESSARY FOR PARTICIPATION IN THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM,
Environmental Protection Agency, Washington, DC.
Federal Register Vol. 43, No. 100, p 22160-68, May 23, 1978.

Descriptors: *Permits, *Waste disposal, *Federal water pollution control act, *Sewage effluents, Administrative agencies, Administrative decisions, Water pollution, State government, Pollution abatement, Standards, Regulation, Federal government.

This rule revises parts 124 and 125 of federal Environmental Protection Agency (EPA) regulations, and clarifies procedures and criteria the EPA will use to veto issuance of state national pollutant discharge elimination system (NPDES) permits. These changes are necessary to assure national consistency in water pollution control efforts. Any permit issued to a discharger shall apply and assure compliance with effluent standards and limitations of the Clean Water Act (CWA). Any State or interstate agency participating in the NPDES shall transmit copies of proposed permits to the Regional Administrator (RA). The RA may object to the issuance of the permit as being outside the CWA guidelines and requirements upon one or more of seven grounds. The RA shall notify the Director of any objection to the issuance of the permit. Within 90 days of the Director's receipt of the objection, the State, interstate agency or any interested person may request that a public hearing be held on the objection. After the hearing, the RA shall notify the State of its decision to: (1) reaffirm; (2) modify; or (3) withdraw the objection. (Ewing-Florida)

IMPLEMENTATION OF EXECUTIVE ORDER 11988 ON FLOODPLAIN MANAGEMENT,
Corps of Engineers, Washington, DC.
Federal Register, Vol. 43, No. 101, p 22306-08, May 24, 1978.

Descriptors: *Floodplains, *Regulation, *Administrative agencies, Environmental effects, Federal government, Legislation, Flood control, Conservation, Preservation, Project planning, Legal aspects.

This proposed regulation prescribes policies to be used by the Corps of Engineers in implementing Executive Order 11988 (EO). The objectives of the EO are to avoid the long and short term adverse impacts associated with floodplain occupation and modification and to avoid direct and indirect support of flooplain development wherever a practicable alternative exists. Implementation of the EO necessitates: (1) determining if proposed action is in the base floodplain; (2) determining if there is a practicable alternative to locating the action in the base floodplain; (3) identifying adverse impacts of the action and induced development and identifying losses of natural and beneficial values of the floodplain; (4) determining any practicable alternatives if the action induces development in the base floodplain; (5) determining viable methods to minimize adverse impacts; (6) advising the public if the action will be in the floodplain; (7) recommending the most desirable plan. A finding that an action must be located in a floodplain must be reported. The public is to be involved in floodplain management decisions. Emergency and flood related activities are exempt from the EO. (Ewing-Florida)

THE CLEAN WATER ACT OF 1977 - MODIFICATIONS OF THE MUNICIPAL PROGRAM,
K. M. Hunciker.
The Harvard Environmental Law Review, Vol. 2, p 127-75, 1977.

Descriptors: *Federal water pollution control act, *Water pollution control, *Water purification, *Waste treatment, Federal government, Legislation, Water pollution, Municipal wastes, Technology, Waste water(Pollution), Legal aspects, Administrative decisions.

The 1977 Clean Water Act (CWA) makes a series of corrections to the municipal wastewater treatment program established under the 1972 Federal Water Pollution Control Act Amendments. The 1972 amendments required all municipal point sources to achieve 'secondary treatment' by July 1, 1977 and 'Best Practicable Waste Treatment Technology' (BPWTT) by July 1, 1983. Because of inadequate funding and delays, only 1/3 of the nation's municipalities met the secondary treatment deadline. The CWA extends this deadline to 1983; however, given the unrealistically low levels of funding passed in the CWA, the 1983 deadline will almost certainly not be met. Most likely the 1983

Congress will again be faced with deadline extensions and costly funding needs. The CWA significantly strengthens the role of unconventional technology in the control of municipal water pollution. Increased incentives and requirements for the application of reuse and unconventional technology will have a major impact on municipal programs. The alternative and innovative technology efforts are more successful than the deadline and funding modifications. The benefits obtainable from unconventional technologies warrant passage of the CWA. (Ewing-Florida)
W79-07268

NON-POINT POLLUTION AND ALASKA,
J. T. Tate, Jr.
UCLA - Alaska Law Review, Vol. 7, No. 1, p 169-84, Fall, 1977.

Descriptors: *Water pollution sources, *Water pollution control, *Environmental effects, *Alaska, Pollutant identification, Water pollution effects, Legislation, State governments, State jurisdiction, Federal water pollution control act, Waste water(Pollution).

Non-point source (NPS) pollutants may account for as much as 50 percent of national water quality problems. Originally known as background pollution, there is no statutory definition of NPS pollution due to its diverse origin. The Alaska Department of Environmental Conservation has identified four areas requiring regulation: (1) silviculture; (2) transportation corridors; (3) mining; and (4) urban environment. Construction practices in Alaska must be carefully managed because of the fragile permafrost and virtual impossibility of re-vegetation of areas strippped of tundra cover. Alaska's recent Environmental Conservation Act covers NPS pollution, but fails to give it the attention accorded to point source pollution. Alaska is currently identifying and evaluation NPS pollution in connection with 1972 amendments to the Federal Water Pollution Control Act, which so far has failed to accomplish its purposes. The Environmental Protection Agency attitude has been negative, in contrast to Alaska's commitment to clean waters. If federal funding is withdrawn, Alaska may be forced to take full financial responsibility for its NPS pollution control efforts. (Rule-Florida)

INLAND BOUNDARY DETERMINATIONS FOR COASTAL MANAGEMENT PURPOSES - AN ECOLOGICAL SYSTEMS APPROACH TO REQUIREMENTS OF THE FEDERAL COASTAL ZONE MANAGEMENT ACT OF 1972,
Texas Univ. at Austin.
C. M. Woodruff, Jr., W. L. Longley, and A. E. Reed.
Coastal Zone Management Journal, Vol. 4, No. 1/2, p 189-211, 1978. 5 fig, 1 tab.

Descriptors: *Comprehensive planning, *Coastal plains, *Systems analysis, *Water management(Applied), Coasts, Shores, Texas, Decision making, Analysis, Adoption of practices, Non-structural alternatives.

The 1972 federal Coastal Zone Management Act is aimed at coastal zones, including coastal waters and adjacent shorelines, strongly influenced by each other. The zone also extends inland to the extent necessary to control shorelands. Vagueness in the law causes difficulties for coastal states that must delineate coastal zones, and creates a larger problem of consistency among the states. An inland coastal zone boundary may be defined using operational ecological systems, which demonstrates interconnections among various coastal ecological systems. The application of this kind of systems analysis could prevent an arbitrarily established boundary. The federal law defines coastal waters explicitly, but the shorelands definition must be inferred from Section 304-a. However, a biophysical procedure used in the Texas coastal region entails an analysis and delineation of distinctly coastal environment as stated in the law, followed by establishment of the inland coastal zone boundary in a two-step scientific inquiry. First the ecosystems comprising coastal waters and adjacent areas are mapped, then sustaining flows among the systems are charted. Thus the boundary reflects a conceptual mode but is also based on measurable land and water conditions. (Rule-Florida).

THE PUBLIC TRUST DOCTRINE IN NORTH DAKOTA,
D. Negaard.
North Dakota Law Review, Vol. 54, No. 4, p 565-88, 1978.

Descriptors: *Water law, *North Dakota, *Public rights, Common law, Judicial decisions, Water resources, Water rights, Water policy, Public lands, Planning.

A common law concept, the Public Trust Doctrine allows the public, as beneficiates, to protect its interests when the state exceeds restrictions imposed upon it by a property trusteeship dedicated to the public. Public interests are protected by providing the general public access to the courts when a concerned citizen feels the state has exceeded its authority by an improper allocation of a trust resource. Water demand for energy development and domestic usage created by population impacts associated with energy development and domestic usage created by population impacts associated with energy development will undoubtedly cause litigation involving the trust doctrine. Public interest is served when a governmental body, required to represent the public, ignores or reacts arbitrarily regarding the trusteeship terms in which the public has vested property rights. The doctrine can and will provide a minimum standard for review of government action, but is no substitute for careful, detailed planning and manadatory legislative guidelines for wise energy-related development. (Fortin-Florida)

SUPREME COURT REJECTS WATER AS A LOCATABLE MINERAL FOR FEDERAL MINING CLAIMS,
L. Peters.
Natural Resources Journal, Vol. 19, No. 1, p 183-85, January, 1979.

Descriptors: *Mining, *Water rights, *Judicial decisions, Prior appropriation, Federal jurisdiction, Federal-state water rights conflicts, Water resource development, Water law, Water resources, Water use, Water values, Conflicts.

Historically, the western United States has relied on the doctrine of prior appropriation to allocate scarce water resources. Andrus v. Charlestone involved the determination of whether water is a locatable and claimable mineral under federal mining law. The Court unanimously rejected this theory, preventing what would have been a radical departure from traditional western water acquisition rights. Under federal mining law, a citizen can file a claim, possibly obtain a patent, and acquire fee simple title to certain federal lands to extract valuable minerals. The Justices agreed that water was a valuable mineral, but held that water by itself could not support a mining claim. Two overlapping systems for acquiring water rights would create a myriad of problems among water users. If water were recognized as a locatable mineral, a claimant, consistent with federal mining claims rights, could ignore previous water users and deplete all the water from the claim. The decision is a special victory for western states in their fight against federal encroachment upon their natural resources. (Fortin-Florida)

WATER USE REGULATION IN COLORADO: THE CONSTITUTIONAL LIMITATIONS,
H. Gottschalk.
Colorado University Law Review, Vol. 49, p 493-512, Summer, 1978.

Descriptors: *Colorado, *Constitutional law, *Regulation, *Water rights, Prior appropriation, Invasion, Water utilization, Public benefits, Constitutional law, Legislation, Municipal water.

In Colorado, state regulation of private water use has traditionally been limited to waste prevention. However, political and legal pressure is prodding the state to increase control of private water use. Several bills have recently been proposed to regulate water use. One such bill provides that any change of a water right from an agricultural to another type of use would result in the loss of the right's original priority date. Another bill requires that any transmountain diversions of water must be approved in a state-wide election. Both bills would restrict the free alienability of water rights, decreasing their value, and, prevent any increase in municipal water supplies, thus curtailing the availability of housing to all those desiring to live in Colorado. These limitations will thus likely be challenged on three constitutional grounds: (1) they constitute a taking of private property; (2) they are not enacted for the benefit of the public welfare; (3) they violate the right to travel. In analyzing the constitutional limitations of these regulations, case law, policy, and other constitutional issues are examined. It is concluded that the proponents of the regulations will have great difficulty in sustaining their validity. (Horwich-Florida)

AN ALTERNATIVE PERSPECTIVE ON COMMON PROPERTY RESOURCE ALLOCATION DECISIONS IN THE COASTAL ZONE,
Texas A and M Univ., College Station.
G. C. Swanson, J. L. Seymour, and R. B. Ditton.
Coastal Zone Management Journal, Vol. 4, No. 1/2, p 25-43, 1978. 1 fig, 1 tab.

Descriptors: *Shore protection, *Water management(Applied), *Comprehensive planning, *Wetlands, Shore, Coastal marshes, Seashores, Tidal marshes, Beaches, Economics, Coasts.

Failure to allocate coastal resources, as well as their improper utilization stems from the fact that no adequate basis currently exists to define the correct relationship and division of labor between public and private sectors. Thus, instead of considering consumer utility as the criterion of effectiveness of an agency, performance is assessed on the basis of producer efficiency. Historically, this results from a lack of conceptual clarity regarding differences between public and private goods and services, causing resource allocation decisions to be assigned to the public or private sector without regard to that sector's strengths or weaknesses in dealing with the allocation decision. Coastal property involves both public and private interests. Beaches and shorelands protection could be based on property interests rather than regulation. Artificial reefs, usually constructed by state fish and wildlife departments and local municipalities, could be financed by private enterpreneurs if they could have a property right in the resultant fishing areas. Coastal wetlands and marshlands, a great percentage of which are privately owned, could be treated as subject to a public servitude, with compensation to owners for the public's indirect use. (Rule-Florida)

THE FEDERAL REGULATORY ROLE IN COASTAL LAND MANAGEMENT,
Bates Coll. of Law, Houston, TX.
G. L. Finnell, Jr.
American Bar Foundation Research Journal, Vol. 1978, No. 2, p 169-288, Spring, 1978.

Descriptors: *Federal-state water rights conflict, *Federal jurisdiction, *Coasts, Conservation, Federal government, State governments, Environmental control, Marshes, Federal water pollution control act, Rivers and harbors act, Clean air act.

Historically, the federal government has had a major role in regulation of coastal activities, primarily restricted until recently, to regulation of

activities affecting navigable waters. On the sea coast, regulation of landward areas of such jurisdictional boundaries as mean high tide line was generally left to the states or their delegates. Recently, the federal role, both direct and indirect has increased dramatically. If states fail to respond adequately to important regulatory needs, our federal constitution permits expansion of federal power to fill the void. For coastal land management, the most important source of federal jurisdiction is the power to regulate commerce...among the states. The most important source of state jurisdiction is the police power. Coastal regulatory programs should consider all competing values. Analysis should address at least the following categories: (1) the relationships of environmental, economic and social values; (2) the relationship of the individual property owner to government; (3) intergovernmental relationships; (4) the relationship and functioning of the political and legal processes; and (5) practical considerations. (Fortin-Florida)

PRESIDENT CARTER ANNOUNCES WATER POLICY INITIATIVES,
F. J. MacDowell.
Natural Resources Journal, Vol. 19, No. 1, p 191-96, January, 1979.

Descriptors: *Water policy, *Water resources, *Administrative decisions, Water supply, Water structure, Water conservation, Administration, Administrative costs, Political aspects, Environmental effects, Conservation.

President Carter has set out several major objectives in his 1978 Water Policy Initiatives: (1) making water projects more economically sound; (2) stressing water conservation: (3) improving federal-state cooperation; and (4) focusing more attention on environmental quality. Set forth are his criteria for selection of projects that he would approve. The criteria are designed to relate policy objectives to the budget process, and to inform Congress and the public of what his selection process entails. Federal agencies involved with water resources are obviously affected by Carter's policy and its ramifications. Concern exists because individual states, especially western states, like to exercise exclusive control over their water. Probably all of the objectives can be furthered in some ways. The policy contains necessary improvements in the water resources area. Some of the directives are general and leave much discretion in individual agencies. The risk exists that agencies will implement only the minimum requirements and leave unsolved the most important problems. This might be especially true in the western states, where Carter's opposition to water projects has aroused hostility. (Fortin-Florida)

COASTAL LAND MANAGEMENT: AN INTRODUCTION,
Bates Coll. of Law, Houston, TX.
G. L. Finnell, Jr.
American Bar Foundation Research Journal, Vol. 1978, No. 2, p 153-67, Spring, 1978.

Descriptors: *Coasts, *Land management, *Governmental interrelations, *Planning, Federal government, State governments, Water rights, Beaches, Local governments, Long term planning, Zoning.

During the 1970's, the coastal zone-that ecologically unique area where sea and land meet and strongly influence each other - has become a principle laboratory for experiments in new land management techniques. Disputes over coastal land use raise important questions as to the interaction between the individual and government, and the interrelationships among local, state and national governments. Although the federal government has always had a major role in regulation of coastal activities, until recently, this role was restricted mainly to regulation of activities affecting navigable waters. Today, the trend in coastal land management is not toward federal preemption of state and local authority, but toward 'cooperative federalism'. State legislatures must take the lead in designing coastal land management programs. A state's coastal land planning process should be coordinated, to the maximum degree feasible, with other state programs for transportation, energy, and water resource planning. State and local governments that resist the enactment and implementation of concurrent and cooperative regulatory programs are probably doing their citizens a serious disservice. (Fortin-Florida)

PORT STATE JURISDICTION OVER VESSEL - SOURCE MARINE POLLUTION,
Coast Guard, Washington, DC. Office of the Chief Counsel.
R. A. Legatski.
Harvard Environmental Law Review, Vol. 2, p 448-73, 1978.

Descriptors: *Port authorities, *International law, *Political constraints, *Water pollution control, Ships, State jurisdiction, Legal aspects, Standards, Economic impact, Water rights.

Port state jurisdiction over vessel-source marine pollution may provide a reasonable balance between the need to protect the ocean environment and the sometime conflicting need to avoid imposing excessive costs on ocean-going commerce. As formulated in the Informal Composite Negotiating Text (ICNT) from the Law of the Sea Conference, port states would have no special competence to prescribe vessel-source pollution control standards. They would play a significant role in the enforcement of standards prescribed by flag and coastal states and international agreements. Several conditions are necessary to the development of a port state regime that both controls vessel-source pollution and restricts unilateral coastal state jurisdictional assertions: (1) broadly accepted uniform international standards; (2) adequate standards to protect the coastal state's environmental interests, like the 'special area' standards of the ICNT; and (3) assurances to coastal states that other states will actively protect against ocean pollution. Possible impediments to the development of international standards are the proposed Tanker and Vessel Safety and Clean Water Acts. The United States should not interpret these acts to authorize implementation of standards significantly not variance with those accepted by other states. (Greene-Florida)

INSUFFICIENT EIS HALTS HYDRO-ELECTRIC PROJECT,
A. T. Lorenz.
Natural Resources Journal, Vol. 18, No. 2, p 403-07, April, 1978.

Descriptors: *Hydroelectric plants, *Power plants, *New Mexico, *Environmental effects, *Dams, Federal government, Judicial decisions, Engineering structures, Fish conservation, Wildlife conservation, Project planning.

In 1973 the federal Bureau of Reclamation began construction on a 23-megawatt powerplant in the Navajo Dam and Reservoir on the San Juan River in New Mexico. As originally authorized by Congress in 1956, the powerplant was to produce 15-megawatts of electricity for use in a gravity-flow irrigation system. Instead, the plant was designed for an all-sprinkler system. In 1976, the National Wildlife Federation and the New Mexico Wildlife Federation brought action to halt construction because the resultant fluctuations in water volume and flow rate would harm fish and wildlife. The District of Columbia District Court found that since the powerplant was not proposed until 1973, it could not have been implicitly authorized earlier, and that defendant's failure to prepare a detailed environmental impact statement prevented compliance with the National Environmental Policy Act of 1969. This failure, and the Secretary of the Interior's failure to report to Congress concerning the stream modification, violated the Fish and Wildlife Coordination Act. Thus, the power that would have been created by a non-polluting renewable source must be replaced using fossil fuels. (Rule-Florida)

CONSERVATION AND DEVELOPMENT IN OREGON'S COASTAL ZONE,
A. Levinson, and J. Hess.
Coastal Zone Management Journal, Vol. 4, No. 1/2, p 97-114, 1978. 1 fig, 2 tab.

Descriptors: *Coasts, *Shore protection, *Comprehensive planning, *Oregon, Shores, Decision making, Water management(Applied), Planning, Management, Permits, Land use, Land management.

Coastal zone management in Oregon, based on the state's general land-use law, covers a coast of 352 miles, or 7811 square miles of land. The shoreline was designated as a public highway in 1913. Later, the state's 1969 Beach Bill declared public easement rights to the ocean shore up to the vegetation line. In 1971, bills were passed requiring a permit prior to filling any of Oregon's waters, and controlling silting and debris in streams and estuaries. Also in 1971, the Oregon Coastal Conservation and Development Commission was established in an attempt to coordinate the coastal management program. Later the Commission was absorbed into the Land Conservation and Development Commission (LCDC) which developed final goals and guidelines for compliance with the federal Coastal Zone Management Act. Other state laws and agencies continue to have an impact in planning for coastal zone land and water use. The goals developed by the LCDC were refined and adopted by the state legislature in 1976, and now constitute the key to Oregon's coastal zone management program, which is now undergoing federal review. HIGHTIDE - A COASTAL COMMISSIONER'S PERSPECTIVE: CHOOSING BETWEEN WHAT THE LAW SAYS AND WHAT THE LAW ALLOWS,
J. B. Rosener.
Coastal Zone Management Journal, Vol. 4, No. 1-2, p 1-5, 1978.

Descriptors: *Decision-making, *Political aspects, *Coasts, *Land development, Land use, Local governments, Permits, Construction, Administrative agencies, Planning, Environmental effects.

Observations are presented of the role of a coastal commissioner. It is suggested that the role carries with it both implementation and policymaking functions which require the exercise of discretionary authority. The main task of regional commissions was to control coastal development. People who wished to develop within the permit zone were required to obtain permits from a regional commission before they could build. Public hearings were held on every permit application. The commission had veto power over the local government and the law was vague as to how criteria for the denial of development permit applications should be applied. The Commission deliberations were open, visible and unlike other regulatory bodies' meetings. Commissions were under constant scrutiny by citizens and legislators. It was discovered that what was adverse, what was environmental, and what constituted an impact, called for discretionary judgements. It was found that certain kinds of skills were needed in order to resolve the conflicts between public and private interests. The tug of war between what the law said and what the law allowed provided the framework within which commissioners functioned, which was that of both 'implementer' and 'policy maker.' PUBLIC ACCESS TO THE SHORELINE: THE RHODE ISLAND EXAMPLE,
Rhode Island Univ., Kingston.
D. Nixon.
Coastal Zone Management Journal, Vol. 4, No. 1/2, p 65-79, 1978.

Descriptors: *Rhode Island, *Shores, *Public access, *Public rights, Common law, Coasts, Easements, Right-of-way, Federal government, Legal aspects, Long term planning, Public rights.

The issue of public access to the Rhode Island shoreline is considered at three levels: (1) common law doctrines of the public trust, dedication, easement by prescription, and custom; (2) federal impact through the 1972 Coastal Zone Management Act (CZMA); and (3) state management programs. The Rhode Island example presents a variety of potential alternatives to pursue to increase public access. The common law remedies, though complex and manageable only on a case-by-case basis, may be used by a member of the public to protect access rights. The federal government, through the CZMA, regards the access issue as one of many uses that must be permitted and encouraged along the shoreline. Program management and acquisition funds are reserved for states that plan according to federal guidelines. Examination of state programs has demonstrated the problems in discovering and maintaining individual rights-of-way and in developing management programs to ensure continued success. The diversity of levels by which to approach the access problem under this example can only help provide a steady increase in access to the Rhode Island shoreline. (Ewing-Florida)

6F. Nonstructural Alternatives

MEASURING PREFERENCES FOR NATURAL LANDSCAPES,
Kentucky Univ., Lexington. Dept. of Civil Engineering.
J. A. Dearinger.
Journal of the Urban Planning and Development Division, Proceedings of the American Society of Civil Engineers, Vol. 105, No. UP1, p 63-80, January 1979. 5 fig, 6 tab, 31 ref. OWRT B-015-KY(3). 14-31-0001-3086.

Descriptors: Natural resources, *Recreational facilities, Streams, Attitudes, *Esthetics, Human behavior, Land use, Urban development, Zoning, Preferences, Multivariate data, Factor analysis, Regression analysis.

In land-use planning, decisions must often be made concerning the preservation or development of natural landscapes. The research described herein sought a way to measure these preferences. Subsets of 95 photographic color slides portraying varying degrees of naturalness were shown to 14 assorted groups of people (371 persons in all). Preferences were quantified using a semantic differential scale made up of 20 bi-polar adjective pairs. The results were factor analyzed for each group and three factors identified: Scenic Beauty, Natural Force, and Starkness. Factor scores were computed for each scene and group and for selected individuals. Some conclusions were: (1) the procedure yields a usable measure of preference which varies with the subject's familiarity with the scene, his or her occupation, and the life style; (2) scenes that include moving water are preferred over those with still water or no water; (3) naturally barren areas are seldom perceived as beautiful by most people; and (4) people tend to agree on what is very beautiful or very ugly but disagree on the in-between. SURVEY AND EVALUATION OF SOCIAL SCIENCE RESEARCH ON FLOOD-DAMAGE ABATEMENT,
Virginia Polytechnic Inst. and State Univ., Blacksburg.
S. K. Paulson, and W. E. Lawrence.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 638, Price codes: A06 in paper copy, A01 in microfiche. VA Water Resources Research Center VA Polytechnic Inst. and State Univ. B-114 Jun 79. 99 p, 19 tab, 169 ref, 2 append. OWRT A-074-VA(1).

Descriptors: Floods, *Flood damage, Institutions, Values, Attitudes, Bibliography, Economics, *Non-structural alternatives, Social aspects, Flood prevention.

Scientists--particularly engineers, biologists, geologists, and economists--continue to research ways of preventing damage to life and property from the flooding of lakes, rivers, and streams. As a result of such efforts, a variety of effective structural and non-structural flood-damage reduction methods have been developed. The human social aspects of such methods, however, have not been researched as extensively. This study documented the nature and extent of existing social science literature in this area and identified future research needs through six data collection efforts. Two types of information were compiled: social science research conducted to date and knowledgeable persons' perceptions of needed research. A bibliography of the most relevant extant materials was constructed, and the contents of each entry were analyzed. Results of this study indicate that most research on flood-damage reduction has focused on the economic and engineering aspects of the structural methods of damming and channeling and has been of the sponsored, case-study type of design. The sociological aspects of non-structural methods have received minor emphasis. Recommendations advocate additional research in the area of non-structural flood-damage reduction methods, focusing on such variables as the social attitudes, beliefs, and behavior of individuals, and social and political structure of communities.

J. M. Lishman, and T. K. Bick.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 640, Price codes: A11 in paper copy, A01 in microfiche. Report, 1977. 244 p, 2 tab.

Descriptors: *Evaluation, *Administrative agencies, *Federal government, *Environmental effects, *Waste water treatment, Land use.

A four-part analysis is presented of EPA performance, region by region, on land use impacts, compliance with legal requirements, and public participation in the 201 waste water treatment facility grants program. Regions 7 and 10 were the only regions consistently sending hearing notices to the Federation. Negative declarations in EIS's are thorough for Regions 2 and 10. Regions 3, 6, and 8 indicate impacts on environmentally sensitive resources such as wetlands, wildlife habitat, and flood plains, but the information provided is generally insufficient. Declarations of other regions are inadequate. The environmental appraisals of Region 2 and 10 are rated best, while Region 1, 3, 6, and 8 also mention secondary effects. Appraisals of Regions 5 and 7 failed to explore any primary or secondary impacts. Only two draft EIS were received. (Small-FRC)

THE JUVENILE FISH POPULATION IN THE MARGINAL AREAS OF THE HENDRIK VERWOERD DAM,
Cape Town Dept. of Nature and Environmental Conservation, Van der Kloofdam (South Africa). Rolfontein Nature Conservation Station.
J. A. Cambray, S. Hahndiek, and Q. Hahndiek.
Journal of the Limnological Society of Southern Africa, Vol. 4, No. 1, p 21-30, July 1978. 6 fig, 6 tab, 8 ref.

Descriptors: *Aquatic habitats, *Impounded waters, *Juvenile fish, *Fry, *Fish populations, Sampling, Equipment, Nets, Ecosystems, Ecology, Dams, Fish passages, Marginal utility, Verwoerd Dam, Orange River, South Africa.

Fish were sampled from a variety of habitats around the 350 km shoreline of the Hendrik Verwoerd Dam to determine which juvenile and small fish species are utilizing the marginal areas, to note the frequency of the species in different habitats, and to ascertain what length groups are using the areas sampled. Small seine nets were used in intensive three week surveys over two consecutive years during April when all fish species had bred and water temperatures were still high enough to attract juveniles into the shallows. To obtain a sample of fish from a given area other than by netting several areas were sectioned off from the dam and a pisicide was applied. A total of 6,848 fish were collected at 81 locations during the 1976 survey; 7,615 fish were collected during the 1977 survey at 113 sites. The length and composition of six identified species are discussed and correlated to habitat types. The results of the surveys indicate that inflowing spruits, sheltered areas in eroded gullies, and flooded vegetation are the important nursery areas in the dam. (Davison-IPA)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 875, Price codes: A07 in paper copy, A01 in microfiche. Report EPA 907/9-74-005, 1974. 125 p, 3 fig, 19 tab, 13 ref, 1 append.

Descriptors: *Sampling, *Measurement, *Analytical techniques, *Chemical analysis, *Data collections, Instrumentation, Monitoring, On-site data collections, Research equipment, Treatment plants, Waste water treatment, Water pollution control, Municipal wastes.

Thirteen brands of commercially available automatic waste water samplers were evaluated and tested under field conditions over a 1 yr period by the Field Investigations Section of the EPA. Waste water samples collected simultaneously with different automatic compositors and manual sampling methods demonstrated significantly different waste water chemistries during five separate sampler performance studies. A comparison of waste water samples collected with high vacuum samplers, slower acting samplers, and manual techniques indicated that high vacuum samplers collected concentrations of nonfilterable solids which were sometimes two- to three-fold those levels obtained by other sampling methods. The minimum variations in solids data, attributed to differences in samplers and collection techniques, ranged from 9-24%. Hydraulic measurement methods utilized in waste water sampling activities were also evaluated and incorporated weirs, flumes, recording equipment, wet well volume displacement, flow rates in pipes, and open channel flow. The precision of three individual flow measurements was found to be approximately 10%. (Lisk-FRC)

ECOSYSTEM ANALYSIS FOR WATERSHED MANAGEMENT,
Rocky Mountain Forest and Range Experiment Station, Flagstaff, AZ.; and Arizona Univ., Tucson.
D. R. Carder, F. R. Larson, J. J. Rogers, W. O. Rasmussen, and P. F. Ffolliott.
In: Proceedings, 21st Annual Arizona Watershed Symposium, Nov. 1, 1977, Tucson, Arizona. Arizona Water Commission Report No. 10, p 22-25 (1977). 1 fig.

Descriptors: *Model studies, *Simulation analysis, *Watershed management, *Systems analysis, *Water resources planning, Analytical techniques, Hydrologic data, Forecasting, Future planning, Forest management, Evaluation, Multiple-purpose projects, Arizona.

Land management practices are facing the dual need to exploit forest commodities and to provide recreational areas within those same forests at the same time. The multiresource management research program at Flagstaff, Arizona, known as the Beaver Creek Program, has been designed to simulate multiple-use management of forest watersheds through model computer studies known as ECOSIM, for Ecosystem Component Simulation Models. Its components include water, flora, and fauna. The designers of this program believe that inputs of water, sediment, and non-point source pollutants to a river system from a managed tributary watershed cannot be predicted or controlled effectively without dealing with the ecosystem as a whole, and they have, therefore, provided in their model estimates for sediment yields as well as nitrogen, phosphorus, thermal energy, and dissolved oxygen, both annually and for single storm events. The major climatic events and the actions of man that affect the three basic components will be represented by several additional groups of inter-active modules as the prototype version becomes operational. Trial applications of the ECOSIM prototype are expected to demonstrate the technological feasibility of developing a widely applicable easily usable system that will provide a substantially better basis for making forest-watershed management decisions when combined with professional experience and the viewpoints of concerned citizens. BETTER GUIDANCE AND CONTROLS ARE NEEDED TO IMPROVE FEDERAL SURVEYS OF ATTITUDES AND OPINIONS.
Comptroller General of the United States, Washington, DC.
September 15, 1978. 76 p, 9 append.

Descriptors: *Data collections, *Surveys, *Information exchange, *Sampling, *Federal Government, *Federal Reports Act, Census, Statistics, Research priorities, Administrative agencies, Public opinion, Data analysis, Questionnaires, Polls.

This report reviews Federal survey techniques and offers recommendations to Federal agencies so that they can better utilize surveys and polls to gain valuable public and technical opinion input. The report first describes the Federal Reports Act which governs federal information collection activities and then defines the scope of review. The six Federal agencies reviewed are the Departments of Commerce, Defense, Transportation, Interior, State, and the Federal Energy Administration

(FEA). The report identifies polls and surveys conducted by these agencies and examines five surveys in detail. These surveys include three opinion polls in the Dept. of Commerce called Project Feedback, one in the Transportation Dept. called Concorde Community Response, and one in the FEA entitled A Marketing Approach to Carpool Demand Analysis. These case studies are illustrated by charts and an in-depth critiquing of their methods is offered. Most of the 209 attitude surveys and public opinion polls utilized by Federal agencies were performed by contractors. The lack of statistical and survey expertise was a major problem for many federal agencies. Because of this lack of expertise, the agencies need detailed guidance and standards to familiarize them with potential problems. This guidance has been lacking from OMB which sets the standards for federal agencies in information gathering activities. The appendices list the titles of public opinion poll and attitude survey questionnaires used at the six Federal agencies and letters from directors of the information gathering departments in these agencies. ELECTROMETRIC DETERMINATION OF METALS IN WASTE WATERS CONTAINING SURFACTANTS: SUITABILITY OF DIFFERENTIAL PULSE ANODIC STRIPPING VOLTAMMETRY OF AN HANGING MERCURY DROP ELECTRODE,
George Washington Univ., Washington, DC. Dept. of Chemistry.
T. A. Getek, and W. E. Schmidt.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A053 287, Price codes: A05 in paper copy, A01 in microfiche. Report, 1978. 67 p, 9 fig, 17 tab, 211 ref.

Descriptors: *Electrodes, *Analytic techniques, *Metals, *Waste water(Pollution), *Electrochemistry, Zinc, Copper, Cadmium, Lead, Surfactants, Adsorption, Performance.

The effects of organic constituents on the electrometric determination of metals in waste waters were investigated. The primary electrometric method studied was differential pulse anodic stripping voltammetry. The three parts of the investigation included: Intermetallic compound formation of zinc and copper using differential pulse anodic stripping and voltammetry with a hanging mercury drop electrode; Effects of organic surface activating substances on differential pulse anodic stripping voltametry; And, review of the use of anodic stripping voltammetry for trace analysis. In the first part, a study was made of the limiting concentrations at which an intermetallic compound has an adverse effect on the calibration of zinc and copper at a hanging drop electrode in the differential pulse mode. In the second part, the interference of surface activating substances was investigated to eliminate the surfactants if necessary. An adsorptive technique was suggested for trace measurements in ideal samples. In part three, a comprehensive review of the literature was undertaken to compile information on the applicability of differential pulse anodic stripping voltammetry to the determination of zinc, cadmium, lead, and copper waste water. Stripping analysis, interferences, applicability and reproducibility, and purification are considered. (Small-FRC)

ACCURACY OF IMPERVIOUS AREA VALUES ESTIMATED USING REMOTELY SENSED DATA,
Science and Education Administration, Beltsville, MD. Hydrology Lab.
T. J. Jackson, and R. H. McCuen.
Water Resources Bulletin, Vol. 15, No. 2, p 436-446, April 1979. 5 fig, 1 tab, 6 ref.

Descriptors: *Remote sensing, *Hydrologic data, *Model studies, Satellites(Artificial), Land use, Vegetation, Classification, Sampling, Data collections, Data processing, Analytical techniques, Hydrology, LANDSAT.

Remote sensing offers an attractive alternative to conventional data collection employed in the estimation of certain hydrologic model parameters. In this investigation, the standard error of parameters estimated from Landsat data was examined. Relationships between the standard error and the size of the spatial-modeling units were developed that allow extending results to larger areas. Based upon the investigations conducted, a generalized model of the error relationships could not be developed. (Sims-ISWS)

RAPID RESPONSE TENSIOMETER FOR EVALUATING PREPLANT IRRIGATION EFFICIENCY,
C. W. Wendt, and H. P. Harbert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 897, Price codes: A04 in paper copy, A01 in microfiche. Texas Water Resources Institute, Texas A and M University, College Station. Technical Report No. 102, April 1979. 70 p, 12 fig, 23 fig, 16 ref, 1 append. OWRT C-7642(7252)(2).

Descriptors: *Tensiometers, *Irrigation efficiency, *Irrigation practices, Irrigation design, Soil moisture, Soil physical properties, Soil moisture meters, Instrumentation, Soil types, Soil water, Infiltration, Water utilization, Clay loam, Infiltration rates, Nuclear moisture meters, Lubbock(Texas), Halfway(Texas).

A study was undertaken to determine whether rapid response tensiometers can be used to evaluate, reliably and conveniently, the efficiency of preplant irrigation. Study sites were an Oltan loam soil at Lubbock and a Pullman clay loam at Halfway in Texas. Both portable rapid response and permanently installed tensiometers were used to measure soil water potential; a neutron probe measured the soil water content. A methonal-water mixture was substituted for the water in the permanent tensiometers to keep them from freezing. The problems encountered after the rapid response tensiometers were installed, cracked bulbs and clogging of the pores of the bulbs with soil and clay, resulted in slow response time and inaccurate readings. When the rapid response tensiometers were working properly the readings obtained compared favorably with those from the permanent tensiometers. The permanently installed tensiometer and the neutron soil moisture probe yielded good data for evaluating the efficiency of preplant irrigation from furrow irrigation. Application efficiencies ranged from the water source, flow rate, content. Small amounts applied to dry soils at fast flow rates were generally the most efficient applications. (Davison-IPA)

NATIONAL INVENTORY OF MUNICIPAL WATERWORKS AND WASTEWATER SYSTEMS IN CANADA 1977.
Environmental Protection Service, Ottawa (Ontario). Water Pollution Control Directorate.
1977. 339 p, 2 app.

Descriptors: *Census, *Cities, *Municipal water, *Water sources, *Water works, Wastewater treatment, Waste water disposal, Data collections, Indexing, Canada, *National inventory, *Questionnaires.

In 1974, the provincial and federal governments, in cooperation with the Federation of Associations on the Canadian Environment undertook a major inventory of municipal water and wastewater services in Canada. The results of this work were published as the 'National Inventory of Municipal Waterworks and Wastewater Systems in Canada - 1975'. In order to maintain this comprehensive and verified data source an update of the inventory was completed in early 1978 and a summary of this update is provided. (WATDOC)

LOCAL ENVIRONMENTAL MANAGEMENT-CAN IT WORK. A CASE STUDY OF THE VIRGINIA WETLANDS ACT,
Virginia Inst. of Marine Science, Gloucester Point.
J. C. Jones, and M. P. Lynch.
Coastal Zone Management Journal, Vol. 4, No. 1-2, p 127-49, 1978.

Descriptors: *Virginia, *Coastal marshes, *Land development, *Wetlands, Coasts, Water conservation, Regulation, Planning, Local governments, Legislation, Permits.

The Virginia Wetlands Act of 1972 provides the localities of Tidewater, Virginia--cities counties and towns, which interact most directly with the wetlands of the state--an opportunity to participate in the management of the state's coastal wetlands resources. This study attempts to analyze the effectiveness of this legislation and to examine the implications of local management scheme for coastal resource management on a broader scale. Criteria are established that can be used to evaluate the effectiveness of such a law. When examined in the light of these criteria, the Virginia Wetlands Act emerges, for the most part as an effective piece of environmental quality legislation that has had a significant impact on wetlands destruction in the state of Virginia. During the two year period following the passage of the Act, wetlands losses through the permitting process showed an 18-fold decrease from previous estimate. The Wetlands Act appears to have been generally accepted by the public and has resulted in consistently uniform decisions, which have reduced wetland losses without unduly restricting the necessary and legiti-

mate development of the states wetlands. (Fortin-Florida)

SOLVE LINEAR PROPORTIONAL WEIR DESIGN QUICKLY,
Indian Inst. of Tech., Bombay.
B. S. Pani, and A. S. Ramurthy.
Water and Wastes Engineering, Vol. 16, No. 1, p 50-53, January 1979. 7 fig, 2 tab, 1 ref.

Descriptors: *Weirs, *Design, *Hydraulic design, *Flowmeters, Discharge(Water), Measurement, Theoretical analysis, Overflow, Laboratory tests, Discharge measurement, Discharge coefficient, Rating curves, Linear proportional weir, Head-discharge relationship.

By properly choosing the geometric parameters, a linear head discharge relationship can be achieved for simple quadrant plate weirs which have triangular and circular forms for the base weir. Studies have indicated that a simple quadrant plate weir with a rectangular base weir has linear head-discharge characteristics. The present study was related to the characteristics of the quadrant plate weir having other geometric shapes for the base weir. A linear head-discharge relationship is obtained for these weirs by properly choosing the geometric parameters of the weir. The effect of the base weir shapes on the characteristics of the weir flow was examined. Design curves were presented for the quadrant plate weirs which have the conventional shapes for the base weir, namely, the rectangular, the triangular, and the arc of a circle. (Humphreys-ISWS)

MAPPING OF SEA ICE AND MEASUREMENT OF ITS DRIFT USING AIRCRAFT SYNTHETIC APERTURE RADAR IMAGES,
Technische Hochschule, Graz (Austria).
F. Leberl, M. L. Bryan, C. Elachi, and T. Farr.
Journal of Geophysical Research, Vol. 84, No. C4, p 1827-1835, April 20, 1979. 8 fig, 26 ref, 2 append.

Descriptors: *Sea ice, *Mapping, *Alaska, *Remote sensing, *Tracking techniques, *Arctic, Movement, Measurement, On-site investigations, Surveys, Instrumentation, Methodology, Analysis, Analytical techniques, Algorithms, Radar, *Prudhoe(AL), Side-looking radar.

Side-looking radar images of Arctic sea ice were obtained as part of the Arctic Ice Dynamics Joint Experiment. Repetitive coverages of a test site in the Arctic were used to measure sea ice drift, employing single images and blocks of overlapping radar image strips; the images were used in conjunction with data from the aircraft inertial navigation and altimeter. Also, independently measured, accurate positions of a number of ground control points were available. Initial tests of the method were carried out with repeated coverages of a land area on the Alaska coast (Prudhoe). Absolute accuracies achieved were essentially limited by the accuracy of the inertial navigation data. Errors of drift measurements were found to be about + or - 2.5 km. Relative accuracy is higher; its limits are set by the radar image geometry and the definition of identical features in sequential images. The drift of adjacent ice features with respect to one another could be determined with errors of less than + or - 0.2 km. (Humphreys-ISWS)

WATER RESOURCES DATA FOR NEW YORK, WATER YEAR 1978--VOLUME 1. NEW YORK EXCLUDING LONG ISLAND.
Geological Survey, Albany, NY. Water Resources Div.
Geological Survey Water-Data Report NY-78-1, April 1979. 520 p, 8 fig, 1 tab.

Descriptors: *New York, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water anaysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1978 water year for New York consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; water quality of precipitation; and water levels and water quality of ground-water wells. This volume contains records for water discharge at 188 gaging stations; stage only at 22 gaging stations; stage and contents at 21 lakes and reservoirs; water quality at 67 gaging stations, 10 precipitation stations, and 10 wells; and water levels at 44 observation wells. Also included are data for 144 crest-stage, 20 low-flow, and 7 water-quality partial-record stations. Additional water data were collected at various sites not involved in the systematic data-collection program and are published as miscellaneous measurements and analyses. These data together with the data in volume 2 (Long Island) represent that part of the National Water Data System operated by the U.S. Geological Survey in cooperation with State, Federal, and other agencies in New York. (Woodard-USGS)

WATER RESOURCES DATA FOR NEW YORK, WATER YEAR 1978--VOLUME 2. LONG ISLAND.
Geological Survey, Albany, NY. Water Resources Div.
Geological Survey Water-Data Report NY-78-2, February 1979. 264 p, 8 fig, 1 tab.

Descriptors: *New York, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Long Island(NY).

Water resources data for the 1978 water year for New York consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; water quality of precipitation; and water levels and water quality of ground water wells. This volume contains records for water discharge at 16 gaging stations; water quality at 18 gaging stations, 403 wells, and 2 precipitation stations; and water levels at 123 observation wells. Also included are data for 81 low-flow partial-record stations. Additional water data were collected at various sites not involved in the systematic data-collection program, and are published as miscellaneous measurements and analyses. These data together with the data in volume 1 represent that part of the National Water Data System operated by the U.S. Geological Survey in cooperation with State, Federal, and other agencies in New York. THE TUSCALOOSA AQUIFER SYSTEM IN MISSISSIPPI,
Geological Survey, Jackson, MS. Water Resources Div.
E. H. Boswell.
Geological Survey Water-Resources Investigations 78-98 (open-file report), 1978. 3 sheets, 25 fig, 2 tab, 31 ref.

Descriptors: *Mississippi, *Groundwater resources, *Aquifer characteristics, *Water quality, *Water utilization, Maps, Water wells, Water levels, Well data, Water yield, Groundwater availability, Water supply, *Tuscaloosa Group, Gordo Formation, Coker Formation, Lower Cretaceous series, Cretaceous aquifers.

A three-sheet map report describes the Tuscaloosa aquifer system in Mississippi. The Tuscaloosa aquifer system, of Cretaceous age, is in the interconnected irregular sand and gravel beds in the Coker and Gordo Formations. The aquifer contains freshwater in an area of about 9,000 sq mi in northeastern Mississippi. Water produced from the aquifer by about 90 water systems and numerous industries in 1975 averaged about 47 Mgal/d. Regional water level declines have averaged less than two feet per year and the aquifer has a large potential for future development. The aquifer is used in some areas where the dissolved-solids concentration is more than 500 mg/L and where wells exceed 2,000 ft in depth. The most common problems in water supplies are excessive chloride and iron. (Woodard-USGS)

Descriptors: *Maps, *Water pollution sources, *Urbanization, *Waste disposal, *Connecticut, Industrial waste, Sewage, Water treatment, Urban runoff, Sampling, Water quality control, Water analysis, Aquifers.

A map of Connecticut, scale 1:125,000, shows locations of 159 State, municipal, and private sewage treatment facilities, 325 sites of industrial effluent discharge, and 47 surface-water sampling sites. Built-up areas (source of urban runoff) and favorable aquifers are also delineated. (Woodard-USGS)
W79-07021

DISPOSAL OF SOLID WASTES IN CONNECTICUT,
Geological Survey, Hartford, CT. Water Resources Div.
J. L. Rolston, T. H. Pregman, and E. H. Handman.
Availability: Branch of Distribution, USGS 1200 S. Eads St. Arlington VA 22202 Price $.75. Geological Survey Miscellaneous Field Studies Map MF-981-B, 1978. 1 sheet.

Descriptors: *Maps, *Waste disposal, *Solid wastes, *Connecticut, *Landfills, Incineration, Water pollution sources, Water quality control, Aquifers.

A map of Connecticut, scale 1:125,000, shows more than 250 sites concerning solid waste disposal. The sites include incinerators, industrial waste, bulky or demolition waste, mixed waste and waste-transfer stations. Closed as well as active facilities and their relation to favorable aquifers are shown. Groundwater contamination is reported at 14 of the sites. (Woodard-USGS)
W79-07022

WATER AVAILABILITY, CHAMBERS COUNTY, ALABAMA,
Geological Survey, University, AL. Water Resources Div.
R. V. Chandler, and G. C. Lines.
Alabama Geological Survey Map 133, 1974. 29 p, 10 fig, 4 tab, 14 ref.

Descriptors: *Available water, *Groundwater resources, *Surface waters, *Water quality, *Water utilization, Maps, Streamflow, Well data, Water levels, Aquifers, Water analysis, Chemical analysis, Alabama, *Chambers County.

Large quantities of surface water are available for use in Chambers County, Ala. Without storage, supplies of 100 Mgal/d (million gallons per day) or more are available from the Chattahoochee and Tallapoosa Rivers; 10 Mgal/d or more are available from five of the larger creeks in the county; and 2 Mgal/d or more are available from six other creeks in the county. Even larger quantities are available from streams by providing storage. Only small to moderate quantities of ground water are available from wells penetrating metamorphic rocks in the county. Some wells produce as much as 75 gal/min (gallons per minute), but most wells produce less than 10 gal/min. Water in the county is of good chemical quality and is suitable for most uses. Surface water is soft and has a low dissolved-solids content. Water in most streams is neutral to slightly alkaline. Ground water ranges from soft to hard but generally is soft. Iron in ground water locally contains more than 0.3 milligrams per liter but, otherwise, is suitable for most uses. Total water use in the county in 1969 was estimated to be only about 3.9 Mgal/d, which is less than 1 percent of the amount of water available for use. Estimated surface-water withdrawal is about 3.3 Mgal/d, most of which is for industrial and municipal supplies. About 0.6 Mgal/d of ground water is withdrawn for domestic and irrigation supplies. (Woodard-USGS)
W79-07023

WATER AVAILABILITY IN BIBB COUNTY, ALABAMA,
Geological Survey, University, AL. Water Resources Div.
L. V. Causey, J. R. Willmon, and J. S. Ellard.
Alabama Geological Survey Map 144, 1978. 16 p, 3 fig, 2 plates, 3 tab.

Descriptors: *Available water, *Groundwater resources, *Surface waters, *Water quality, *Water utilization, Maps, Streamflow, Well data, Water levels, Aquifers, Water analysis, Chemical analysis, Alabama, *Bibb County.

The largest sources of water in Bibb County in central Alabama are limestone, dolomite, and sand aquifers, and Cahaba and Little Cahaba Rivers. Potential sources of 0.5 Mgal/d (million gallons per day) or more per well are limestone and dolomite aquifers in topographic lows in the northern part of the county; limestone and dolomite aquifers in topographic lows and along faults in the central part; and sand aquifers in the southern part. The total average flow of all streams in the county is about 1,260 Mgal/d, of which 590 Mgal/d originates within the county. The Cahaba River at Centreville has an average flow of 1,000 Mgal/d and a 7-day Q2 (median annual 7-day low flow) of about 130 Mgal/d. The Little Cahaba River near Brierfield has an average flow of 130 Mgal/d and a 7-day Q2 of about 30 Mgal/d. Wells in northern and central parts of the county are rarely drilled deeper than 300 feet. Wells in the southern part of the county generally range in depth from 150 feet in the Cahaba River valley to 800 feet in upland areas. Water from aquifers and streams in Bibb County is generally of suitable chemical quality for most uses. Water from sand and sandstone aquifers is generally soft to moderately hard and generally contains iron in excess of 0.3 mg/L (milligrams per liter). Water from limestone and dolomite aquifers is generally moderately hard to hard and has an iron content less than 0.3 mg/L. Water from streams is generally soft to moderately hard and has a dissolved-solids content of less than 150 mg/L. The average use of water in Bibb County in 1969 was about 1.4 Mgal/d which is less than 1 percent of the quantity available. (Woodard-USGS)

MATHEMATICAL MODELING OF DRAINAGE WATERSHEDS,
Florida Univ., Gainesville. Dept. of Agricultural Engineering.
K. L. Campbell, H. P. Johnson, and S. W. Melvin.
Meeting preprint 2373, American Society of Civil Engineers Annual and National Convention, Kansas City, MO, October 21-25, 1974. 17 p, 6 fig, 18 ref, 1 append. ASCE, New York. OWRT A-024-IA(4).

Descriptors: *Model studies, *Computer models, *Mathematical models, *Drainage practices, *Watershed management, Surface runoff, Hydrology, Hydrologic systems, Flood forecasting, Flood control, Flow rates, Water quality, Nutrients, Sediments, Iowa State Hydrologic Model.

Recent research evaluating mathematical models in determining the hydrologic response of watersheds to drainage practices is examined. A discussion of the results and views of various drainage practices reveals that complex interactions take place in hydrologic systems when the environment is modified by artificial drainage. Two watershed models and the types of parameters are considered: the deterministic or simulation approach which is composed of many component models, each of which represents one of the hydrologic processes; and the conceptual type model in which some parameters are determined by fitting. A mathematical model, the Iowa State University Hydrologic Model, developed from a deterministic simulation approach is described and illustrated by a schematic diagram. The increasing accuracy of the numerous approximations of this model must be evaluated with regard to the resulting increased computer costs. Mathematical models depicting the rates and quantities of flow under various hydrologic conditions and degrees of drainage also offer the opportunity to model the quality of water flowing from drainage watersheds. Because of the many interacting factors affecting watershed response, it is concluded that mathematical models are the only available tool to explore the magnitude and type of hydrologic response, qualitatively and quantitatively, which result from combinations of drainage practices. FIELD INVESTIGATION OF SHIPBOARD/SHORESIDE SEWAGE TRANSFER SYSTEMS AT THE SAN DIEGO NAVAL STATION,
Pollution Abatement Associates, Corte Madera, CA.
R. W. Urban, D. J. Graham, and F. J. Campbell.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A048 974, Price codes: A12 in paper copy, A01 in microfiche. Report 1978. 150 p, 55 fig, 13 tab, 2 append.

Descriptors: *Ships, *Sewerage, *On-site tests, *Sewage disposal, *Water pollution sources, Regulation, Design, Waste water.

Field tests were conducted of Navy ship-to-shore sewage transfer including tests of installed shipboard Collection, Holding, and Transfer systems (CHT). Procedures for connecting and disconnecting nests of ships were developed and documented. Also, the effect of pier sewer system loading by multiple ship sewage discharge was examined. Sewage generation rates from activated CHT systems were monitored. Shipboard CHT systems and pierside sewers were a simple and effective way to transport shipboard waste to treatment facilities on the shore. Work with 21 different ships yielded various recommendations, including shipboard CHT operating procedures, shipboard CHT hard-

ware, shoreside hardware and procedures, and shipboard CHT activation. The major problem encountered during the field tests was the general reluctance of all ships to begin operation of CHT systems, although many were certified or near certification. Most systems had sufficient problems to justify postponing use until required by law. In some cases, an additional week of work was necessary to activate the CHT system. Activation of key vessels in key ports will make the use of CHT more widespread and more visible throughout the fleet. (Small-FRC)

DRAKENSBERG SCHEME IN FULL SWING,
J. B. Bowcock.
South African Tunnelling: Vol. 2, No. 4, Supplement to Construction in S. A. and Coal, Gold, and Base Minerals of S. A., p 6-9, 11-13, July 1978. 5 fig, 3 ref.

Descriptors: *Tunneling, *Tunnels, *Water storage, *Pumped storage, *Pumping plants, *Storage, *Electricity, Excavation, Rock mechanics, Geology, Geologic investigations, Underground, Construction, Drilling equipment, Contract, Testing, Structures.

The Drakensberg Pumped Storage Scheme, currently under construction near Bergville, Natal, will be used to store surplus off-peak energy for the Electricity Supply Commission (Escom); it will also pump water over the Drakensberg escarpment into the Vaal catchment for the Department of Water Affairs. The project is sited within rock of the Beaufort series of the Karoo System beneath the south facing slope of the escarpment. In addition to sandstones, siltstones, and mudstones, there are occasional thin carbonaceous seams of poorly developed fossil leaf remains. The presence of these seams means that all underground work must be done under mine fire regulations because of the possibility of flammable gases. The exploratory phase geological investigation program included: (1) geological investigations comprising excavation of shafts and adits, core drilling from the surface and underground, permeability tests in boreholes, and geophysical investigations; (2) geotechnical testing comprising plate bearing tests, in situ stress measurements, and borehole modulus tests. A double corrosion protected system is used in the main halls to protect the rock bolts of the main support, because of high chloride content in the water. The construction contracts are discussed. (Davison-IPA)

KOEBERG HARBOUR FEATURES AN IMPERVIOUS BREAKWATER,
W. Robinson.
Construction in Southern Africa, Vol. 23, No. 4, p 20-25 and 29, July 1978. 7 fig.

Descriptors: *Powerplants, *Nuclear powerplants, *Breakwaters, *Water cooling, Engineering structures, Intakes, Dredging, Construction materials, Precast concrete, Rockfill dams, Koeburg Harbor(South Africa).

South Africa's first nuclear power station is being constructed on the Atlantic coast 35 km north of Capetown. All water required for cooling the power station turbine condensers will be taken from the sea. Rough sea swells in the area of the power station necessitated the incorporation of an impervious breakwater. The intake basin to be built around the cooling water inlet will prevent rough water from entering the water inlet structure and will inhibit the warm water from the cooling water outlet from directly re-entering the inlet structure. This basin will be formed by two breakwaters constructed in rockfill with precast concrete dolosse armoring and mass concrete capping. Breakwater construction details are given. The layout of the site is described. (Davison-IPA)

FLOATING BREAKWATER,
R. B. Fuller.
U.S. Patent No. 4,136,994, 9 p, 9 fig, 6 ref; Gazette of the United States Patent Office, Vol. 978, No. 5, p 1718, January 30, 1979.

Descriptors: *Patents, *Breakwaters, *Coastal structures, Floating, Waves(Water), Energy, Shore protection, Energy conversion, Turbines.

A floatable breakwater comprises an open grid with a troughlike membrane suspended below the grid. Inner membrane components which are also suspended from the floatable grid serve to define various ports or apertures through which the water is moved and churned as the breakwater is lifted by a passing wave and thereby dissipate energy from the wave. These inner membrane components may have a truncated tetrahedral configuration converging downward in the manner of multiple funnels so that the water contained within the respective tetrahedron is ejected downwardly into the outer troughlike membrane when each passing wave momentarily elevates the breakwater. A turbine may be positioned at one end of the breakwater for converting the energy of the longitudinal flow of water out of the troughlike membrane into electric power. (Sinha-OEIS)

THE CONVERGENCE OF IMPLICIT BED TRANSIENT MODELS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. M. Ponce, H. Indlekofer, and D. B. Simons.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY4, Proceedings Paper 14493, p 351-363, April 1979. 7 fig, 8 ref, 2 append.

Descriptors: *Alluvial channels, *Model studies, *Attenuation, *Beds, Celerity, Hydraulics, Numerical analysis, Rivers, Unsteady flow, Sedimentation, Sediments, *Channel beds, Convergence.

A comprehensive theoretical treatment of the convergence of the four-point implicit numerical model of alluvial channel bed transients was presented. The dimensionless celerity and logarithmic decrement of the analytical and numerical solutions were calculated. Convergence was tested by establishing the ratio of celerities (translation convergence) and the ratio of attenuation factors (attenuation convergence). Two physical and three numerical parameters were identified: the equilibrium flow Froude number, the transient flow dimensionless wave number, the spatial resolution, the Courant number, and the weighting factor of the scheme. A REVIEW OF SOUTH AFRICA'S PROSPECTS FOR POWER FROM THE OCEAN,
Cape Town Univ. (South Africa).
G. Nuric.
South African Mechanical Engineer, Vol. 28, No. 7, p 274-282, July 1978. 9 fig, 5 tab, 18 ref.

Descriptors: *Ocean waves, *Energy conversion, *Tidal energy, *Tidal powerplants, Electric power, Electric powerplants, Electric power production, Currents(Water), Ocean circulation, Ocean currents, Tidal waters, Economics, Capital costs, Research and development, South Africa.

The various systems by which energy may be harnessed from the ocean are discussed; wave power is emphasized. Wave data taken during all seasons from several locations along the South African coastline were analyzed to determine the average power density available. At distances up to 30 km off-shore as much as 50 kW/m of wavefront are available; 10 kW/m of wavefront is available up to 1 km off-shore. Several wave power generating systems being developed on a worldwide basis are described. These ocean energy extractors are non-polluting in that they do not introduce new chemicals or heat into the atmosphere. They may introduce a temporary diversion of heat and there possibly may be small spillages of oil from hydraulic or lubrication circuits. The use of these devices as a breakwater could produce an alteration of the sea bed and modify coastal erosion and deposition patterns. Initial costs of wave power systems are high. According to a 1974 estimate, a 50 kW plant could cost R600/kW; with a 10% annual inflation rate the cost could rise to R800/kW in 1977. (Davison-IPA)

FLUID FLOW AND HEAT TRANSFER THROUGH HYDRAULICALLY INDUCED FRACTURS IN HOT, DRY ROCK MASSES,
Northwestern Univ., Evanston, IL. Technological Inst.
S. Nemat-Nasser, and H. Ohtsubo.
Journal of Pressure Vessel Technology, Vol. 100, p 276-284, August, 1978. 9 fig, 9 ref.

Descriptors: *Geothermal studies, *Flow, *Heat transfer, *Fractures(Geologic), Hydraulic fracturing, Rocks, Fracture permeability, Energy equation, Fluid mechanics, Momentum equation, Finite element analysis, Thermal conductivity.

Geothermal energy can be obtained from hot, dry rocks through hydraulic fracturing followed by circulation of water under pressure through the fractures and back to the ground surface. The fractures initially are very small but expansion of these fractures and formation of secondary fractures perpendicular to them results from thermal contraction. Basic two-dimensional field equations for fluid flow and heat transfer were obtained by integrating three dimensional mass, linear momentum and energy equations over the crack width. The importance of the various terms in these equations is briefly discussed, and on this basis the corresponding equations are simplified. For the steady-state case, a finite element numerical solution is presented along with illustrative examples. These examples reveal that a more accurate estimate for the effective conductivity between fluid and solid must be obtained in order to more realistically estimate the basic heat extraction process. In particular, the effect of secondary cracks must be carefully examined through further research. (Purdin-NWWA)

HYDRAULIC CHARACTERISTICS OF THE WHITE RIVER STREAM BED AND GLACIAL OUTWASH DEPOSITS AT A SITE NEAR INDIANAPOLIS, INDIANA,
Indiana Dept. of Natural Resources, Indianapolis.
W. Meyer.
Journal of Research of the U.S. Geological Survey, Vol. 6, No. 2, p 273-283, March-April, 1978, 11 fig, 1 tab, 8 ref.

Descriptors: *Aquifer testing, *Glacial aquifers, *Indiana, Aquifer characteristics, Stream-aquifer relationships, Hydraulic conductivity, Specific yield, Transmissivity, Streambeds, Hydrograph analysis, Well spacing, Leakage.

An aquifer test was made in the glacial-outwash aquifer underlying the White River and Fall Creek in Marion County, Indiana, to define the hydraulic connection between these streams and the aquifer and determine the hydraulic characteristics of the aquifer. This knowledge is essential for proper design and spacing of wells. The data were analyzed for an assumed condition of negligible transient leakage from the clay lens underlying this unit. Because no observation wells were installed in the clay lens, this assumption cannot be directly substantiated. However, observation wells beneath the clay lens indicated that a head loss was not induced below the clay lens by the test well. The analysis of the test data was complicated by a minor flood pulse on the White River. Background data on the response of ground water levels to changes in stream stage were used in the analysis of the aquifer-test data. Lateral hydraulic conductivity of the upper sand and gravel unit at the test site was determined to be 108 m/d. Transmissivity ranged from 1500 to 1670 m2/d. the specific yield was determined to be 0.08. The vertical hydraulic conductivity of the streambed was calculated to be 2.2 m/d. (Purdin-NWWA)

MULTIPLE OPERATING POINTS IN COMPLEX PUMP NETWORKS,
Southern Methodist Univ., Dallas, TX. School of Engineering and Applied Science.
M. A. Collins, L. Cooper, and J. L. Kennington.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY3, p 229-244, March 1979. 8 fig, 1 tab, 27 ref, 2 append. OWRT C-3355(3739)(6).

Descriptors: *Pumping, *Pipe flow, Networks, Model studies, Mathematical models, Pumps, Pipes, Pipelines, Pressure head.

Pump networks are pipe networks in which most head changes are produced by pumps. When nonmonotonicity exists in one or more pump characteristic curves, possibility of multiple operating points exists. An optimization model for steady state networks of arbitrary topology, complexity, and size was presented. Stationary points of the optimization model defined possible operating points. Uniqueness conditions as well as conditions for possible multiple operating points were identified. Operating points can correspond to minimums, maximums, or saddle points of the optimization model objective function. A two pump network example illustrated the different possibilities. It was concluded that the stationary point character defines the relative stability of different steady state operating points. (Sims-ISWS)

INFLUENCE OF PUMPED STORAGE FLOWS ON THERMAL STRATIFICATION IN RESERVOIRS,
West Virginia Univ., Morgantown, WV. Dept. of Mechanical Engineering and Mechanics.
V. Singh, R. A. Bajura, and S. H. Schwartz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 131, Price codes: A08 in paper copy, A01 in microfiche. Final Report, January 1979, 155 p, 73 fig, 6 tab, 55 ref, 3 append. OWRT C-7171(214)(5). 14-34-0001-6214.

Descriptors: *Pumped storage, Hydraulic models, Turbulence, Mixing, Froude number, Tailrace, Reservoirs, Stratification, Reynolds number, Buoyancy, Numerical analysis, Hydraulic structures.

The characteristics of buoyant submerged horizontal jets which simulate the discharge from power plants were found to be dependent upon the Froude number and the jet and ambient water temperatures. The concentration of salt solutions used to simulate the buoyancy mechanism in some of the tests was observed to alter the mixing characteristics of the jets. A series of tests was conducted to determine the mixing which would occur in two tanks simulating a pumped storage reservoir system after a number of cycles of operation. The mixing in the reservoirs was also simulated using a numerical computational scheme in two dimensions. The numerical predictions were in qualitative agreement with the experimental results. In several tests the vertical scale was exaggerated compared to the horizontal scale of the model in order to facilitate measurements and flow observations. When a simulated 200 MW power plant was operated with models which were distorted vertically by a factor of 3 and 5, respectively, the mixing in the distorted system was significantly greater than the mixing observed in the nondistorted model. It is expected that the use of distorted models will introduce large errors in the prediction of the performance of a prototype system.

8C. Hydraulic Machinery

THE RANCE POWER STATION,
Imiesa, Vol. 3, No. 9, p 12-15. 1978, 11 fig.

Descriptors: *Tidal powerplants, *Hydroelectric power, *Rance Power Station(France), Tidal energy, Tidal effects, Water level fluctuations, Turbines, Generators, Power system operation, Facilities, Electric power demand, Electric power production, Tides.

The tidal power station at the mouth of the River Rance, the first plant in the world to harness tidal energy, has a total output of 240 MW when all 24 generators are in operation. The plan, begun in 1961 and completed six years later, is based on the 'bulb' type generator which permits combining of pumping and generating cycles. The generator can operate as a direct turbine (basin-to-sea), and as a direct pump (sea to basin) or reverse. By selecting the methods of combined operation it becomes possible to overcome the limitations imposed by the lunar rhythm to concentrate on power production during hours of maximum demand. Pumping, always done at times of loss of head, uses off-peak electricity. The operation of the powerplant and the layout of the station are described. (Davison-IPA)

A BOREHOLE PROBE FOR SAMPLING GROUNDWATER FROM SELECTED STRATA,
Council for Scientific and Industrial Research, Pretoria, (South Africa). Technical Services Dept.
E. M. Thain, and P. H. H. Trendler.
Water S. A., Vol. 4, No. 2, p 49-53, April 1978. 6 fig.

Descriptors: *Hydraulic machinery, *Pumps, *Groundwater, *Boreholes, Equipment, Sampling, Testing, Electric wiring, Research equipment, Research and development, Instrumentation.

A borehole sampling device capable of collecting groundwater samples up to a maximum depth of 200 m is described. Portions of the borehole are sealed off by the device, allowing the water between the seals to be pumped to the surface for age determination, or to be collected in canisters for trace metal and chemical analysis. This device contains a submersible pump, and consists of a probe, sample holder canisters, a water sensing mechanism, a specially designed lowering device with electrical winch, clamps, and a drum for the electric cables and plastic tubes. The device operated successfully during testing of the probe and lowering mechanism. Preliminary tests indicate that the probe will be able to pump water to the surface from specific strata for age determination sampling. A schematic diagram of the probe is provided. (Davison-IPA)

PREVENTATIVE MAINTENANCE: YOUR MOST IMPORTANT INVESTMENT.
Water Well Journal, Vol. 33, No. 6, p 51-54, June, 1979.

Descriptors: *Drilling equipment, *Maintenance, *Safety, Lubricants, Investments.

Factors to consider in selecting a suitable drilling rig are capacity, average hole size, operating location, amoung of use, and the type of maintenance required. Preventive maintenance of a drilling rig is essential for warranty protection and getting the most out of the rig. If properly selected and used, a regularly serviced drilling rig can operate for more than 8000 hours without requiring an overhaul or major repairs. Basic maintenance procedures for drilling rigs are outlined. Service steps for various parts are given in daily, weekly, biweekly, monthly, bimonthly, quarterly, and semi-annual intervals. Proper lubrication is the key to good maintenance for any part. Thinner oils are required for very cold climates while, in hot weather, heavier oils are recommended. For altitudes greater than 8000 feet a turbocharger should be added to the engine. Recommended safety precautions are listed which will prevent damage to the machine and insure the safety of the crew. (Purdin-NWWA)

SLIMES DAMS: PROFESSIONAL EXPERTISE FOR SUCCESS,
J. Caldwell.
S. A. Mining and Engineering Journal, Vol. 89, No. 4143, p 43 and 47, August 1978.

Descriptors: *Dams, *Dam construction, *Dam design, *Mining engineering, *Waste disposal, Settling basins, Mine wastes, Design criteria, Inspection, Construction, Water requirements, Erosion control, Rainfall, Runoff, Barriers, Evaporation control.

Group 8D—Soil Mechanics

The essential aspects for the successful design and construction of slimes dams are examined. To determine the size of the dam and its length of useful life, it is necessary to ascertain the quantity of proven ore reserves and estimate the probably ore reserves; milling process information should be defined and the physical nature of slimes must be known. The type of operation must be selected. Theoretical design considerations include stability under static and dynamic loading, retention of all precipitation (rain), retention of runoff through barrier and evaporation dams, and storage capacity of at least 0.5 m above the maximum expected water level. Barrier dams should be provided at the toe of all dams and dumps to contain runoff resulting from precipitation on slimes dams and dumps, to control and contain eroded material erosion from the side of the slimes dam, and to act as evaporation dams. Settling ponds may be preferable to barrier dams in areas of steep topography. A check list for periodic dam inspection is discussed. It is concluded that the success of the design depends on bringing these divergent elements together. (Davison-IPA)

GLASS FIBRE PROTECTION FOR OUR LIFE LINES,
South African Bureau of Standards, Bulletin 7, No. 7, p 431-433, April 1978. 2 fig.

Descriptors: *Coatings, *Protective coatings, *Corrosion control, *Reinforcements, *Standards, Specifications, Glass fiber, South African Bureau of Standards, Coal tar coatings, Bituminous materials, Linings, Tensile strength, Binders, Porosity.

The South African Bureau of Standards has produced SABS 1130, a specification covering the quality of three types of glass fiber reinforcing material. Type 1 is a glass fiber mat with low tensile strength intended for use as an inner wrap. Type 2 is a woven glass fiber scrim coated with bitumen; it has high tensile strength in the longitudinal and transverse directions with low binder holding capacity, and is intended for use in the outer layers of the coating. Type 3 is a woven or bonded glass fiber scrim combined with random glass fiber mat for tensile strength in both directions equal to or better than Type 2, with porosity and binding capacity similar to Type 1. It may be used for both inner and outer layers of the coating. This glass fiber reinforcing material has been used internally and externally as a corrosion preventative in steel pipes for transporting water from storage dams to the areas of need. Pipes coated with bitumen only proved unsatisfactory, because bitumen was subject to physical damage in transit and by rock penetration. Heasian was once used as a reinforcing material, but this organic material eventually rotted and failed. Glass fiber reinforcing material has proved most successful. (Davison-IPA)

ENGINEERING CONSIDERATIONS IN THE USE OF ARTIFICIAL FILTER BEDS,
Burns and Roe, Inc., Paramus. Dept. of Hydraulic Engineering.
R. T. Richards.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 5-12, 5 fig, 4 ref. 1978.

Descriptors: *Environmental effects, *Engineering structures, *Entrainment, Cooling water, Fish, Powerplants, Filters, Artificial filter beds.

Preliminary engineering for an artificial filter system is discussed in connection with a proposed 1.6 cubic m/s-capacity filter in the Columbia River. Major engineering problems for filter beds are identified as development of a suitable and stable filter medium; design of a reliable backwash system which is both effective and environmentally acceptable; meeting of all site-imposed restrictions; and provision of civil and mechanical engineering design inherent in such a syste. It was concluded that the majority of future filter engineering will be site-related and will require a new design for each project. (See also W79-07080) (Chilton-ORNL)
W79-07081

HIGH-CAPACITY FILTERS FOR POWER PLANT COOLING WATER INTAKES,
Washington Univ., Seattle. Fisheries Research Inst.
Q. J. Stober.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 13-14, 1978. 4 ref.

Descriptors: *Environmental effects, *Engineering structures, Entrainment, Fish, Larvae, Filters, Models, *Impingement.

A high-capacity model filter for preventing entrainment and impingement of pelagic eggs and larval fishes as power plant intakes was tested at a proposed plant site in Puget Sound. Model filter studies, fouling control techniques and an engineering design concept were reviewed. It was concluded that, while filter intake systems could be an attractive and effective technology for the exclusion of pelagic eggs and larval fishes, the present technology is not sufficiently developed to allow reliable design and operation. (See also W79-07080) (Chilton-ORNL)
W79-07082

COOLING WATER INTAKES UTILIZING RANNEY COLLECTORS OR RANNEY INTAKES,
Ranney Method Western Corp., Kennewick, WA.
F. C. Mikels, and T. W. Bennett.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 15-25, 1978. 3 fig, 4 tab, 14 ref.

Descriptors: *Environmental effects, *Engineering structures, *Entrainment, Intakes, Powerplants, Design, Aquatic life, *Impingement.

The two types of intakes discussed in this paper are the Ranney Collector, a subsurface intake using natural sand and gravel deposits to transmit water from a surface source, and the Ranney Surface Water Intake, a submerged horizontal perforated-pipe intake. Ranney Collectors are reported to offer the best available technology for minimal environmental impact. The chief limitation of the collectors is that of hydrogeology. Ranney Collectors can be successfully installed only in areas where there are permeable sand and gravel aquifers connected hydraulically with a surface source. Ranney Surface Water Intakes are applicable to either small or large demand requirements. Intake screen openings may be of any size or shape considered to be environmentally suitable. The screens are located sufficiently far above the bottom of the stream or lake so as to have little effect on bottom-dwelling organisms. Greatest potential danger to effective and efficient long-term operation of this intake is the improper placement of screens within the streambed. (See also W79-07080) (Chilton-ORNL)
W79-07083

HYDROLOGIC ENGINEERING CONSIDERATIONS FOR RANNEY COLLECTOR WELL INTAKE SYSTEMS,
Argonne National Lab., IL. Div. of Environmental Impact Studies.
N. J. Beskid.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 27-36, 1978. 6 fig, 7 ref.

Descriptors: *Environmental effects, *Engineering structures, *Entrainment, Intakes, Powerplants, Design, Fish, Aquatic life, *Impingement.

The hydrologic parameters which govern the operation of a Ranney Collector Well and the factors that limit its installation and use are discussed. Ranney Collector Well intakes incur virtually no fish impingement or entrainment; pose no threat to navigation; and remove less water from streams during low flow than do conventional stream intakes. Groundwater is supplied by the process of induced infiltration. Problems requiring site-specif-

ic design are outlined. (See also W79-07080) (Chilton-ORNL)
W79-07084

AN ENGINEERING EVALUATION OF POROUS-DIKE INTAKE SCREENING SYSTEMS,
Worcester Polytechnic Inst. Holden, MA. Alden Research Lab.
J. C. Roberge.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 37-50, 1978. 14 fig, 2 tab, 11 ref.

Descriptors: *Environmental effects, *Engineering structures, Powerplants, Cooling water, Intakes, Filters, Entrainment, Design.

Experimental data on energy losses for various dike materials and flow conditions are presented and compared with those in available literature. Analysis is made of factors governing energy losses to indicate which parameters need further clarification and standardization. A hypothetical porous-dike installation was described and it was concluded that empirical design techniques are available and are currently being refined; the porous dike screening concept is economically competitive with other exclusion systems; and a comparison of the various screening concepts operating under carefully monitored field conditions is needed to gain a more complete understanding of their relative engineering feasibility, biological performance, and cost effectiveness. Passavant Corp., Birmingham, AL. Solids Disposal Div.
K. R. Siddle, and R. K. Sharma.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 65-68, 1978. 1 fig, 1 tab.

Descriptors: *Environmental effects, *Engineering structures, *Entrainment, Powerplants, Cooling water, Aquatic life, Intakes, Filters, Screens, Passavant screens.

Design and operation of the Passavant screen, a traveling screen in which water enters between the front and back belts and travels laterally through either, is described. Mesh size of the screening material can be selected. Screened organisms are retained in the retaining lip and are not exposed to air as the basket rotates and is washed. Screened organisms are washed into a trough and can be returned to the source water body. Screens can be rotated at high speed (28 fpm). Baskets are easily removed for replacement of screening material. (See also W79-07080) (Chilton-ORNL)

BIOLOGICAL AND ENGINEERING CONSIDERATIONS IN THE FINE-SCREENING OF SMALL ORGANISMS FROM COOLING WATER INTAKES,
Stone and Webster Engineering Corp., Boston, MA.
Y. G. Mussalli, E. P. Taft, and P. Hoffmann.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 107-123, 1978. 12 fig, 18 ref.

Descriptors: *Engineering structures, *Environmental effects, Intakes, Cooling water, Powerplants, Aquatic life, Filters, Screens, *Impingement, *Deterrents.

Biological and engineering criteria which should be considered in selecting design parameters for an intake utilizing fine screening are discussed. These criteria include site specific selection of screen type, screenwell layout, screen mesh size, mesh material, wash systems and special features for protection of organisms. Impingement and deterrent concepts are discussed. Deterrent concepts are relatively new and the need to expand research efforts in this area is pointed out. It was concluded that impingement concepts offer the most practicable solution to larval entrainment problems at once-through cooling sites while deterrent concepts are limited to closed-loop cooling systems. ENGINEERING AND HYDRAULICS OF THE MODIFIED PERFORATED-PIPE INTAKE,
Burns and Roe, Inc., Paramus, NJ. Dept. of Hydraulic Engineering.
R. T. Richards.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 141-147, 1978. 4 fig, 7 ref.

Descriptors: *Engineering structures, *Environmental effects, Intakes, Powerplants, Screens, Aquatic life, *Perforated pipe intakes.

The perforated pipe as a screening device has been used for many years in cases involving small flow volumes. The modified perforated pipe has been changed to give uniform inflow velocities and is a relatively new concept. The modified perforated-pipe intake has been model-tested and has been in place in the Columbia River for a makeup water intake serving a nuclear power plant for several months. It was concluded that the perforated-pipe intake with improvements in design is an alternative for reliable water intake and protection of aquatic life where conditions for its installation are favorable. W79-07093

THE JOHNSON SCREEN FOR COOLING WATER INTAKES,
Universal Oil Products, Inc., St. Paul, MN.
L. E. Cook.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 149-157, 1978. 12 fig, 1 tab, 3 ref.

Descriptors: *Engineering structures, *Environmental effects, Entrainment, Powerplants, Intakes, Cooling water, Aquatic life, Johnson screen.

Flow field modeling of Johnson surface-water screens is discussed and a series of case studies is presented. It was concluded that nearly uniform through screen velocities can be obtained by proper consideration of design variables. Advantages of uniform, low through-screen velocities are identified as: more efficient use of screen and lower head loss is an immediate result; probability of entrapment of aquatic organisms is reduced; need for cleaning is minimized; and the ratio of ambient current velocity to withdrawn velocity is maximized. (See also W79-07080) (Chilton-ORNL)

IN-SITU TESTING OF PROFILE WIRE SCREENS FOR LONG-TERM ENGINEERING FEASIBILITY,
Delmarva Power and Light Co., Wilmington, DE.
J. C. Miller, K. E. Charles, and T. H. Key.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 159-167, 1978. 7 fig.

Descriptors: *Engineering structures, *Environmental effects, *Fouling, Intakes, Cooling water, Powerplants, Aquatic life, Screens, Filters.

The primary objective of the in-canal test program presented was to demonstrate reliable, long-term operation of a small-slot, profile-wire screen with an operating and maintenance effort which would be acceptable in a power station installation. Test results showed that detrital clogging was significant only when the screen was heavily biofouled. Most maintenance required was due to biofouling which was heaviest from late May through early October. Average time between cleaning with high-pressure water and increase in pressure drop was 8 days. Mean times between first increase in pressure drop and first clog was 4 days; mean time between first clog and removal for cleaning was 7 days. Average time between cleanings was 19 days. No effect on rate of biofouling was observed during periods of daily backwashing tests. An air/water backwash technique appeared to be effective but required more time and effort than water backwashing. (See also W79-07080) (Chilton-ORNL)
W79-07095

LARVAL EXCLUSION SYSTEMS FOR POWER PLANT COOLING WATER INTAKES: A SYNTHESIS OF VIEWS PRESENTED AT THE WORKSHOP,
Argonne National Lab., IL. Div. of Environmental Impact Studies.
R. K. Sharma.
In: Larval Exclusion Systems for Power Plant Cooling Water Intakes, Proceedings of a Workshop, San Diego, California, February 7-8, 1978. NUREG/CP-002; ANL/ES-66. p 235-237, 1978.

Descriptors: *Engineering structures, *Environmental effects, Powerplants, Intakes, Cooling water, Aquatic life, Entrainment, Impingement.

A summary of the papers concerning various exclusion systems which were presented at the workshop is given. These include subsurface collectors, perforated pipes, profile wire, porous dikes, artificial filter beds and fine-mesh traveling screens. Recommendations of the workshop are presented. It was concluded that no sound arguments on an ecological basis can be forwarded to screen fish larval form at all power plants. A detailed comparative cost evaluation of various concepts is needed. The subsurface collector is recommended as the most effective concept for larval exclusion if geologic and hydrologic factors permit. Biological

effectiveness of several concepts is recommended. (See also W79-07080) (Chilton-ORNL)
W79-07098

TROUT FARM REQUIRES CONSTANT FLOW, GOOD QUALITY WATER,
A. Hewitson.
Canadian Water Well, Vol. 5, No. 2, p 24-25, May, 1979.

Descriptors: *Fish farming, *Water supply, *Water wells, Water quality, Agriculture, Fish hatcheries, Canada, Drilling, Solid wastes, Sludge disposal, Fertilizers, Fish, Rainbow trout, Dissolved oxygen.

The operation of a compact, commercial trout farm which raises 150,000 rainbow trout annually is described. The water supply for the farm consists of two spring-fed streams augmented by four wells with a total flow of 1600 gpm of good quality. The wells were drilled with a rotary rig to depths ranging from 24 to 42 meters. Mixing the warmer well water with the surface water extends the growing season. The level of oxygen in the water, critical to the growth and survival rate of the trout, depends primarily on water quality. The good quality of the water supply is maintained with degassers which force oxygen through the water and drive off hydrogen into the atmosphere and with a system of continuous solid waste removal. Much of the sludge from the waste disposal tank is used as an agricultural fertilizer. (Purdin-NWWA)

W79-07074 5D

An Evaluation of Non-Specific Measurements on Organic Pollutants in Waters and Wastewater,
W79-07347 5A

The Impact of Urbanization on Stream Quality,
W79-07461 5C

BIODEGRADATION
Water Column Bacteriology,
W79-07295 5C

Water Column and Benthic Microbiology-Mycology,
W79-07296 5C

Benthic Bacteriology,
W79-07297 5C

The 'Biopot' -- Good Rural Hygiene,
W79-07358 5D

BIOLOGICAL TREATMENT
Ecological Assessments for Wastewater Management in Southeastern Michigan,
W79-07041 5C

BIOLUMINESCENCE
Development of a Chemiluminescent and Bioluminescent System for the Detection of Bacteria in Wastewater Effluent,
W79-07064 5A

BIOMASS
An Ecophysiological Study of the Meiofauna of the Swartkops Estuary. 2. The Meiofauna: Composition, Distribution, Seasonal Fluctuation and Biomass,
W79-07349 2L

BIOTA
Forms of Metals in Water,
W79-07202 5G

Heavy Molecular Weight Hydrocarbons in Macroepifauna and Macronekton Samples,
W79-07292 5B

BLUE EARTH COUNTY (MINNESOTA)
Public Drainage Atlas, Blue Earth County, Minnesota,
W79-07420 2A

BLUE-GREEN ALGA
Fluorometric Studies on the Toxins of Gonyaulax Tamarensis and Aphanizomenon Flos-Aquae,
W79-07254 5A

BOREHOLES
A Borehole Probe for Sampling Groundwater from Selected Strata,
W79-07361 8C

BORON
Boron Distribution in Soils and Waters of Egypt,
W79-07230 2K

BOTTOM SAMPLING
Lake Erie Nearshore Sediments, Point Pelee to Port Burwell, Ontario,
W79-07224 2J

BOUNDARIES (SURFACES)
Combined Wave and Current Interaction with a Rough Bottom,
W79-07328 2L

BREAKWATERS
Design Criteria for Floating Tire Breakwaters,
W79-07316 2L

Koeberg Harbour Features an Impervious Breakwater,
W79-07354 8A

Floating Breakwater,
W79-07410 8A

BRINE DISPOSAL
Methane from Geopressured Aquifers Studied,
W79-07193 6B

BRISTOL CHANNEL (UK)
Isotopic Abundances of Lead in Estuarine Sediments, Swansea Bay, Bristol Channel,
W79-07148 2L

BRITISH COLUMBIA
Wastewater Generation and Disposal in Veneer and Plywood Plants in British Columbia,
W79-07214 5C

Limitations of Single Water Samples in Representing Mean Water Quality II Spatial and Temporal Variation in Nutrient Concentrations in the Okanagan River at Oliver, B.C.,
W79-07222 5G

BROWDERS CREEK (TX)
Special Flood Hazard Information: Walnut Creek, Springtown, Texas.
W79-07378 2E

BUFFALO COUNTY (NB)
Sources and Concentrations of Nitrate-Nitrogen in Ground Water of the Central Platte Region, Nebraska,
W79-07322 5B

BUILDING CODES
Flood Hazard Analyses: North Fork Rush Creek, Hennepin County, Minnesota,
W79-07381 2E

BURNTWOOD RIVER
The Churchill Diversion: Water Quality Changes in the Lower Churchill and Burntwood Rivers,
W79-07208 6D

BYPASSES
Review of Problems Within Combined and Partly Combined Sewerage Systems in the Province of Ontario.
W79-07210 2E

CADMIUM
Water Quality Degradation Due to Non-Point Pollution Input from Urban Sources,
W79-07421 5B

CALCITE
Occurrence and Stability of Calcite in the Maumee River,
W79-07158 2K

CALIFORNIA
Observations on the Geochemistry of Soluble Copper, Iron, Nickel, and Zinc in the San Francisco Bay Estuary,
W79-07144 5A

History, Politics and the Law of the California Tidelands Trust,
W79-07243 6E

Public Beaches: A Reevaluation,
W79-07249 6E

CANADA
Organic Carbon Isotope Ratios in Recent Sediments in the St. Lawrence Estuary and the Gulf of St. Lawrence,
W79-07150 2L

Accumulation of Polychlorinated Biphenyls (PCBs) in Surficial Lake Superior Sediments. Atmospheric Deposition,
W79-07332 5B

Combined Influence of Inflow and Lake Temperatures on Spring Circulation in a Riverine Lake,
W79-07336 2H

CANBERRA
Simulation of the Urban Runoff Process,
W79-07376 6A

CANDIDA ALBICANS
Occurrence and Significance of Candida Albicans in Lake Ontario Bathing Beaches,
W79-07207 5C

CAPILLARY ACTION
Experimental Investigation of the Penetration Coefficient in Capillary Tubes,
W79-07317 2G

CAPILLARY CONDUCTIVITY
Experimental Investigation of the Penetration Coefficient in Capillary Tubes,
W79-07317 2G

CARBON DIOXIDE
Effects of Increases in Carbon Dioxide in the Earth's Atmosphere - A Synthesis,
W79-07371 5C

CARBON FILTERS
Evaluation of Physical Chemical Treatment at Rosemount,
W79-07037 5D

CARP
Induced Spawning of the Two Phytophagous Chinese Carp Species Ctenopharyngodon Idella (Val.) and Hypopthalmichthys Molitrix (Val.) with Reference to the Possible Use of the Grass Carp in the Control of Aquatic Weeds,
W79-07362 5G

CATCHMENT AREAS
Calculation of Instantaneous Unit Hydrographs in an Urban Area,
W79-07442 2A

The Effect of Urbanization on Storm Runoff from Two Catchment Areas in North London,
W79-07443 2E

CATCHMENTS
Runoff Control on Urbanizing Catchments,
W79-07444 2A

CENSUS
National Inventory of Municipal Waterworks and Wastewater Systems in Canada 1977.
W79-07211 7B

CENTRAL LEA COUNTY (N MEX)
Ground-Water Depletion, In Feet, Allowed in Central Lea County, New Mexico, by U.S. Internal Revenue Service for Calendar Year 1978,
W79-07015 6C

CENTRIFUGATION
Pilot Plant Investigations of Secondary Sludge Dewatering Alternatives,
W79-07073 5D

CHAMBERS COUNTY
Water Availability, Chambers County, Alabama,
W79-07023 7C

CHANNEL BEDS
The Convergence of Implicit Bed Transient Models,
W79-07107 8B

CHANNEL CATFISH
Study of the Cumulative Growth-Inhibiting Factors in Recycled Water for Catfish Cultivation,
W79-07366 5C

CHANNEL FLOW
Grand Coulee Third Powerplant, Degradation Study,
W79-07369 2E

CHANNEL MORPHOLOGY
Grand Coulee Third Powerplant, Degradation Study,
W79-07369 2E

CHANNELS
Grand Coulee Third Powerplant, Degradation Study,
W79-07369 2E

CHEMICAL ANALYSIS
Development of a Chemiluminescent and Bioluminescent System for the Detection of Bacteria in Wastewater Effluent,
W79-07064 5A

Wastewater Sampling Methodologies and Flow Measurement Techniques,
W79-07076 7A

Eutrophication of Four Transvaal Dams,
W79-07364 5C

Microsubstances in Urban Storm Water,
W79-07453 5A

CHEMICAL DEGRADATION
Self-Container Sanitation Systems for 2- to 15-Man Polar Facilities,
W79-07042 5D

CHEMICAL PRECIPITATION
Phosphorus Removal from Human Wastewater by Direct Dosing of Alum to a Septic Tank,
W79-07062 5D

Investigation into the Application of Physico-Chemical Processes for Municipal Waste-Water Treatment (Onderzoek Naar de Toepassingsmogelijkheden van Fysisch-Chemische Processen Voor de Zuivering van Huishoudelijk Afvalwater),
W79-07071 5D

Occurrence and Stability of Calcite in the Maumee River,
W79-07158 2K

CHEMICAL PROPERTIES
An Ecophysiological Study of the Meiofauna of the Swartkops Estuary. 1. The Sampling Sites: Physical and Chemical Features,
W79-07348 2L

Estimation of the Changes in the Chemical Composition of Surface Water in Urban Areas,
W79-07462 5B

CHEMICAL REACTIONS
Development of a Chemiluminescent and Bioluminescent System for the Detection of Bacteria in Wastewater Effluent,
W79-07064 5A

CHEMICAL WASTES
An Evaluation of Non-Specific Measurements on Organic Pollutants in Waters and Wastewater,
W79-07347 5A

CHEMICALS
Self-Container Sanitation Systems for 2- to 15-Man Polar Facilities,
W79-07042 5D

CHESAPEAKE BAY
Subtidal Sea Level Variations in the Chesapeake Bay and Relations to Atmospheric Forcing,
W79-07139 2L

Environmental Poly(Organosiloxanes) (Silicones),
W79-07333 2L

CHEYENNE RIVER BASIN (SD)
Comprehensive Water Quality Management for the State of South Dakota. 303(e) Basin Plan for the Cheyenne River Basin 08SD0700,
W79-07382 5G

CHLORINATION
Application of the ATP Assay for Monitoring the Disinfection of Wastewater Streams,
W79-07203 5D

Unnecessary and Harmful Levels of Domestic Sewage Chlorination Should Be Stopped,
W79-07262 6E

CHLOROPHYLL
Phytoplankton and Productivity,
W79-07299 5C

CHURCHILL RIVER
The Churchill Diversion: Water Quality Changes in the Lower Churchill and Burntwood Rivers,
W79-07208 6D

CILIATED PROTOZOA
Ciliated Protozoa,
W79-07301 5C

CIRCULATION
Combined Influence of Inflow and Lake Temperatures on Spring Circulation in a Riverine Lake,
W79-07336 2H

CITIES
National Inventory of Municipal Waterworks and Wastewater Systems in Canada 1977.
W79-07211 7B

A Study of Stormwater Runoff Quality,
W79-07321 5A

CIVIL ENGINEERING
Influence of Civil Engineering Projects on Water Quality in Deltaic Regions,
W79-07465 5C

CLARENCE CANNON DAM (MO)
Clarence Cannon Dam and Reservoir: Cost, Schedule, and Safety Problems. Corps of Engineers (Civil Functions) Department of the Army,
W79-07383 6B

CLAYS
The Fractionation of Clay Sized Particles from the Wuras Dam Water Phase,
W79-07190 5A

CLEANING
Effluent Water Quality Discharged from Three Oyster Shellstock Washers,
W79-07003 5A

CLOSED WATER-USE CYCLES
Closed Water-Use Cycles in Urban Industrial Communities,
W79-07475 5D

CLOUD SEEDING
Final Environmental Statement: Project Skywater, A Program in Precipitation Management, Volume I.
W79-07489 3B

Final Environmental Statement: Project Skywater, A Program in Precipitation Management, Volume II, Appendices A-J.
W79-07490 3B

COAGULATION
Investigation into the Application of Physico-Chemical Processes for Municipal Waste-Water Treatment (Onderzoek Naar de Toepassingsmogelijkheden van Fysisch-Chemische Processen Voor de Zuivering van Huishoudelijk Afvalwater),
W79-07071 5D

COALS
Wastewater Filtration Design Considerations,
W79-07077 5D

COASTAL ENGINEERING
Design Criteria for Floating Tire Breakwaters,
W79-07316 2L

COASTAL MARSHES
Local Environmental Management-Can it Work. A Case Study of the Virginia Wetlands Act,
W79-07281 7B

COASTAL PLAINS
Joint Occurrences in Coastal Flooding,
W79-07164 2L

Inland Boundary Determinations for Coastal Management Purposes - An Ecological Systems Approach to Requirements of the Federal Coastal Zone Management Act of 1972,

PERMITS
Industrial Siting: Allocating the Burden of Pollution,
W79-07244 6E

State Program Elements Necessary for Participation in the National Pollutant Discharge Elimination System,
W79-07265 6E

PERTH (WESTERN AUSTRALIA)
The Movement and Changes in Concentration of Contaminants Below a Sanitary Landfill, Perth, Western Australia,
W79-07468 5A

PESTICIDE KINETICS
Predicting Phosphorus Movement and Pesticide Action in Salt Marshes with Microecosystems,
W79-07006 5B

PESTICIDES
Herbicide Runoff from Upland Piedmont Watersheds--Data and Implications for Modeling Pesticide Transport,
W79-07154 5A

Fertilizers and Pesticides in Runoff and Sediment from Claypan Soil,
W79-07422 5G

PHILADELPHIA (PA)
Sources and Movement of Organic Chemicals in the Delaware River,
W79-07331 5B

PHOENIX (AZ)
Waste Water Reuse in Phoenix--How Viable Is It,
W79-07118 3C

PHOSPHATE
Fertilizers and Pesticides in Runoff and Sediment from Claypan Soil,
W79-07422 5G

PHOSPHOROUS
Predicting Phosphorus Movement and Pesticide Action in Salt Marshes with Microecosystems,
W79-07006 5B

PHOSPHORUS
Phosphorus Removal from Human Wastewater by Direct Dosing of Alum to a Septic Tank,
W79-07062 5D

Response of Haley Pond, Maine, to Changes in Effluent Loads,
W79-07147 5D

Effects of Urbanization on Phosphorus Flows in a Residential System,
W79-07433 5B

Phosphorus Supplying Capacities of Previously Heavily Fertilized Soils,
W79-07492 2K

PHOTOSYNTHESIS
14C Assimilation in a Turbid Man-Made Lake,
W79-07178 2J

PHYSICAL PROPERTIES
An Ecophysiological Study of the Meiofauna of the Swartkops Estuary. 1. The Sampling Sites: Physical and Chemical Features,
W79-07348 2L

PHYTOPLANKTON
Phytoplankton and Productivity,
W79-07299 5C

PILOT PLANTS
Overland Flow in the Louisiana Coastal Zone; The Potential for Land Treatment of Waste Water on Diked Dredged Spoil Disposal Sites in South Louisiana,
W79-07065 5D

Treatment of Base Metal Mine Drainage at Pilot Scale,
W79-07220 5D

PIPE FLOW
Multiple Operating Points in Complex Pump Networks,
W79-07228 8B

PLANKTON
Ciliated Protozoa,
W79-07301 5C

PLANNING
Hydrologic Modeling and Data Requirements for Analysis of Urban Streamflow Management Alternatives,
W79-07004 6A

Waste Water Reuse in Phoenix--How Viable Is It,
W79-07118 3C

The Okavango Delta: Planning for the Future,
W79-07176 6B

Coastal Land Management: An Introduction,
W79-07277 6E

When Water is Threatened,
W79-07345 5D

Water, Water: Editorial Comment,
W79-07352 4A

The Relations Between Water Management and Physical Planning in Poland for Urbanized Areas,
W79-07486 4C

Final Environmental Statement: Project Skywater, A Program in Precipitation Management, Volume III, Appendix K.
W79-07491 3B

PLANT PATHOGENS
Pollution of Irrigation Reuse Water by Plant Pathogens,
W79-07393 3C

PLANT PHYSIOLOGY
Plant Physiological Responses to Water Stress,
W79-07170 3F

PLANT POPULATION
The Effect of Agitation and Turbulence of the Growth Medium on the Growth and Viability of Microcystis,
W79-07188 2H

PLATE COUNT TESTS
Application of the ATP Assay for Monitoring the Disinfection of Wastewater Streams,
W79-07203 5D

POINT PELEE
Lake Erie Nearshore Sediments, Point Pelee to Port Burwell, Ontario,
W79-07224 2J

POLAND
The Relations Between Water Management and Physical Planning in Poland for Urbanized Areas,
W79-07486 4C

POLDERS
Sources of Eutrophication in the Western Netherlands as Illustrated for Three Polders,
W79-07464 5B

POLITICAL ASPECTS
Hightide - A Coastal Commissioner's Perspective: Choosing Between What the Law Says and What the Law Allows,
W79-07282 6E

POLITICAL CONSTRAINTS
Port State Jurisdiction over Vessel - Source Marine Pollution,
W79-07278 6E

POLLUTANT ENTRY
Methods of Forecasting the Entry of Pollutants into Urban Water Bodies,
W79-07466 5B

POLLUTANT IDENTIFICATION
The Alsterberg (AZID) Modification of the Winkler Method for the Determination of the BOD of Incinerator Quench Water and the Calibration of the Weston and Stack DO Analyzer Model 300-B,
W79-07034 5A

The Invertibrate Fauna and Biotic Index Value of Water Quality of the Great Berg River, Western Cape,
W79-07182 5A

An Evaluation of Non-Specific Measurements on Organic Pollutants in Waters and Wastewater,
W79-07347 5A

Apparatus and Method for Analyzing Oil Content of Water,
W79-07418 5A

POLLUTANT SOURCES
Urban Storm Water Pollutant Sources,
W79-07430 5B

POLLUTANTS
Changes in Concentrations of Selected Chemical Pollutants in Wet, Tile-Drained Soil Systems as Influenced by Disposal of Septic Tank Effluents,
W79-07157 5C

Levels of Ammonium, Sulfate, Chloride, Calcium, and Sodium in Snow and Ice from Southern Greenland,
W79-07329 5B

Pollution History of the Savannah River Estuary,
W79-07330 2L

Accumulation of Polychlorinated Biphenyls (PCBs) in Surficial Lake Superior Sediments. Atmospheric Deposition,
W79-07332 5B

Environmental Poly(Organosiloxanes) (Silicones),
W79-07333 2L

Mobility of Pollutants in Soil and Groundwater Near Waste Disposal Sites,
W79-07469 5B

POLLUTION ABATEMENT
Water Quality Standards,
W79-07239 6E

Water Quality Standards for Navigable Waters of Alabama,
W79-07241 6E

Agricultural Non-Point Source Water Pollution control under Sections 208 and 303 of the Clean Water Act: Has Forty Years of Experience Taught us Anything,
W79-07248 6E

Tioga River Mine Drainage Abatement Project,
W79-07368 5D

Catch Basin Interceptor,
W79-07401 2E

POLYCHLORINATED BIPHENYLS
Accumulation of Polychlorinated Biphenyls (PCBs) in Surficial Lake Superior Sediments. Atmospheric Deposition,
W79-07332 5B

POLYETHYLENE LYSIMETERS
Leachability of Radioactive Constituents from Uranium Mine Tailings Status Report (June, 1974 to January, 1977),
W79-07201 5D

POLYMERS
Environmental Poly(Organosiloxanes) (Silicones),
W79-07333 2L

PONDING
Ponding-Test Procedure for Assessing the Infiltration Capacity of Storm-Water Basins, Nassau County, New York,
W79-07012 4B

PONDS
Model Studies Aid Pond Design,
W79-07313 2J

PONGOLO RIVER (SOUTH AFRICA)
On the Dissolved Solids of the Pongolo Flood Plain Pans,
W79-07187 4A

POROUS MEDIA
Dissolution and Transport of Gypsum in Soils: I. Theory,
W79-07285 2G

A New Numerical Solution of Unsteady Two-Dimensional Flow in Unsaturated Porous Media,
W79-07318 2G

PORT AUTHORITIES
Port State Jurisdiction over Vessel - Source Marine Pollution,
W79-07278 6E

PORT BURWELL
Lake Erie Nearshore Sediments, Point Pelee to Port Burwell, Ontario,
W79-07224 2J

POTABLE WATER
How to Cope with the Safe Drinking Act,
W79-07264 6E

POTOMAC RIVER
Environmental Poly(Organosiloxanes) (Silicones),
W79-07333 2L

POULTRY
Nitrate and Ammonium Concentrations of Ground Water Resulting from Poultry Manure Applications,
W79-07156 5C

Disinfection of Poultry Packing Plant Effluents Salmonella.
W79-07215 5D

POWER PLANTS
Insufficient Eis Halts Hydro-Electric Project,
W79-07279 6E

POWERPLANTS
Koeberg Harbour Features an Impervious Breakwater,
W79-07354 8A

PRECIPITATION
Statistical Evidence of the Influence of Urbanization on Precipitation in the Rijnmond Area,
W79-07429 2B

Flood Waves from Impervious Areas,
W79-07439 2E

PRECIPITATION (ATMOSPHERIC)
Aluminum Leaching Response to Acid Precipitation: Effects on High-Elevation Watersheds in the Northeast,
W79-07103 2K

Characteristics of Oklahoma Hailfalls and Hailstorms,
W79-07138 2B

A Technique for the Determination of Areal Average Rainfall,
W79-07310 2B

Acid Rain: Neutralization Within the Hubbard Brook Ecosystem and Regional Implications,
W79-07311 5B

PRICING
Water Conservation Via a Variable Pricing Mechanism,
W79-07449 6C

PRIMARY PRODUCTIVITY
Epibenthic Algal Production in the Swartkops Estuary,
W79-07351 2L

PRINCIPAL COMPONENT ANALYSIS
Heavy Metals in Water, Suspended Matter and Sediment,
W79-07463 5A

PRIORITIES
Wetland Protection in Compliance with NEPA,
W79-07238 6E

PROBABILITY
Joint Occurrences in Coastal Flooding,
W79-07164 2L

PRODUCTIVITY
Phytoplankton and Productivity,
W79-07299 5C

PROJECT PLANNING
Wastewater Engineering and Management Plan for Boston Harbor - Eastern Massachusetts Metropolitan Area Emma Study, Vol. 6. Formulation of Wastewater Utilization Plan,
W79-07044 5D

Water, Water: Editorial Comment,
W79-07352 4A

Proceedings, North Carolina 208 Problem Assessment Workshop, May 4, 1977, Raleigh,
W79-07391 6B

PROJECTS
Influence of Civil Engineering Projects on Water Quality in Deltaic Regions,
W79-07465 5C

PROTECTION
Strengthening State Wetland Regulations,
W79-07259 6E

Controlled Recharge of Waste Water for Aquifer Protection and Production of Renovated Water,
W79-07474 5G

PROTECTIVE COATINGS
Glass Fibre Protection for our Life Lines,
W79-07359 8G

PROTOZOA
Ciliated Protozoa,
W79-07301 5C

PROTRADE METHOD
Multiple Objectives Under Uncertainty: An Illustrative Application of Protrade,
W79-07100 6A

PRUDHOE (AL)
Mapping of Sea Ice and Measurement of Its Drift Using Aircraft Synthetic Aperture Radar Images,
W79-07327 7B

PUBLIC ACCESS
Public Beaches: A Reevaluation,
W79-07249 6E

Public Access to the Oceanfront Beaches - A Report to the Governor and Legislature of New Jersey (Public Access to the New Jersey Oceanfront Beaches),
W79-07261 6E

Public Access to the Shoreline: The Rhode Island Example,
W79-07283 6E

PUBLIC HEALTH
Recovery of Viruses from the Missouri River,
W79-07031 5B

PUBLIC RIGHTS
The Public Trust Doctrine in North Dakota,
W79-07271 6E

Public Access to the Shoreline: The Rhode Island Example,
W79-07283 6E

PUBLICATIONS
Viruses in Waste, Renovated and Other Waters. 1973 Literature Abstracts.
W79-07057 5B

PULP AND PAPER INDUSTRY
Wood Driving Operations in Sweden and Finland.
W79-07218 4C

PULP WASTES
Pilot Plant Investigations of Secondary Sludge Dewatering Alternatives,
W79-07073 5D

PUMPED STORAGE
Drakensberg Scheme in Full Swing,
W79-07353 8A

Influence of Pumped Storage Flows on Thermal Stratification in Reservoirs,
W79-07365 8B

PUMPING
Multiple Operating Points in Complex Pump Networks,
W79-07228 8B

PUMPING PLANTS
Drakensberg Scheme in Full Swing,
W79-07353 8A

PUMPS
A Borehole Probe for Sampling Groundwater from Selected Strata,
W79-07361 8C

QUENCHING
The Alsterberg (AZID) Modification of the Winkler Method for the Determination of the BOD of Incinerator Quench Water and the Calibration of the Weston and Stack DO Analyzer Model 300-B,
W79-07034 5A

QUESTIONNAIRES
National Inventory of Municipal Waterworks and Wastewater Systems in Canada 1977.
W79-07211 7B

RADIOACTIVE WASTE DISPOSALS
An Appraisal of Underground Radioactive Waste Disposal in Argillaceous and Crystalline Rocks: Some Geochemical, Geomechanical and Hydrogeological Questions,
W79-07196 5E

RADIOACTIVITY
Lead-210 Chronology in Relation to Levels of Elements in Dated Sediment Core Profiles,
W79-07149 2L

RAINFALL
Rainfall Additaments to Subsurface Water in a Young Pine Plantation,
W79-07117 2I

A Technique for the Determination of Areal Average Rainfall,
W79-07310 2B

Some Aspects of the Effects of Urban Development on Thunderstorms in the Southeast Coastal Plain of Georgia, USA,
W79-07427 2B

Urban Effects on Storm Rainfall in Midwestern United States,
W79-07428 2B

Some Qualitative and Quantitative Aspects of Surface Water in an Urban Area with Separate Storm Water and Waste Water Sewer Systems,
W79-07441 2A

RAINFALL-RUNOFF RELATIONSHIPS
Calculation of Instantaneous Unit Hydrographs in an Urban Area,
W79-07442 2A

RAINFALL SIMULATORS
Multiple-Intensity Rainfall Simulator for Erosion Research on Row Sideslopes,
W79-07146 2J

RANCE POWER STATION (FRANCE)
The Rance Power Station,
W79-07344 8C

REAL-TIME CONTROL
Mathematical Model System for Continuous Operational Control of River Flow and Salt Concentration in an Industrialized River Basin,
W79-07447 6A

RECHARGE
Controlled Recharge of Waste Water for Aquifer Protection and Production of Renovated Water,
W79-07474 5G

RECREATION DEMAND
Economic Value of Benefits from Recreation at High Mountain Reservoirs,
W79-07128 6B

Concepts of Value for Water-Based Recreation Opportunities,
W79-07227 6B

RECREATIONAL FACILITIES
Measuring Preferences for Natural Landscapes,
W79-07125 6F

RECYCLING
Total Recycle Systems for Petrochemical Waste Brines Containing Refractory Contaminants,
W79-07048 5D

Closed Water-Use Cycles in Urban Industrial Communities,
W79-07475 5D

RED CEDAR RIVER BASIN (WIS)
Red Cedar River Basin, Wisconsin: Low-Flow Characteristics,
W79-07013 2E

RED RIVER OF THE NORTH RIVER BASIN (SD)
Comprehensive Water Quality Management for the State of South Dakota: 303(e) Basin Plan for the Red River of the North River Basin,
W79-07380 5G

REFRIGERATION
Underground Refrigeration Practice: Comparing the Water Sources,
W79-07357 3C

REGIONAL ANALYSIS
Advantages and Disadvantages of Regional Sewerage Systems,
W79-07101 5D

Location of Municipal Well Fields in an Environmentally Sensitive Region,
W79-07116 2F

REGIONAL FLOOD
Special Flood Hazard Information Report: Deer Creek, Glenrock, Wyoming.
W79-07374 2E

Flood Hazard Analyses: North Fork Rush Creek, Hennepin County, Minnesota,
W79-07381 2E

REGIONAL PLANNING
Comprehensive Water Quality Management for the State of South Dakota: 303(e) Basin Plan for the Red River of the North River Basin,
W79-07380 5G

Comprehensive Water Quality Management for the State of South Dakota. 303(e) Basin Plan for the Cheyenne River Basin 08SD0700,
W79-07382 5G

REGIONAL SOURCES
Water Supply as a Limiting Factor in Developing Communities: Local Versus Regional Sources,
W79-07483 4C

REGIONS
Influence of Civil Engineering Projects on Water Quality in Deltaic Regions,
W79-07465 5C

REGRESSION ANALYSIS
Red Cedar River Basin, Wisconsin: Low-Flow Characteristics,
W79-07013 2E

Low-Flow Characteristics of Streams in the Trempealeau-Black River Basin, Wisconsin,
W79-07019 2E

REGULATION
Pretreatment Regulations for Existing and New Sources of Pollution,
W79-07231 6E

Financial Responsibility for Water Pollution,
W79-07237 6E

Wetland Protection in Compliance with NEPA,

Water Quality Standards for Navigable Waters of Alabama,
W79-07241 6E

Strengthening State Wetland Regulations,
W79-07259 6E

Implementation of Executive Order 11988 on Floodplain Management,
W79-07267 6E

Water Use Regulation in Colorado: The Constitutional Limitations,
W79-07273 6E

REGULATIONS
Thoughts on the Role of Penalties in the Enforcement of the Clean Air and Clean Water Acts,
W79-07245 6E

REHABILITATION
Guidance for Sewer System Evaluation,
W79-07035 6B

REINFORCEMENTS
Glass Fibre Protection for our Life Lines,
W79-07359 8G

REMOTE SENSING
Accuracy of Impervious Area Values Estimated Using Remotely Sensed Data,
W79-07119 7B

Acoustical Estimation of Zooplankton Populations,
W79-07120 2H

Mapping of Sea Ice and Measurement of Its Drift Using Aircraft Synthetic Aperture Radar Images,
W79-07327 7B

REPRODUCTION
Reproductive Cycle, Histological-Histopathological Survey of Gonadal Tissue and Karyotype Analysis of Selected Species of Macroepifauna and Demersal Fishes,
W79-07309 5C

RESEARCH AND DEVELOPMENT
Final Environmental Statement: Project Skywater, A Program in Precipitation Management, Volume III, Appendix K.
W79-07491 3B

RESEARCH EQUIPMENT
Lightweight Corer Designed for Sampling Very Soft Sediments,
W79-07134 2J

Multiple-Intensity Rainfall Simulator for Erosion Research on Row Sideslopes,
W79-07146 2J

RESERVOIR SILTING
Model Studies Aid Pond Design,
W79-07313 2J

RESERVOIRS
Dissolved Oxygen Model of a Short Detention Time Reservoir with Anaerobic Hypolimnion,
W79-07121 2H

Economic Value of Benefits from Recreation at High Mountain Reservoirs,
W79-07128 6B

Mathematical Model System for Continuous Operational Control of River Flow and Salt Concentration in an Industrialized River Basin,
W79-07447 6A

RESIDENTIAL SYSTEM
Effects of Urbanization on Phosphorus Flows in a Residential System,
W79-07433 5B

RESIDUE REMOVAL
Crop Residue, Soil Erosion, and Plant Nutrient Relationships,
W79-07337 2J

RESOURCES DEVELOPMENT
Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume I,

The Characterization of Particulate Solids and Quality of Water Discharged from an Urban Catchment,
W79-07456 5A

RUNOFF COEFFICIENTS
Some Qualitative and Quantitative Aspects of Surface Water in an Urban Area with Separate Storm Water and Waste Water Sewer Systems,
W79-07441 2A

RUNOFF CONTROL
Runoff Control on Urbanizing Catchments,
W79-07444 2A

RURAL AREAS
The Effects of an Urban Area on the Water Management of a Rural Area,
W79-07434 4A

RUSH CREEK (MN)
Flood Hazard Analyses: North Fork Rush Creek, Hennepin County, Minnesota,
W79-07381 2E

SAFETY
Preventative Maintenance: Your Most Important Investment.
W79-07498 8C

SAGINAW BAY (MICHIGAN)
Results of a Joint U.S.A./U.S.S.R. Hydrodynamic and Transport Modeling Project,
W79-07367 2A

SALINE WATER
Effects of Urbanization on the Distribution of Fresh and Saline Groundwater in the Netherlands,
W79-07480 4C

SALINE WATER-FRESHWATER INTERFACES
Salinity Intrusion and Gravitational Circulation in Partially Stratified Estuaries,
W79-07131 2L

SALINE WATER INTRUSION
Salinity Intrusion and Gravitational Circulation in Partially Stratified Estuaries,
W79-07131 2L

SALMONELLA
Disinfection of Poultry Packing Plant Effluents Salmonella.
W79-07215 5D

SALMONIDS
Nitrate Removal in Closed-System Aquaculture by Columnar Denitrification,
W79-07072 5D

SALT CONCENTRATION
Mathematical Model System for Continuous Operational Control of River Flow and Salt Concentration in an Industrialized River Basin,
W79-07447 6A

SALT MARSHES
Predicting Phosphorus Movement and Pesticide Action in Salt Marshes with Microecosystems,
W79-07006 5B

SALT RIVER (AZ)
Waste Water Reuse in Phoenix--How Viable Is It,
W79-07118 3C

SAMPLING
Wastewater Sampling Methodologies and Flow Measurement Techniques,
W79-07076 7A

Lightweight Corer Designed for Sampling Very Soft Sediments,
W79-07134 2J

A Simple Floating Mean Concentration Sampler,
W79-07217 5A

An Ecophysiological Study of the Meiofauna of the Swartkops Estuary. 1. The Sampling Sites: Physical and Chemical Features,
W79-07348 2L

Better Guidance and Controls are Needed to Improve Federal Surveys of Attitudes and Opinions.
W79-07377 7A

SAN FRANCISCO BAY
Observations on the Geochemistry of Soluble Copper, Iron, Nickel, and Zinc in the San Francisco Bay Estuary,
W79-07144 5A

SAND PITS
Hydrological Setting and Water Quality of the Urban Artificial Sandpit Lake 'Sloterplas' at Amsterdam,
W79-07460 2H

SAND WAVES
Steepness of Sedimentary Dunes,
W79-07109 2J

SANDS
Septic Tank - Sand Filter Systems for Treatment of Domestic Sewage,
W79-07055 5D

Wastewater Filtration Design Considerations,
W79-07077 5D

Address of the Retiring President of the International Association of Sedimentologists: Differences in Size Distributions of Populations of Particles Among Sands of Various Origins,
W79-07152 2J

SANTA CATHERINA (ISRAEL)
Locating Ground Water in the Santa Catherina Area Using Geophysical Methods,
W79-07325 2F

SATURATED FLOW
Calculation of Saturated Hydraulic Conductivity of Some Pedal Clay Soils Using Micromorphometric Data,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

- 1 NATURE OF WATER
- 2 WATER CYCLE
- 3 WATER SUPPLY AUGMENTATION AND CONSERVATION
- 4 WATER QUANTITY MANAGEMENT AND CONTROL
- 5 WATER QUALITY MANAGEMENT AND PROTECTION
- 6 WATER RESOURCES PLANNING
- 7 RESOURCES DATA
- 8 ENGINEERING WORKS
- 9 MANPOWER, GRANTS, AND FACILITIES
- 10 SCIENTIFIC AND TECHNICAL INFORMATION

SELECTED WATER RESOURCES ABSTRACTS

The Library of the
University of Illinois
at Urbana Champaign

VOLUME 12, NUMBER 16
AUGUST 15, 1979

W79-07501 -- W79-08000
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 12, NUMBER 16
AUGUST 15, 1979

W79-07501 -- W79-08000

he Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the ansaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

A STATISTICAL VIEW OF A CLASS OF WATER QUALITY INDICES,
Geological Survey, Reston, VA. Water Resources Div.
J. M. Landwehr.
Water Resources Research, Vol. 15, No. 2, p 460-468, April 1979. 10 fig, 2 tab, 26 ref.

Descriptors: *Water quality, *Indexing, *Statistical methods, Methodology, Water types, Water chemistry, *Water quality indices.

Water quality indices are treated as random variables; the class of quality 'averaging' indices is examined and several statistics are derived. The probability density functions of the water quality constituents and the structure of the transform functions (rating curves) influence the ability of indices to measure policy performance. (Woodard-USGS)

THE DEPENDENCE OF DEWATERING PROCESS ON AQUEOUS PROPERTIES OF SLUDGES,
Vsesoyuznyi Nauchno-Issledovatelskii Inst. Vodosnabzheniya, Kanalizatsii, Gidrotekhnicheskikh Sooruzhenii i Inzhenernoi Gidro-geologii, Gostroy (USSR).
L. G. Pirogov.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 144-147, 1975. 6 tab.

Descriptors: *Dewatering, *Equations, *Sludge, *Physical properties, Osmosis, Filtration.

An investigation of the dependence of dewatering on the aqueous properties of sludges was carried out using the works of P. A. Rebinder, A. V. Likov, and M. P. Kazansky. Osmotically combined water was separated into two types: osmotic proper and entrapped water. When entrapped water is included in the Rebinder classification category, a uniform method for the calculation of physical constants related to water balance, structural and filtration characteristics, and sludge thickening, was developed. Equations and actual calculated values are presented for these physical characteristics. (See also W79-07825) (Small-FRC)

SPRINGS OF FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.; and Florida Bureau of Geology, Tallahassee.
J. C. Rosenau, G. L. Faulkner, C. W. Hendry, Jr., and R. W. Hull.
Florida Bureau of Geology Bulletin No 31 (revised), 1977. 461 p, 31 fig, 7 tab, 91 ref.

Descriptors: *Florida, *Springs, *Discharge(Water), *Spring waters, *Water quality, Artesian wells, Water utilization, Recreation, Scuba diving, Aquifer characteristics, Hot springs, Thermal water, Geohydrologic units, Karst, Caves, Submarine springs, Limestones, Aerial photography, Data storage and retrieval, *Springs inventory.

Florida's 27 first magnitude springs discharge more than 6 billion gallons per day from Tertiary limestone of the Floridan aquifer. Based on an inventory of about 300 springs, estimated total ground water discharge from Florida's springs averages 8 billion gallons per day, or more than twice the amount of fresh ground water pumped in Florida in 1975. The major use of the springs is recreational. Neither use nor spring flow has changed significantly in the past 30 years. A few springs in the populous southern part of the State no longer flow, or their flows have been reduced, owing to increased water use. Florida's springs are concentrated along the major streams and west coast. There are many submarine and some pseudosprings. At least 50 springs are known along the Suwannee River and its tributaries, of which 9 are first magnitude springs having average flows of more than 65 million gallons per day. The report describes the springs, their water quality, and flow rates. Photographs and maps are included and each spring is located geographically and by latitude and longitude. (Woodard-USGS)

EVOLUTION AND TESTING OF A FIVE-DAY WATER YIELD MODEL,
Clemson Univ., SC. Dept. of Agricultural Engineering.
T. V. Wilson, J. T. Ligon, and A. G. Law.
Transactions of the American Society of Agricultural Engineers, Vol. 22, No. 2, p 298-303, March-April 1979. 11 fig, 4 tab, 5 ref.

Descriptors: *Water yield, *Watersheds(Basins), *Model studies, *Mathematical models, Runoff, Precipitation(Atmospheric), Rainfall-runoff relationships, Hydrographs, Flow, Analytical techniques, Hydrology, Parameters.

The water yield model developed at the Southeast Watershed Laboratory was used on 10 watersheds representing 3 physiographic provinces in an effort to test its adaptability to different watershed characteristics. In each case, the analysis mode was used to obtain optimized values for the 11 parameters using 5-day values of precipitation and runoff. For one watershed, each parameter (a group of 5 in one case) was varied individually through a range of 1/4 to 4 times its converged value to study the influence of single parameter variation. This process indicated that 1/2 to 2 times the converged parameters do not drastically alter the results of prediction. Some attempts were made to determine parameter differences on watersheds of different physiographic regions, but an insufficient number of watersheds was used to effectively relate physical watershed characteristics with parameters. Water yield predictions using converged parameters and averaged parameters (across 12 four-year watershed-periods) were made, plotted, and compared. Simulation results were good with converged parameters; peaks, recessions, low flows, and total yields matched well. With averaged parameters, total 4-year yields ranged from 69.6 to 127.8% observed flow. Peaks, recessions, and low flow were not as well matched, although qualitatively the shape of the hydrgraph was well reproduced. (Sims-ISWS)

SIMULATION OF ARID RANGELAND WATERSHED HYDROLOGY WITH THE USDAHL-74 MODEL,
Science and Education Administration, Boise, ID. Northwest Watershed Center.
C. L. Hanson.
Transactions of the American Society of Agricultural Engineers, Vol. 22, No. 2, p 304-309, March-April 1979. 7 fig, 4 tab, 9 ref.

Descriptors: *Soil water, *Runoff, *Model studies, *Mathematical models, *Idaho, Ranges, Arid lands, Arid climates, Precipitation(Atmospheric), Rainfall, Snowfall, Snowmelt, Infiltration, Soils, Geology, Land use, Grazing, Vegetation, Watersheds(Basins), Hydrology.

The USDAHL-74 revised model of watershed hydrology was evaluated on an 83-ha arid rangeland watershed in southwest Idaho. The model simulated soil water adequately, except during periods in late summer and fall. Simulated runoff indicated that the model responded primarily to precipitation intensity; however, measured watershed runoff responded primarily to precipitation amount and not as much to intensity. HYDROLOGIC EFFECTS OF BRUSH CONTROL ON TEXAS RANGELANDS,
Science and Education Administration, Temple, TX.
C. W. Richardson, E. Burnett, and R. W. Bovey.
Transactions of the American Society of Agricultural Engineers, Vol. 22, No. 2, p 315-319, March-April 1979. 3 fig, 3 tab, 8 ref.

Descriptors: *Brush control, *Vegetation effects, *Runoff, *Texas, *Southwest U.S., On-site investigations, Ranges, Mesquite, Rainfall, Drainage, Effects, Soil moisture, Soil water, Watersheds(Basins), Evapotranspiration, Vegetation, Herbicides, Hydrology.

Noneconomic brushy vegetation infests millions of acres of rangeland in the Southwestern United States. This investigation was conducted to determine the hydrologic effects of controlling the brush chemically or mechanically. In the Blackland Prairie of Texas, two small watersheds infested with honey mesquite were selected for this study. The mesquite on one watershed was killed with chemicals. Killing the mesquite reduced evapotranspiration about 8 cm per yr and increased surface runoff about 10%. In the Edwards Plateau of Texas, two watersheds infested with brush were used to determine the hydrologic effects of mechanical methods of brush control. Root plowing to remove the brush on one watershed reduced surface runoff about 20%. (Sims-ISWS)

'ARIMA' PROCESSES FOR HYDROMETEOROLOGICAL FORECASTING AND SIMULATION (LES PROCESSUS DU TYPE 'ARIMA' POUR LA PREVISION ET LA SIMULATION EN HYDROMETEOROLOGIE),
Purdue Univ., Lafayette, IN. Water Resources Research Center.
J. W. Delleur.
La Houille Blanche No. 6. p 391-400, 1978. 7 fig, 2 tab, 16 ref. (English summary). OWRT B-036-IND (19).

Descriptors: *Weather forecasting, *Runoff forecasting, *Stochastic processes, Simulation analysis, Synthetic hydrology, ARIMA, Hydrometeorology.

'ARIMA' stochastic process models are combinations of autoregressive models and movable averages over random independent variables. Their flexibility allows simulation of the random structures of stationary or non-stationary chronological hydrometeorology records. Their application is facilitated by routine model identification, estimation and test methods. Applications of 'ARIMA' models for description of monthly rainfall and both monthly and annual runoff in a certain number of catchments in the central United States are discussed. An example is given of the use of such models for forecasting runoff from forecast rainfall data.

EFFECTS OF A BARRIER ON TEMPERATURE STRUCTURE AND MIXING IN THERMALLY STRATIFIED WATER COOLED FROM ABOVE,
Purdue Univ., Lafayette, IN. School of Mechanical Engineering.
R. Viskanta, A. Karalis, and M. Behnia.
Warme- und Stoffubertragung, Vol. 11, p 229-239, 1978. 8 fig, 1 tab, 18 ref. OWRT B-077-IND(3).

Descriptors: *Heat transfer, *Convection, *Cooling, *Stratification, Heat flow, Energy transfer, Temperature, Thermocline, Interferometry, Mach-Zehnder Interferometer.

A Mach-Zehnder interferometer was used to study the unsteady temperature structure in radiation

stratified water cooled from above. Temperature distribution measurements in a test cell filled with distilled water provide conclusive evidence that the thermal structure between the air-water interface and the stable region is controlled by buoyancy induced natural convection. The cooling from above produces a complex vertical temperature profile which can be divided into several distinct regimes. Introduction of a thin, rigid transparent (glass) plate into the water before thermal stratification by radiation and cooling confines the natural convection driven flow and reduces the intensity of mixing. As a result, the energy transport from the interior of the water layer to the interface is decreased. However, under the experimental conditions tested use of rigid, horizontal plates introduced in the fluid was not very effective in reducing the transport of heat from the warm interior to the cooler interface.

FREE CONVECTION IN THERMALLY STRATIFIED WATER COOLED FROM ABOVE,
Purdue Univ., Lafayette, IN. School of Mechanical Engineering.
M. Behnia, and R. Viskanta.
International Journal of Heat Mass Transfer. Vol. 22, p 611-623, 1979. 11 fig, 1 tab, 30 ref. OWRT B-077-IND(4).

Descriptors: *Heat transfer, *Convection, *Cooling, *Stratification, Heat flow, Energy transfer, Temperature, Thermocline, Interferometry, Mach-Zehnder Interferometer.

The thermal and fluid kinetics of the convective layer during cooling from the free surface of a thermally stratified water by convection, latent energy transport, and radiation is studied. Laboratory experiments were performed and a Mach-Zehnder interferometer was used to measure the unsteady temperature distribution in a test cell filled with water which was previously stratified. A simple mathematical model based on a thermal energy balance is developed to predict the thickness and the mean temperature of the layer. The model predictions agreed to within 10% with the data from controlled laboratory experiments. It was found that the numerical solution to the model equations agree better with the experimental data than those based on the closed form analytical solution using the constant average surface heat flux. It was determined that the surface boundary condition and the internal physical processes of mixing and entrainment must be better understood in order to model the dynamics of the mixed layer in natural waterbodies.

A GEOHYDROLOGIC OVERVIEW FOR THE PECORA SYMPOSIUM FIELD TRIP, JUNE 1979,
Geological Survey, Huron, SD. Water Resources Div.
N. C. Koch.
Geological Survey open-file report 79-563, May 1979. 19 p, 3 fig, 6 ref.

Descriptors: *Available water, *Surface waters, *Groundwater resources, *Hydrogeology, *South Dakota, Aquifer characteristics, Water wells, Water yield, Streamflow, Precipitation(Atmospheric), Lakes, *Big Sioux River basin(S Dak).

The settlement and development of South Dakota and the Big Sioux River basin have been closely related to water resources. The climate is a continental type and annual precipitation in the basin is about 23 inches. The area of the field trip lies within the Coteau des Prairies, a massive highland within the Central Lowlands Province. It is drained primarily by the Big Sioux River. The bedrock underlying the coteau is a series of Cretaceous sedimentary rocks and the Sioux Quartzite of Precambrian age. Wells in the Cretaceous Dakota Sandstone yield from 10 to 1,000 gallons per minute; the other bedrock formations generally yield less than 10 gallons per minute. The glacial outwash deposits on the coteau are generally excellent sources of ground water; the other glacial deposits, till and loess, are not dependable sources. (Woodard-USGS)

A PHYSICALLY BASED, VARIABLE CONTRIBUTING AREA MODEL OF BASIN HYDROLOGY,
Institute of Hydrology, Wallingford (England).
K. J. Beven, and M. J. Kirkby.
Hydrological Sciences Bulletin, Vol. 24, No. 1, p 43-69, March 1979. 16 fig, 1 tab, 36 ref.

Descriptors: *Watersheds(Basins), *Hydrology, *Model studies, *Hydrological aspects, Analytical techniques, Hydrologic properties, Areal, Infiltration, Mathematical models, Soil moisture, Saturated soils, Routing, Channels, Spatial distribution, Overland flow, Calibrations, Interception, Foreign research, On-site tests, Runoff, *Great Britain, Sub-basin model.

A hydrological forecasting model was presented that attempts to combine the important distributed effects of channel network topology and dynamic contributing areas with the advantages of simple lumped parameter basin models. Quick response flow is predicted from a storage/contributing area relationship derived analytically from the topographic structure of a unit within a basin. Average soil water response was represented by a constant leakage infiltration store and an exponential subsurface water store. A simple, non-linear routing procedure related to the link frequency distribution of the channel network completes the model and allows distinct basin sub-units, such as headwater and sideslope areas to be modelled separately. The model parameters are physically based in the sense that they may be determined directly by measurement and the model may be used at ungauged sites. Procedures for applying the model and tests with data from the Crimple Beck basin were described. Using only measured and estimated parameter values, without optimization, the model makes satisfactory predictions of basin response. The modular form of the model structure should allow application over a range of small and medium sized basins while retaining the possibility of including more complex model components when suitable data are available. THE ZOOGEOGRAPHY OF THE FRESHWATER FISHES OF THE POTOMAC RIVER BASIN,
Maryland Univ., Frostburg. Appalachian Environmental Lab.
J. R. Stauffer, Jr., C. H. Hocutt, and D. S. Lee.
Interstate Commission on the Potomac River Basin, Rockville MD. Technical Publication 78-2. In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T, Eds., 1978. p 44-54, 2 fig, 61 ref.

Descriptors: *Freshwater fish, *Fish migration, *Fish populations, *Fish establishment, *Geologic history, *Potomac River, River systems, Drainage patterns(Geologic), Watersheds(Divides).

The Potomac River is part of a transition area between the northern Atlantic slope drainages, characterized by few native species and endemics, and the more rich southern Atlantic slope drainages. Presently 78 species and one endemic are known from the Potomac. The Potomac is the northern range limit for Phoxinus areas, Nocomis leptocephalus, and Moxostoma rhothoecum, and the southern limit for Notropis s. spilopterus, Pimephales notatus, Semotilus m. marginata, Percopsis omiscomaycus, and Percina caprodes. Etheostoma caeruleum is known only to the Potomac on the Atlantic slope. Northern forms of Potomac fauna entered through stream captures with the Susquehanna River, but because of the similarity of the fauna of both basins, no specific cases are documented. Ohio River fishes most likely entered through captures with the Monongahela River basin. An exchange between the Potomac and Roanoke-Teays system through the James is indicated by the presence of Moxostoma rhothoecum. The Atlantic coastal plain endemics found in the Potomac most likely dispersed into and from the Potomac through the prevalent, low-lying, interconnecting streams and ditches. The species introduced into the Potomac have been subdivided into Old World species and transplants, which are those native to North America. Three species are no longer found in the Potomac and one, Acipenser brevirostrum, is on the Federal threatened and endangered list. (Davison-IPA)

FISHERY RESOURCES AND MANAGEMENT IN WEST VIRGINIA,
West Virginia Dept. of Natural Resources, Romney.
G. E. Lewis.
Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2. In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 55-58, 2 tab, 9 ref.

Descriptors: *Fish, *Fishing, *Fish populations, *Fish establishment, *Aquatic environment, *Aquatic habitats, Sport fish, River systems, Drainage systems, River basins, Watersheds(Basins), Interstate rivers, Potomac River, West Virginia, Creel census.

Nearly half of the cold-water and warm-water fishery resources in West Virginia are in the Potomac River drainage where most of the game fish have been introduced. The three largest streams within the Potomac basin of West Virginia are the Shenandoah, South Branch, and Cacapon Rivers. A shift in the Shenandoah towards species favoring eutrophic situation is attributed to the high levels of nitrogen and phosphorus compounds in waste water from cities, land surface runoff, and organic humus. Fishing is good to excellent for smallmouth bass and sunfish in the Cacapon and South Branch rivers. The West Virginia Department of Natural resources is currently acquiring strategically located sites to facilitate access to the larger streams of the Potomac basin. Stream sediment, particularly heavy in areas being urbanized, has become a source of fish habitat degradation. A demonstration project in stream bank stabilization undertaken by the Fisheries Section of the Division of Wildlife to combat sediment transport has shown encouraging results. The diversity of physiographic features of some of the streams of the Potomac drainage in West Virginia made them potential additions to the National Wild and Scenic Rivers system. (Davison-IPA)

REDUCING THE COST OF CONTINUOUS HYDROLOGIC-HYDRAULIC SIMULATION,
Donohue and Associates, Inc., Waukesha, WI.
S. G. Walesh, and D. F. Snyder.
Water Resources Bulletin, Vol. 15, No. 3, p 644-659, June 1979. 5 fig, 3 tab, 11 ref.

Descriptors: *Computers, *Simulation analysis, *Continuous models, *Water quality, *Hydrology, *Hydraulics, *FRIT technique, Watersheds(Basins), Wisconsin, Meteorology, Cost reductions, Flood water storage, Land use changes, Channel modification, Discrete events, Discharge-frequency relations, Effects, Probability, Systems analysis.

The use of continuous hydrologic-hydraulic-water quality models is inhibited by their large computer run costs relative to cost incurred with discrete event models. The fixed recurrence interval transfer (FRIT) technique is a means of achieving substantial reductions in computer costs associated with continuous models while retaining their technical advantages. The FRIT technique is applicable where it is reasonable to assume that the recurrence interval of the response of a watershed to a causative meteorologic event is the same for both 'before' and 'after' conditions. Example applications of FRIT to the hydrologic-hydraulic modeling of floodwater storage, land use changes, and channel modifications are presented to demonstrate the procedure, to suggest the expected accuracy, and to illustrate how computer run costs might be reduced by 99% or more. The FRIT technique is intended for preliminary assessment of the impact of alternative land use conditions and structural water control measures. (Bell-Graf--Cornell)

2B. Precipitation

ANNUAL PRECIPITATION IN THE NORTHEAST UNITED STATES: LONG MEMORY, SHORT MEMORY, OR NO MEMORY,
Pennsylvania State Univ., University Park. Dept. of Geosciences.
K. W. Potter.
Water Resources Research, Vol. 15, No. 2, p 340-346, April 1979. 3 fig, 4 tab, 23 ref.

Descriptors: *Precipitation(Atmospheric), *Climatology, *Statistics, *Northeast U.S., Climatic data, Analytical techniques, Data processing, Statistical methods, Homogeneity, Annual, Time series analysis, Correlation analysis, Rainfall, Snowfall, Streamflow, Meteorology, Autocorrelation analysis.

Regional filtering and intervention analysis of nineteen 100-year precipitation series from the northeast United States indicated that 8 of these series are of doubtful homogeneity. Statistics of these series were generally distorted. Of particular significance is the inflation of the short-lag autocorrelation function and Hurst coefficient. For the precipitation series which appear to be homogeneous, the estimated autocorrelation functions and Hurst coefficients are remarkably consistent with a lag 1 autoregressive process, indicating that annual precipitation in the northeast United States is a short-memory process. Based on these results, it was recommended that before long-term memory is inferred from analyses of hydrologic series, the homogeneity of these series should be clearly established. (Sims-ISWS)

USE OF SPECIFIC CONDUCTANCE AND CONTACT TIME RELATIONS FOR SEPARATING FLOW COMPONENTS IN STORM RUNOFF,
New South Wales Univ., Kensington (Australia). School of Civil Engineering.
D. H. Pilgrim, D. D. Huff, and T. D. Steele.
Water Resources Research, Vol. 15, No. 2, p 329-339, April 1979. 7 fig, 23 ref.

Descriptors: *Storm runoff, *Base flow, *Dissolved solids, On-site investigations, Flow, Specific conductivity, Runoff, Soil water, Subsurface flow, Surface runoff, Soil water, Sampling, Data processing, Analytical techniques, Solids contact processes, Contact time.

The difference between the dissolved-solids concentrations in base flow and in storm flow has often been used as the basis for separating components of flow. However, an analysis that explicitly relates the amount of time that runoff water has been in contact with watershed soils to the resulting dissolved-solids concentration showed that simple mass balance chemistry methods for hydrograph separation are misleading. Field studies of surface and subsurface storm flow, when coupled with laboratory determination of the relationship between contact time and dissolved solids content of a soil water mixture, suggested that the residence time of infiltrated water is as short as a few hours in the cases studied. In those cases, hydrograph separation methods based on the simple mass balance equation for the dissolved solids will yield considerable overestimates of the base flow component. (Sims-ISWS)

ON THE INFLUENCE OF THE SPATIAL DISTRIBUTION OF RAINFALL ON STORM RUNOFF,
Corps of Engineers, Washington, DC.
C. B. Wilson, J. B. Valdes, and I. Rodriguez-Iturbe.
Water Resources Research, Vol. 15, No. 2, p 321-328, April 1979. 6 fig, 2 tab, 8 ref. NWS 4-36738.

Descriptors: *Rainfall, *Runoff, *Storm runoff, *Model studies, Mathematical models, Spatial distribution, Isohyets, Mapping, Hydrographs, Discharge(Water), Streams, Rainfall-runoff relationships, Watersheds(Basins), Networks, Rain gages, Meteorology.

This study was an assessment of the importance of precipitation accuracy on the rainfall-runoff modeling of a small catchment. Two mathematical models were used in the investigation: a deterministic rainfall-runoff model based on the kinematic wave approximation and a nonstationary time-varying multi-dimensional rainfall generation model. It was implicitly assumed that this rainfall generation model is an appropriate mathematical representation of the natural phenomenon of rainfall. The deterministic rainfall-runoff model was used to represent the 26.5 sq mi catchment of the Rio Fajardo in northeastern Puerto Rico. The rainfall model generates synthetic rainfall which serves as the input to this runoff model. The influence of the spatial distribution of the rainfall input on the discharge was analyzed by using 1 rain gage or 20 rain gages to record the synthetic storms. The isohyetal maps and hyetographs of the synthetic storms, together with the storm hydrographs produced by the runoff model, were analyzed, with specific attention given to the volume of storm runoff, time-to-peak runoff, and peak runoff. The experiments showed that the spatial distribution of rain and the accuracy of the precipitation input have a marked influence on the outflow hydrograph from a small catchment. (Sims-ISWS)

AN INVESTIGATION INTO THE EFFECT OF STORM TYPE ON PRECIPITATION IN A SMALL MOUNTAIN WATERSHED,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
W. J. March, J. R. Wallace, and L. W. Swift, Jr.
Water Resources Research, Vol. 15, No. 2, p 298-304, April 1979. 1 fig, 6 tab, 18 ref.

Descriptors: *Precipitation(Atmospheric), *Rainfall, *Storms, *Model studies, *Appalachian Mountain region, Mathematical models, Evaluation, On-site data collections, Watersheds(Basins), Forest watersheds, Mountains, Mountain forests, Networks, Rain gages, Data processing, Meteorology.

A set of regression equations relating storm rainfall depth to watershed topography and storm type was derived for the high-density precipitation network at Coweeta Hydrologic Laboratory. The most general equation predicted storm amounts for an independent test group of gages with an average error of 0.38 cm (0.15 inches). The dependent variables was the ratio of the rainfall at each site to the rainfall at a base gage. Predictive variables were topographic slope, aspect, ground elevation at the gage site, and smoothed elevation. The smoothed elevation, which is the elevation the gage would assume if it were on a smooth plane representing the general topography of the terrain, appeared in more equations than any other variable. One equation was calculated for each of 6 identified storm types, and one equation was calculated with all storms considered together. Overall, the equations which considered storm type were not better predictors of site rainfall than the equation which did not consider storm type. Predictions of storm amounts were closest to measured amounts for storms where the low-pressure center passed east of Coweeta, while the predictions for the air-mass or thunderstorm type had the greatest errors. The prediction errors of the equations for warm-, cold-, and stationary-front storm types were intermediate. The small number of tropical storms limited development and testing of equations for that type. (Sims-ISWS)

PERIODIC SURGING OF THE ANTARCTIC ICE SHEET--AN ASSESSMENT BY MODELING,
Melbourne Univ., Parkville (Australia). Antarctic Div.
W. F. Budd, and B. J. McInnes.
Hydrological Sciences Bulletin, Vol. 24, No. 1, p 95-104, March 1979. 7 fig, 2 tab, 16 ref.

Descriptors: *Ice, *Surges, *Model studies, *Antarctic, Movement, Glaciers, On-site investigations, Velocity, On-site data collections, Physical properties.

A numerical model has been developed which simulates surging in certain glaciers and ice sheets in an apparently realistic manner. This model has been found to give small mountain glaciers to large sectors of ice caps. The model reproduces realistically many features of these ice masses such as the period of the surge, the duration, the velocity of advance, the magnitude of the advance, and the changes in ice thickness. The application of the model to the Antarctic ice sheet is made more difficult by the problem caused by the temperature dependence of the flow properties of ice. This means that for a complete study the interaction with the environment needs to be considered. However, at this stage preliminary calculations indicate a number of features that are relevant to the effect of Antarctic ice surges on the global climate. These include the period between surges, the duration of the surge, the amount of ice advanced and the changes in thickness of the ice sheet. (See also W75-03085 and W75-08713) (Humphreys-ISWS)

EFFECT OF SURFACE MELTWATER ACCUMULATION ON THE DISSIPATION OF LAKE ICE,
Delaware Univ., Newark. Dept. of Civil Engineering.
A. Wake, and R. R. Rumer.
Water Resources Research, Vol. 15, No. 2, p 430-434, April 1979. 8 fig, 2 tab, 13 ref. NOAA 03-6-022-352636.

Descriptors: *Lake ice, *Melting, *Boundary processes, *Model studies, Melt water, Ice, Air-water interfaces, Mathematical models, Heat balance, Albedo, Heat transfer, Analytical techniques, Solar radiation, Air-ice interface.

The rate of ice melt with and without water accumulation on the ice surface was computed based on the interfacial heat exchange processes, the thermal diffusion of heat through the accumulated water, and the internal absorption of solar radiation. Although the accumulated water does increase the net absorbed solar radiation due to reduced albedo, the resulting air-water interface temperature was found to be considerably greater than 0C, thereby decreasing the net long-wave, sensible, and evaporative heat inputs. The findings indicated that the overall effect of accumulated water on ice melt

may not be quite as large as expected from albedo differences alone. The often used bare ice assumption is still believed to serve as a good engineering approximation. More study is needed to relate the vertical thermal diffusivity to such factors as wind effects, gravitational stability, and water depth. Verification would be difficult in the field, but laboratory experimentation seems possible. (Humphreys-ISWS)

2D. Evaporation and Transpiration

EVAPOTRANSPIRATION COMPUTED TO ESTIMATE LEACHING FRACTIONS,
Science and Education Administration, Grand Junction, CO.
D. C. Kincaid, E. G. Kruse, H. R. Duke, and D. F. Champion.
Transactions of The American Society of Agricultural Engineers, Vol. 22, No. 2, p 310-319, March-April 1979. 4 fig, 3 tab, 10 ref.

Descriptors: *Evapotranspiration, *Leaching, *Irrigation, *Colorado, Model studies, Simulation analysis, Reclamation, Soils, Winds, Dew point, Vapor pressure, Wind velocity, Equations, *Leaching fractions, *Potential evapotranspiration, *Grand Valley(CO), Soil heat flux, Saturation vapor pressure.

The United States Department of Agriculture Irrigation Scheduling Program with a Penman-type potential evapotranspiration equation was used as a simulation model to compute daily water use and deep percolation amounts on several sprinkler and furrow irrigated sites in the Grand Valley of Colorado. Input included daily weather data from one site and measured water applications on each site for the 1976 irrigation season. Leaching fractions of 0 to 0.1 were determined for a sprinkler irrigated field. For furrow irrigated sites, average seasonal leaching fractions of 0.28 and 0.51 were computed for the low and high intake rate soils, respectively. Furrow intake measuremets and computed deep percolation amounts indicated that about 1/2 of the seasonal leaching occurred following the first irrigation. (Roberts-ISWS)

WIND PROFILE PARAMETERS AND TURBULENCE INTENSITY OVER SEVERAL ROUGHNESS ELEMENT GEOMETRIES,
Science and Education Administration, Manhattan, KS.
L. Lyles, and B. E. Allison.
Transactions of the American Society of Agricultural Engineers, Vol. 22, No. 2, p 334-338, 343, March-April 1979. 3 fig, 4 tab, 15 ref.

Descriptors: *Winds, *Wind erosion, *Evaporation, *Soils, Soil water, Soil moisture, Particle size, Profiles, Wind velocity, Roughness coefficient, Turbulence, Velocity, Model studies, Mathematical models.

Estimating equations were developed for the mean velocity profile parameters in the logarithmic law and for longitudinal turbulence intensity. The estimates were based on wind tunnel measurements over several roughness element shapes, sizes, heights, and geometrical patterns. All the prediction equations had correlation coefficients greater than 0.90. These equations have application in wind erosion of soil particles, water evaporation, and transport of gases. They only apply to a particular set of conditions, which indicates a need for more universally applicable equations for the profile parameters and turbulence intensity. (Sims-ISWS)

Water Resources Research, Vol. 15, No. 2, p 443-450, April 1979. 9 fig, 34 ref.

Descriptors: *Evapotranspiration, *Meteorological data, *Model studies, Advection, Evaporation, Atmosphere, Energy budget, Droughts, Watersheds(Basins), Soil moisture, Equations, Mathematical studies, Regions, Measurement, *Regional evapotranspiration, *Potential evaporation, Symmetry, Conceptual model, Regional advection, Evaporative power, Atmospheric conditions, Energy budget method, Severe drought.

Actual regional evapotranspiration was calculated by means of a procedure requiring only meteorological data, which are those data commonly used in the various versions of the combination approach for potential evaporation. The approach was based on a conceptual model involving, first, the effect of regional advection on potential evaporation, and second, an assumed symmetry between potential and actual evaporation with respect to the evaporative power of the air in the absence of advection. Thus, the degree of nonavailability of water for evapotranspiration, that is the aridity of the region, was deduced from the regional advection of drying power of the air, as implied by the atmospheric conditions. The approach was found to give good agreement with daily data of evapotranspiration obtained by means of an energy budget method for a period of severe drought in a rural watershed in a sandy region. One of the advantages is that no soil moisture data, no stomatal resistance properties of the vegetation, nor any other additional aridity parameters are required to determine actual evapotranspiration. In: Hydrology Research Division, Annual Progress Reports and Short Research Notes, 1977-78, p 5-13, 1979. 5 fig, 1 tab, 9 ref. Environment Canada Inland Waters Directorate, Ottawa, Report Series No. 64. GW 68-8.

Descriptors: *Evapotranspiration, *Computer models, *Lakes, Climatic data, Computer programs, Temperature, Atmospheric pressure, Dew point, Climatology, Evaporation, Solar radiation.

The model described for estimating areal evapotranspiration is a modification of an earlier model, and provides estimates of lake evaporation from routine climatological observations in the land environment. Required input lake characteristics are latitude, altitude (or average atmospheric pressure), and an estimate of average annual precipitation. Require data inputs are monthly air temperatures, dew point temperatures, and the ratios of observed to maximum possible sunshine duration made in land or lake environments. The model, programmed in Fortran for the Hewlett-Packard 9100 A-9101 A desk calculator and the Hewlett-Packard pocket calculator, is designed for use anywhere in the world. The lake evaporation estimates, sensitive to errors in the sunshine duration inputs, are relatively insensitive to errors in the air temperature and dew point temperature inputs in comparison with areal evapotranspiration estimates. Seasonal changes in subsurface heat storage are not taken into account, and the model cannot provide realistic monthly evaporation estimates from deep lakes. Model estimates of annual lake evaporation are plotted against corresponding water budget estimates for Lake Hefner, Oklahoma; the Salton Sea and Silver Lake in California; Pyramid and Winnemucca Lakes in Nevada; Lake Ontario; and Dauphin Lake in Manitoba. Monthly average values for model estimates of evaporation and the water budget estimates are tabulated for Pyramid and Winnemucca Lakes. The maps provided show the average annual lake evaporation and the average annual or areal evapotranspiration in Canada and the United States. (Davison-IPA)

DRAINAGE EVOLUTION AND FISH DISPERSAL IN THE CENTRAL APPALACHIANS: SUMMARY,
Maryland Univ., Frostburg. Appalachian Environmental Lab.
C. H. Hocutt.
Geological Society of America Bulletin, Part I, Vol. 90, p 129-130, February 1979. 1 fig, 4 ref.

Descriptors: *Fish migration, *Geologic history, *Pleistocene epoch, *Rivers, *Drainage, *Drainage effects, Aquatic habitats, Fish barriers, Drainage patterns(Geologic), Drainage systems, History.

Evidence indicates that the Appalachian Plateau once extended eastward to the present-day divide between the Greenbriar and James Rivers along Allegheny Mountain. During Pliocene time this extended plateau was drained by the Gauley River. Glacial ponding occurred in the Teays drainage during the Pleistocene, facilitating the dispersal of certain fish species and inhibiting the dispersal of others. Fish migrated up Teays River along the shoreline of glacial Lake Tight to negotiate the Kanawha Falls area. There, the fishes found the strenuous Gauley River route less difficult than the evolving Teays-New River gorge. Concurrently, during the Pleistocene, Greenbriar River breached a major divide between it and Old Gauley, rapidly extending its drainage along a limestone belt. At this time faunal exchanges occurred along the Gauley-Greenbriar interface which may have facilitated the dispersal of Teays stock to the Atlantic slope through bypassing the Teays gorge. A map of the area is provided. (Davison-IPA)

OPTIMAL DESIGN OF CULVERTS UNDER UNCERTAINTIES,
Texas Univ. at Austin. Dept. of Civil Engineering.
L. W. Mays.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Proceedings Paper 14572, p 443-460, May 1979. 6 fig, 4 tab, 13 ref, 2 append. NSF ENG78-05449.

Descriptors: *Culverts, *Design, *Optimization, *Model studies, Mathematical models, Computer models, Probability, Statistics, Structures, Highways, Hydraulic structures, Flood damage, Risks, Water resources, Hydraulics, Hydrology, Civil engineering, Uncertainty principle, Optimal design.

In the design of highway drainage culverts there are many uncertainties involved in addition to the normally considered hydrologic uncertainty due to the randomness in flood and rainfall frequencies. Uncertainties can be contributed from many sources and are classified as hydrologic, hydraulic, structural, and economic with subtypes of uncertainties in each of these categories. This paper described a procedure for systematically analyzing and incorporating the uncertainties into the optimal design of drainage culverts. The procedure was based upon the concepts of hydrologic risk, first-order analysis of uncertainties, evaluation of expected damages, and optimization. The optimization model was used to select the magnitudes of the design variables in order to minimize total expected project costs. Using such a design procedure, the proper trade-off analysis among the potential flood damages, the design uncertainties, and the cost of the project was performed in determining the design. FLOW RESISTANCE IN COBBLE AND BOULDER RIVERBEDS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.

D. B. Simons, K. S. Al-Shaikh-Ali, and R-M. Li.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Proceedings Paper 14576, p 477-488, May 1979. 12 fig, 12 ref, 2 append.

Descriptors: *Streamflow, *Flow resistance, *Sediments, Beds, Beds under water, River beds, Streams, Rivers, Floods, Flood control, Flood flow, Sands, Gravels, Boulders, Model studies, Hydraulic models, Mannings equation, Channels, Channel flow, Roughness(Hydraulic), Hydraulics.

Field evidence and experimental evidence were presented to demonstrate the importance of the inflow of sand and gravel size sediments on resistance to flow in channels whose beds are primarily cobbles, rocks, and boulders. The released sediments fill the spaces between the larger roughness elements, forcing the channel to behave as a sand bed channel at a much reduced resistance to flow coefficient. Resistance to flow in these channels decreases, resulting in underestimations of: (1) water discharge by a factor of 2; (2) sediment discharge by a factor ranging between 8 and 64; and (3) velocity of flow by a factor of 2. Failure to estimate these quantities with a reasonable degree of accuracy results in the following: (1) underestimation of the actual quantity of available water; (2) improper selection of bank protection material; (3) overestimation of reservoir life; (4) unsafe design of scour depths at hydraulic structures; (5) improper design of location; and (6) others relating to river control and development. FLOW CHARACTERISTICS IN TWO-DIMENSIONAL EXPANSIONS,
S. V. Regional Coll. of Engineering and Technology, Surat (India). Dept. of Civil Engineering.
P. R. Mehta.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Proceedings Paper 14579, p 501-516, May 1979. 18 fig, 2 tab, 9 ref, 1 append.

Descriptors: *Flow, *Fluid mechanics, *Flow characteristics, *Flow separation, Model studies, Mathematical models, Numerical analysis, Laboratory tests, Hydraulic models, Turbulence, Viscosity, Shear, Streams, Channels, Walls, Channel flow, Analytical techniques, Hydraulics, Expansion, Asymmetry, Shear flow.

Flow patterns for recirculating flows in sudden two-dimensional expansions were obtained by numerical approaches and experimental studies. Analytical results for low expansion ratio of 1.25 were in good agreement with those of experimental findings. For larger expansion ratios, experimental findings revealed that the flow patterns were asymmetric and unstable. Two distinct types of flow occurred in which the flow characteristics were almost the mirror image of one another in each type of flow. For large expansion ratios, turbulence developed peak values early and also decayed at faster rate after the points of reattachment. Flow attained symmetric conditions earlier for larger expansion ratios. (Sims-ISWS)

COLLIE RIVER UNDERFLOW INTO THE WELLINGTON RESERVOIR,
Western Australia Univ., Nedlands. Dept. of Civil Engineering.
B. Hebbert, J. Imberger, I. Loh, and J. Patterson.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Proceedings Paper 14593, p 533-545, May 1979. 7 fig, 2 tab, 9 ref, 2 append.

Descriptors: *Reservoirs, *Rivers, *Underflow, *Water quality, *Australia, On-site investigations, Model studies, Mathematical models, Flow, Streamflow, Entrainment, Salinity, Density, Temperature, Water temperature, *Collie River(Australia), *Wellington Reservoir(Australia).

Field data gathered from a Western Australian reservoir were used to obtain an estimate for the entrainment coefficient of the underflowing river. By the use of a steady, normal-flow theory, the entrainment coefficient is related to the flow and river channel characteristics. By combination with a general turbulent entrainment law, it was shown that the entrainment coefficient and dilution may be directly related to the physical characteristics of the river channel, and thus may be estimated without recourse to a field experiment. In order to determine the initial underflow depth and the location of the plunge line, a simple theory using the concept of a normal flow depth was used, the results of which compared favorably with observation. INTERACTION BETWEEN MAIN CHANNEL AND FLOOD-PLAIN FLOWS,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
N. Rajaratnam, and R. M. Ahmadi.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Proceedings Paper 14591, p 573-588, May 1979. 12 fig, 1 tab, 17 ref, 2 append.

Descriptors: *Flood flow, *Flood plains, *Open channel flow, Momentum transfer, Flow, River flow, Rivers, Channels, Turbulent flow, Roughness(Hydraulic), Shear stress, Model studies, Hydraulic models, Laboratory tests, Hydraulics, Velocity, Profiles, Hydrology.

The experimental results presented in this paper demonstrated the transport of longitudinal momentum from the main channel to the floodplain. This transport increased the bed shear stress in the floodplain and produced the opposite result on the main channel. The velocity profiles in the region affected by this interaction were found to be similar if viewed with respect to the undisturbed flow in the floodplain. The velocity and length scales were correlated with the ratio of the depth of flow in the main channel to that in the floodplain. In these experiments, the main channel was narrow, and thus the interaction extended inwards to the center line of the main channel. For the concepts introduced in this paper to be used in solving practical problems, further experiments should be conducted with wider main channels, including the effects of bed roughness. WAVE RUN-UP INFLUENCE ON OVERTOPPING OF LEVEES,
Agricultural Univ., Wageningen (Netherlands). Dept. of Hydraulics and Catchment Hydrology.
D. H. Keuning, and J. B. M. van Acker.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Proceedings Paper 14588, p 589-604, May 1979. 6 fig, 9 tab, 6 ref, 2 append.

Descriptors: *Levees, *Flood waves, *Winds, *Wave pile-up, Rivers, Flood plains, Model studies, Mathematical models, Stochastic processes, Probability, Floods, Waves(Water), Wind velocity, *Waal River(The Netherlands), *The Netherlands, Overtopping, Wave runup.

A procedure for calculating probabilities of overtopping from the combined occurrence of floods and wave runup with an application to a section of the Waal river in the Netherlands was presented. Annual exceedance probabilities were known for the floods. Runup was computed from wind velocity and wind direction. A stochastic model for these quantities was established, based on a record of 10-yr wind observations. The model was used for generating a series of wind velocities and directions. Combining these sequences with floods, the magnitude of the runup and the probabilities of overtopping for some heights of the levee were computed. The sensitivity of the results with respect to the shape of the flood waves and the simulation models for runup was studied. (Sims-ISWS)

METHODOLOGIES FOR THE DETERMINATION OF FLOW DURATION CURVES AT SPECIFIC SITES ON UNGAGED REACHES OF STREAMS,
Idaho Univ., Moscow. Graduate School.
R. L. Emmert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 397, Price codes: A07 in paper copy, A01 in microfiche. M.S. Thesis, May 1979. 126 p, 50 fig, 27 tab, 18 ref. OWRT A-057-IDA (1), 14-34-0001-9014.

Descriptors: *Flow duration, Streamflow, Hydrologic data, Duration curves, Regional analysis, Hydroelectric power.

This study examines several techniques for synthesizing flow duration curves, at ungaged river sites, for application to hydro-electric energy surveys of entire river systems. Three techniques are presented which can be utilized on natural flowing rivers. Data requirements consist of existing streamflow records and compilations of area-precipitation products. The procedures are based on regression equations and normalization of existing flow duration curves. The three techniques are applied to the Clearwater River in Idaho and a comparison of their results is made. A fourth technique is presented for synthesizing flow duration curves for regulated streams using similar data input as for the three natural flow methods. This procedure is applied to the regulated portions of the Priest and Payette Rivers in Idaho. The Method is also applicable to natural streams and this is illustrated by application to the Clearwater River. Comparisons of synthetic results to actual discharge and energy values for various exceedance percents along with percent differences are presented to give indications of error magnitudes. JUNCTION LOSSES IN OPEN CHANNEL FLOWS,
Connecticut Univ., Storrs. Dept. of Civil Engineering.
J. D. Lin, and H. K. Soong.
Water Resources Research, Vol. 15, No. 2, p 414-418, April 1979. 6 fig, 3 tab, 8 ref. OWRT A-051-CONN (4), 1431-0001-3507.

Descriptors: *Open channel flow, Energy loss, Manning equation, Flow rates, Flow friction, One-dimensional flow, Turbulent mixing, Lateral inflow.

The energy balance of spatially varied flows at the junction of a rectangular open channel and a side channel is investigated by a one-dimensional flow analysis of experimental data obtained from a laboratory channel system. By means of a large control volume enclosing the neighborhood of the junction and having the control surface located at the cross sections where the flow is undirectional, the energy loss can be evaluated. The energy loss is then divided into two components: the boundary friction loss and the turbulent mixing loss. The turbulent mixing loss is found to be of the same order of magnitude as the boundary friction loss evaluated by Manning's formula. The loss coefficient is derived as a function of the ratio of lateral to total flow rate. An energy transfer process from the main channel flow to the lateral inflow or vice versa, which is implicit in the one-dimensional flow analysis, can be analyzed by means of the turbulent mixing loss coefficients. The result may be applied to the calculation of energy losses in the junction or in spatially varied flows with lateral inflow in an open channel flow analysis. (de Lare-Conn)

HYDROLOGIC DATA FOR NORTH CREEK, TRINITY RIVER BASIN, TEXAS, 1976,
Geological Survey, Austin, TX. Water Resources Div.

C. C. Kidwell.
Geological Survey open-file report 77-732, July 1978. 42 p, 2 fig, 3 tab.

Descriptors: *Hydrologic data, *Streamflow, *Rainfall-runoff relationships, *Retaining walls, *Floodwater, Gaging stations, Discharge(Water), Hydrographs, Mass curves, Flood control, Small watersheds, Texas, *North Creek, *Trinity River basin.

This report contains rainfall and runoff data collected during the 1976 water year for a 21.6-square mile area above the stream-gaging station on North Creek near Jacksboro, Texas. A continuous water-stage recording gage was installed at one representative floodwater-retarding structure (site 28-A) on Oct. 5, 1972. The data are used to compute the contents, surface area, inflow, and outflow at this site. The stream-gaging station on North Creek near Jacksboro continuously records the water level which, with measurements of streamflow, is used to compute the runoff from the study area. Streamflow records at this gage began on Aug. 8, 1956. Detailed rainfall-runoff computations, including hydrographs and mass curves, are included for two storm periods during the 1976 water year at the stream-gaging station. (Woodard-USGS)

PERMEABLE WALL EFFECTS ON POISEUILLE FLOW,
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
P. L-F. Liu.
Journal of the Engineering Mechanics Division, American Society of Civil Engineers, Vol. 105, No. EM3, Technical Note, p 470-476, June 1979. 2 fig, 2 tab, 8 ref, 1 append. NY Sea Grant Institute 44-S043-C, 44-S051-C.

Descriptors: *Viscous flow, *Boundaries(Surfaces), *Porous media, *Earth-water interfaces, Permeability, Boundary layers, Theoretical analysis, Analytical techniques, Velocity, Profiles, Hydraulics, Flow, Laboratory tests, Porosity, Boundary processes, Poiseuille flow, Permeable boundary, Two-dimensional flow.

The effects of permeable walls on Poiseuille flow were investigated. Due to the transfer of forward momentum across the permeable interface, a very thin boundary layer region is induced within the porous material adjacent to the interface. The boundary layer structure was found, and it depends strongly on the properties of the material in the boundary regions. The present theory agrees with available experiments very well. However more controlled experimental data are still needed. The results presented can be extended to study the interactions between water waves and seabed, which usually consist of permeable material. Although the unsteadiness becomes one of the new features of these types of problems, the oscillatory laminar (or turbulent) boundary layer above the interface in the free fluid is equivalent to the Poiseuille flows considered in the paper. The boundary layer flow within the permeable material (or seabed) could have significant influence on determining the mass transport velocity under the waves. (Humphreys-ISWS)

THE HYDROLOGICAL RESPONSE OF HEADWATER AND SIDESLOPE AREAS,
Institute of Hydrology, Wallingford (England).
K. Beven
Hydrological Sciences Bulletin, Vol. 23, No. 4, p 419-437, December 1978. 10 fig, 3 tab, 14 ref.

Descriptors: *Basins, *Headwaters, *Rainfall-runoff relationships, Watersheds(Divides), Channels, Storms, Hydrology, Discharge(Water), Peak discharge, Flow, Velocity, *Sideslope areas, Hydrologic response, Convergent headwater, Divergent sideslope.

This paper showed that the hydrological response of convergent headwater and divergent sideslope areas, within a broadly homogeneous basin, may be expected to be significantly different. A field study of 3 headwater and 2 sideslope areas of the order of 0.25 sq km in the Crimple Beck catchment, Yorkshire, England, was described. Spatial variations in gauged rainfall inputs to the sub-basin areas were shown to be small relative to differences in hydrological response. Results from winter and spring storms showed that the headwater areas will generally provide significantly higher and earlier peak flows per unit area and more total storm discharge than the sideslope areas. Areas of surface saturation of the soil are most commonly found during and between storms in convergent hollow areas associated with ephermeral channels, expanding as variable contributing areas of surface flow during storm rainfall. In this basin, however, there was also a tendency for both headwater and sideslope sub-basins to generate surface flow on large areas of saturated soil during storms. Measured unchannelled surface flow velocities were very slow (approximately 20 m/h) and suggested that, in this particular situation, the differences in the response of headwater and sideslope areas may be largely due to the role of the network of minor channels commonly found in convergent headwater areas. These, often ephemeral, channels transmit surface water to the permanent stream network efficiently and rapidly. In the sideslope areas, generally lacking such channels, surface water will be delayed, and may be delayed sufficiently to reinfiltrate before reaching a channel when rainfall ceases. (Lee-ISWS)

EFFECTS OF CHANNEL ENLARGEMENT BY RIVER ICE PROCESSES ON BANKFULL DISCHARGE IN ALBERTA, CANADA,
Calgary Univ. (Alberta). Dept. of Geography.
D. G. Smith.
Water Resources Research, Vol. 15, No. 2, p 469-475, April 1979. 5 fig, 3 tab, 19 ref.

Descriptors: *Channel morphology, *Ice, *Discharge(Water), *Canada, *Australia, *England, *United States, Rivers, Channel flow, Scour, On-site data collections, Analysis, Ice jams, On-site investigations, Frequency, Stream erosion, Ice breakup, Foreign research, Channel enlargement, Bankful discharge.

Results from 24 rivers studied in Alberta showed that bankfull recurrence intervals average 16.7 yr, ranging between 2.4 and 45 yr. These results differ sharply from the average of 1.6 yr for rivers in warmer countries such as Great Britain, Australia, and the United States. The difference in frequency of return period for Alberta rivers may be attributed to channel enlargement caused by the occurrences of scour from ice breakup, drives, and jams of unknown frequencies. The enlarged channel areas (cross sections) at bankfull average 2.6 times larger, but due to comparison adjustments, may be 3 times larger than comparable rivers at bankfull in the United States, and are thus able to carry an average of 4.7 times more discharge, taking into account the increase in velocity. Research is particularly needed on the role of river ice jams and drives in shaping channel geometry. (Humphreys-ISWS)

Water Resources Research, Vol. 15, No. 2, p 347-358, April 1979. 7 fig, 12 tab, 13 ref. NSF GK-41643X.

Descriptors: *Streamflow, *Floods, *Model studies, *Regression analysis, Mathematical models, Flow, Probability, Statistics, Precipitation(Atmospheric), Rainfall, Snowfall, Drainage area, Forests, Soils, Annual flood, Hydrology, Bayesian theory.

Bayesian theory provides for the explicity accounting of both parameter and model uncertainties. It was used in this work to derive a procedure for discriminating among alternative hydrologic regression models. In particular, the procedure was used to discriminate among alternative exogenous variables in regression models. Controlled experiments with hydrologic models were designed to test the proposed procedure under different assumptions on model prior probabilities, length of sample, and model subset. These examples showed that besides its theoretical advantages, the use of the Bayesian procedure unambiguously selects the correct model in most of the applications. (Sims-ISWS)

NATIONAL WATER QUALITY GOALS CANNOT BE ATTAINED WITHOUT MORE ATTENTION TO POLLUTION FROM DIFFUSED OR 'NONPOINT' SOURCES,
General Accounting Office, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-275 290, Price codes: A04 in paper copy, A01 in microfiche. Report to the Congress December 20, 1977, 29 p.

Descriptors: *Pollution abatement, *Water pollution sources, *Water quality, *Water quality control, Pollutants, Political aspects, Water quality standards, Water pollution control, Pollutant identification, Planning, Drainage, Drainage effects.

'Nonpoint' sources of water pollution -- sediment, acid mine drainage pesticides, and other pollutants carried into streams by runoff from rainstorms -- currently produce more than half of the pollutants entering the nation's waterways. If not controlled, nonpoint pollution will prevent attainment of national water quality goals and will continue to grow in significance as 'point' sources of pollution, such as factories and municipal waste treatment plants, are brought under control. Because the source of discharge is diffuse, nonpoint pollution is difficult to collect and treat. The best way to control it is to prevent as much of it as possible from reaching the water through proper land management. The federal Environmental Protection Agency (EPA) should plan more solutions to nonpoint water pollution sources. Because funds for water pollution control are limited, better data is needed to set priorities and evaluate alternatives for controlling water pollution. The EPA agrees that greater nonpoint source control effort is needed at federal, state and local levels. The EPA believes that the present program structure is the best possible, considering the various program constraints. (Fortin-Florida)

GEOTHERMAL ENVIRONMENTAL IMPACT ASSESSMENT: BASELINE DATA FOR FOUR GEOTHERMAL AREAS IN THE UNITED STATES,
Geonomics, Inc., Berkeley, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-295 609, Price codes: A22 in paper copy, A01 in microfiche. Interagency Energy-Environment Research and Development Report No. EPA-600/7-78-188, September 1978. 358 p, 99 fig, 23 tab, 27 ref, 5 append. 68-03-2468.

Descriptors: *Geothermal studies, *Geysers, *Water analysis, *Water chemistry, *Basic data collections, Climactic data, Geology, Hydrology, Seismology, Imperial Valley(California), The Geysers(California), Klamath Falls(Oregon), Rio Grande Rift Zone(New Mexico), Groundwater, Groundwater resources, Groundwater availability, Groundwater basins, Technology, Research and development, Assessment, Thermal water.

A compilation and technical assessment of the existing data on climate, geology, hydrology, water chemistry and seismicity is presented for Imperial Valley and The Geysers in California, Klamath Falls, Oregon, and the Rio Grande Rift Zone, New Mexico. The information is the first step, or baseline data assessment, towards developing an environmental monitoring methodology emphasizing groundwater degradation for geothermal areas. The Imperial Valley, a sediment-filled structural trough undergoing intensive crustal deformation, active faulting, very high seismicity, and significant subsidence, displays high regional heat flow and contains six known geothermal resource areas. A new comprehensive fault map of the valley has resulted from the extensive data compilation. Numerous faults and notable seismic activity occur in the mountainous region of The Geysers. Hydrology and water quality are discussed for mine drainage basins in this region. The geothermal waters occurring in the Klamath Basin appear to be associated with faults and are located in rubbly, fractured basalt aquifers. Four main aquifers are identified in this area which historically has displayed very low seismicity. The Rio Grande Rift Zone, containing seven areas of potential geothermal interest, is difficult to interpret because of complex folding in the mountains and discontinuous faulting throughout. The drainage basins contain much saline water, and the available volume of fresh water varies. (Davison-IPA)

EFFECT OF DRAIN DIAMETER, OPENINGS AND ENVELOPES ON WATER TABLE DRAWDOWN,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
R. W. Skaggs, and Y. K. Tang.
Transactions of the American Society of Agricultural Engineers, Vol. 22, No. 2, p 326-333, March-April 1979. 10 fig, 4 tab, 17 ref.

Descriptors: *Drains, *Drawdown, *Water table, *Mathematical models, *Groundwater movement, Equations, Unsaturated flow, Saturated flow, Drainage systems, Depth, Soil profiles, Hydraulic conductivity, Hydraulic properties, Water levels, Computer models, Richards equations, Parallel drains, Effective radius, Envelopes.

Numerical solutions to the Richards equation for saturated and unsaturated flow to parallel drains were used to determine the effects of drain tube diameter, openings, and envelopes on water table drawdown. Conventional drain tubes with a finite number of openings in the walls were represented as completely open tubes with an effective radius, r sub e. The effect of drain tube size and the use of envelopes on water table drawdown were determined for different soils, drain spacings, and profile depths. It was concluded that envelopes will allow an increase in drain spacing without reducing the design drawdown rate. However, the allowable spacing increase is smaller than previously reported in the literature. The midpoint drawdown rate was found to be relatively insensitive to changes of one or two sizes in the drain tube diameter. Finally, it was shown that the effect of drain tube diameter on drainage rates is dependent on drain spacing and profile depth as well as hydraulic properties of the soil. (Visocky-ISWS)

GROUNDWATER CONTOUR MAPPING IN VENICE BY STOCHASTIC INTERPOLATORS, 1. THEORY,
IBM Scientific Center, Venice (Italy).
G. Gambolati, and G. Volpi.
Water Resources Research, Vol. 15, No. 2, p 281-290, April 1979. 10 fig, 4 tab, 12 ref.

Descriptors: *Groundwater, *Aquifers, *Mapping, *Model studies, Mathematical models, Water levels, Land subsidence, Saline water intrusion, Piezometry, Theoretical analysis, Stochastic processes, Analytical techniques, Hydrology, *Venice(Italy), Kriging techniques.

An adaptation of the kriging technique was developed and used to map the hydraulic head field, z, of three major aquifers underlying the Venetian lagoon. Available records came from a fairly small number of observation wells unevenly scattered across the mainland, Venice, and the littoral. The event to be reconstructed was conceptually idealized as the sum of (1) a deterministic component, m, giving the main trend of z, and (2) a stochastic component, e, giving the natural dispersion of z around m with zero mean, constant variance, and high autocorrelation. Both m and e were dependent on the observation scale. A physically based expression for m was selected, including the consideration of additional information related to the general hydrogeological context. To reduce the complexity of the choice, some unknown coefficients, a sub k, were introduced in m and determined 'a priori' by a best fit technique, for instance, the least squares method. The relationship between m and a sub k was not necessarily linear. The dispersion e was then assessed by a linear optimal stochastic interpolator, i.e., by a linear combination of the observed values with the requirement that the variance of the interpolation error, E, be minimal. Validation of the interpretation models selected for each of the three Venetian aquifers showed that the present approach yields accurate results provided the trend is correctly assessed. Descriptors: *Groundwater, *Aquifers, *Mapping, *Model studies, Mathematical models, Water levels, Land subsidence, Saline water intrusion, Piezometry, Stochastic processes, Analytical techniques, Hydrology, *Venice(Italy), Kriging techniques.

Reliable and flexible tools are required to keep under control the subsurface flow field of the Venetian lagoon and the related land subsidence. One such tool was given by the stochastic interpolator developed in paper 1 and used to map the 1973 and 1977 piezometry of three major Venetian aquifers. A fairly small number of test holes unevenly scattered across the mainland, Venice, and the littorals provided the input data. The output was the reconstructed hydraulic head together with an assessment of its reliability. The 1973 results showed the existence of a pronounced cone of depression centered upon the industrial area of Porto Marghera, which turned out to be by far the major pumping site in the whole area. Local withdrawals produce a minor cone in Venice, but they do not account for the overall head decline recorded there. The 1977 contour maps showed a substantial recovery of the flow field in the upper 250 m of the groundwater basin, thus providing documentary evidence for the recently observed rebound of the land surface. Significant residual withdrawals still occur in the lowest unit (approximate 280 m) of the aquifer system. (See also W79-07559) (Sims-ISWS)

U.S. GEOLOGICAL SURVEY, DENVER, COLORADO, RADIOCARBON DATES II,
Geological Survey, Denver, CO. Water Resources Div.
L. J. Schroder, R. L. Emerson, and W. A. Beetem.
Radiocarbon, Vol 20, No 2, p 200-209, 1978. 2 tab, 4 ref.

Descriptors: *Radioactive dating, *Groundwater, *Carbon radioisotopes, *Alkalinity, Sampling, Water wells, *Carbon-14.

This list includes C-14 measurements made between 1969 and 1973 that represent natural water samples. Calculations of dates are made with the radiocarbon half-life of 5568 + or - 30 years; plus or minus numbers quoted are the standard errors for the counting of radioactive disintegrations. The C-13 values reported are based on Craig PDB limestone standard (Craig, 1957) and were determined by Teledyne Isotopes, Inc., Westwood Laboratories (R, 1968, v 11, p 53-105). The total alkalinity as bicarbonate values reported were determined using techniques described by Brown and others (1970). All dates reported in this list are from water samples collected by members of the U.S. Geological Survey. The measurement of C-14 ages was financed through the Nevada Operations Office, U.S. Energy Research and Development Agency, formerly U.S. Atomic Energy Commission. (Woodard-USGS)

DETERMINATION OF HYDROLOGIC PARAMETERS FOR GLACIAL TILLS IN CONNECTICUT,
Connecticut Univ., Storrs. Inst. of Water Resources.
D. Huntley, and R. B. Black.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 578, Price codes: A02 in paper copy, A01 in microfiche. Research Project Technical Completion Report, 1979. 19 p, 4 tab, 6 fig, 12 ref. OWRT A-077-CONN(2), 14-34-0001-7014.

Descriptors: *Hydrologic properties, *Glacial soils, Hydrogeology, *Transmissivity, Computer model, *Waste disposal, Aquifer characteristics, *Glacial till, *Contaminant transport, *Waste movement, Sanitary landfills, *Anisotropic flow, *Permeameters, Slug tests, Stratified sediments,

Quinebaug River Basin, Shetucket River Basin, Connecticut.

Glacial tills located in the upland areas of the Shetucket and Quinebaug River basins, Connecticut, were evaluated for transmissivity and hydraulic conductivity by performing slug-injection tests on nine, small diameter drilled wells and slug-withdrawal tests on nineteen existing, dug wells. Test data, analyzed using the type-curve method of Cooper et. al. (1967) and Papadopulos et. al. (1973) yielded values of horizontal hydraulic conductivity that ranged from 1.0 to 355 gpd/ft2 (0.13 to 14.46 m/day). Laboratory-determined values of horizontal hydraulic conductivity were obtained using specially-constructed permeameters on relatively undisturbed samples of till. Although grain-size distributions for these samples show a wide range of values, this variability was not reflected in the hydraulic conductivities, which ranged from 13 to 80 gpd/ft2 (0.53 to 3.26 m/day). A computer-model simulation utilizing the permeability contrasts and anisotropic nature of the till indicated that large variations of contaminant transport existed in the hypothetical aquifers when an average horizontal hydraulic conductivity is assumed for the till rather than accounting for high-hydraulic conductivity layers that might exist. Computer-model simulations of waste movement through a till aquifer, such as those presented in this study, have widespread application relative to the design of sanitary landfills and other forms of waste disposal in till and stratified sediments. VARIATIONS IN SPECIFIC YIELD IN THE OUTCROP OF THE CARRIZO SAND IN SOUTH TEXAS AS ESTIMATED BY SEISMIC REFRACTION,
Texas Dept. of Water Resources, Austin.
G. L. Duffin, and G. R. Elder.
Report 229, April 1979. 61 p, 9 fig, 3 tab, 13 ref.

Descriptors: *Sand aquifers, *Seismic studies, *On-site tests, *Texas, Aquifers, Seismic properties, Groundwater resources, Porous media, Groundwater, Seismic waves, Saturated soils, On-site data collections, Methodology, Instrumentation, Testing procedures, Porosity, Aquifer characteristics, Specific yield, Water table aquifers, Zone of saturation, Travel time, Sound waves, Carrizo Sand(TX), Unsaturated zone.

Seismic soundings were made at 84 sites, situated along 20 profiles, on the outcrop of the Carrizo Sand in south Texas. These soundings were made to estimate lateral variations in the aquifer's total porosity and specific yield where the aquifer is under water-table conditions. Compressional wave velocities in the upper unsaturated portion of the aquifer were determined by refraction soundings. Empirical relationships were used to estimate total porosity values from the compressional wave velocities. Estimated specific yields were derived from the estimated total porosities. The porosity values obtained by these empirical methods agree closely with laboratory porosity determinations from core samples taken from 7 of the 84 seismic sounding sites. All of the averaged values for specific yield fall within the range usually specified for unconfined aquifers (5 to 35%). Because of depth limitations of equipment used in the soundings, it is probable that the estimated average specific yields from profiles spanning or nearly spanning the outcrop are more nearly representative of the full thickness of the aquifer than are the specific yields from profiles that parallel the strike. The higher specific yield values are found east of the Frio River and range from 26 to 32%. West of the Frio River, specific yield values range from 16 to 24%. (Humphreys-ISWS)

AN ISOTOPIC STUDY OF GROUNDWATER SEEPAGE IN THE CENTRAL KENTUCKY KARST,
Scottish Research Reactor Centre, East Kilbride.
R. S. Harmon.
Water Resources Research, Vol. 15, No. 2, p 476-480, April 1979. 3 fig, 2 tab, 24 ref.

Descriptors: *Karst hydrology, *Isotope studies, *Seepage, *Kentucky, *Groundwater, On-site investigations, Aquifers, Analytical techniques, On-site tests, On-site data collections, Stable isotopes, Groundwater movement, Flow, Meteoric water, Vadose water caves, *Great Onyx Cave(KY), *Mammoth Cave National Park(KY).

Ratios of 180/160 were determined for meteoric precipitation and vadose seepage at Great Onyx Cave in Mammoth Cave National Park from March through July 1973. Results of this study indicated that (1) the delta 180/dT for precipitation at this site is 0.38 parts per thousand/deg C, (2) short-term fluctuations in the 180/160 ratio of seepage water in the vadose zone above the cave do not affect the oxygen isotopic composition of the speleothem calcite precipitated in the cave, and (3) the residence time of seepage water in the vadose zone is about 2 weeks. From spot sampling of base level springs in November 1972, the isotopic composition of the karst groundwater body is estimated to be about delta 180 = -5.6 parts per thousand and delta D = -40 parts per thousand. JORDAN AQUIFER OF IOWA,
Geological Survey, Iowa City, IA.
P. J. Horick, and W. L. Steinhilber.
Miscellaneous Map Series 6, 1978. 20 ref, 3 maps.

Descriptors: *Aquifers, *Data collections, *Groundwater resources, *Iowa, Groundwater, Water quality, Maps, Geology, Water balance, Hardness(Water), Water properties, Chemical properties, Dissolved solids, Specific capacity, Water wells, Well data, Potentiometric level, Hydraulic properties, Artesian aquifers, *Jordan aquifer(Iowa).

The purpose of this atlas was (1) to define and describe the spatial relations and physical characteristics of the Jordan aquifer, (2) to present information on the occurrence availability, use, and chemical quality of water in the aquifer, and (3) to define and delineate changes in the potentiometric surface of the aquifer. The geohydrologic information was divided into 3 subject headings that were presented on separate atlas sheets--geology, hydrology, and chemical quality. The Jordan aquifer is the most productive water-yielding unit of the Cambrian-Ordovician aquifer system, and is one of the most dependable sources of water supply for large capacity wells in Iowa. The total thickness of the aquifer ranges from about 400 to 450 feet in east-central and southeastern Iowa to about 150 feet or less in western Iowa. The transmissivity of the aquifer is estimated to range from about 500 ft sq/day in the western part of the state to about 5,000 ft sq/day in the northeastern part. (Humphreys-ISWS)

GROUND-WATER DATA FOR MICHIGAN, 1977,
Geological Survey, Lansing, MI. Water Resources Div.
G. C. Huffman.
Geological Survey open-file report 79-332, 1979. 75 p, 5 fig, 3 tab, 101 ref

Descriptors: *Groundwater resources, *Michigan, *Water levels, *Aquifers, *Water quality, Water wells, Water yield, Water utilization, Well data, Hydrogeology, Hydrographs, Water level fluctuations, Water analysis, Chemical analysis.

This report summarizes data on ground-water levels in 157 observation wells, and provides information on water quality, well locations, depths, altitudes, and aquifers that they tap. Tabulated data include extremes of water levels for 1977 and for the period of record. Also tabulated is the pumpage of most major ground-water users in the State and quality data on selected wells sampled during 1975-77. Levels were generally below average in many wells during the year; however, levels returned to near normal by years end. During the year, water levels reached record highs in only 3 wells and dropped to record lows in 31 wells. (Woodard-USGS)
W79-07947

RECORDS OF GROUND-WATER RECHARGE AND DISCHARGE FOR THE EDWARDS AQUIFER IN THE SAN ANTONIO AREA, TEXAS, 1934-77,
Geological Survey, San Antonio, TX. Water Resources Div.
R. W. Maclay, and R. A. Rappmund.
Edwards Underground Water District Bulletin 37, February 1979. 21 p, 3 fig, 5 tab, 35 ref.

Descriptors: *Groundwater recharge, *Aquifers, *Water yield, *Water level fluctuations, Hydrogeology, Maps, Drainage area, Data collections, Sites, Precipitation(Atmospheric), Texas, *San Antonio area, *Edwards aquifer.

The average annual ground-water recharge to the Edwards aquifer in the San Antonio area, Texas, from 1934 through 1977 was about 589,200 acre-feet. A maximum annual recharge of 1,711,200 acre-feet occurred in 1958, and a minimum annual recharge of 43,700 acre-feet occurred in 1956. A maximum annual discharge of 960,900 acre-feet occurred in 1977, and a minimum annual discharge of 388,800 acre-feet occurred in 1955. The maximum annual discharge by wells was 406,800 acre-feet in 1971. In addition to the tables of data, the report contains two maps showing (1) the hydrologic features in the San Antonio area and (2) the drainage basins and data-collection sites. (Woodard-USGS)

NORTHERN GROUNDWATER AND ENGINEERING PROBLEMS RELATED TO GROUNDWATER FLOW,
Department of the Environment, Calgary (Alberta). Hydrology Research Div.
R. O. van Everdingen.
In: Hydrology Research Division, Annual Progress Reports and Short Research Notes, 1977-78. p 21-26, 1979. 2 fig, 7 ref. Environment Canada Inland Waters Directorate, Ottawa, Report Series No. 64. HR 74-2.

Descriptors: *Groundwater, *Groundwater flow, *Instrumentation, *Hydrologic systems, *Engineering, Gages, Pressure measuring instruments, Hydrology, Hydrologic data, On-site investigations, Recharge, Permafrost, Cold regions, Franklin Mountains(Canada), Mahony Lake(Canada), Lac des Bois(Canada).

Progress is summarized for the year 1977 for groundwater flow engineering related problems. Laboratory work was completed at the University of Calgary in determining radioactive and stable isotopes in rain, snow, ground ice, groundwater recharge, spring water evaporites, and precipitates. The on-going study of the frost mounds near Fort Norman involved the use of time lapse photography. Battery operated pressure recorders were installed in the karst areas of Mahony Lake and Lac des Bois to further investigate the hydrologic sys-

ems of these areas. One of the recorders indicated significantly increased recharge rate during June nd July after a rainy period. The frost blister type rost mounds have been described in a field trip uide for the Central Yukon-Alaska field trip of ne Third International Conference on Permafrost. Davison-IPA)

IATHEMATICAL MODELLING OF A WELL IELD, CHATHAM, N. B.,
Department of the Environment, Ottawa (Ontar-o). Hydrology Research Div.
. Vandenberg.
n: Hydrology Research Division, Annual Prog-ess Reports and Short Notes 1977-78. p 90-109, 979. 13 fig, 1 tab, 4 ref. Environment Canada nland Waters Directorate, Ottawa, Report Series lo. 64. HRO 77-2.

Descriptors: *Mathematical models, *Computer nodels, *Aquifer characteristics, *Well data, Saline water intrusion, Pumping, oundaries(Surfaces), Drawdown, Aquifer man-gement, Hydrogeology, Groundwater movement, Groundwater resources, Chatham(New Brunswick anada).

A mathematical model being formulated will be sed to simulate the hydraulic head distribution of ne aquifer supplying water to Chatham, New runswick. Simulation of past, present, and future umping will indicate areas of excessive draw-own and areas subject to future salt water intru-on. The work to date includes the selection of the rea to be modeled, the design of the finite differ-nce grid, and the establishment of boundary con-itions. Representative values of aquifer character-tics have been selected, a stable nonpumping ydraulic-head distribution has been obtained for ne pumping simulations, the history of pumping rom the Chatham well field has been simulated, nd auxiliary routines for data display have been rogrammed. The results of each stage of develop-nent are described, auxiliary programs are exam-ned, and a finite element model of the area to mulate steady-state hydraulic head surfaces is dis-ussed. Using the steady-state concept and the nodel parameters as they are presently set up, it is ossible to generate hydraulic surfaces for other umping schedules or to make changes in the quifer parameters. Design and operation of an infiltrometer system were discussed. Analysis of the infiltrometer data was presented by estimation of the parameters in the Green and Ampt infiltration equation. The procedure for correcting the observed time scale for the initial period of surface nonsaturation was illustrated. The Green and Ampt equation satisfactorily simulates the observed infiltration rate curve. (Visocky-ISWS)

AIR AND WATER MOVEMENT IN POROUS MEDIA: COMPRESSIBILITY EFFECTS,
Griffith Univ., Nathan (Australia). School of Australian Environmental Studies.
J. -Y. Parlange, and D. E. Hill.
Soil Science, Vol. 127, No. 5, p 257-263, May 1979. 2 fig, 1 tab, 14 ref.

Descriptors: *Soil water movement, *Porous media, *Air, *Compressibility, Model studies, Mathematical models, Laboratory tests, Wetting, Soil water, Moisture content, Sands, Soils, Zone of aeration, Infiltration.

This study presented an analysis of air and water movement in a sand column. The analysis took air compressibility into account. The influence of air on water intake was assessed when water content was imposed at the soil surface. When air can move freely ahead of the wetting front, it was found that air compressibility is negligible, but that air movement increases water intake by a small percentage. When air must escape through the sand surface, air compressibility increases water intake by a small percentage, although the overall effect of air movement is to reduce water flow. The results of the theory were illustrated and confirmed from previous experimental observations. (Sims-ISWS)

UNIVERSAL CONSTANTS FOR SCALING THE EXPONENTIAL SOIL WATER DIFFUSIVITY,
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
W. Brutsaert.
Water Resources Research, Vol. 15, No. 2, p 481-483, April 1979. 11 ref.

Descriptors: *Soil water, *Diffusivity, *Equations, *Mathematical models, Model studies, Wetting, Infiltration, Soil water movement, Sorption, Physical properties, Permeability, Transmissivity, Soils, Soil science, Universal constants.

The exponential form of the soil water diffusivity can be scaled either with the wetting front parameter phi sub f = x sub f/t to the 1/2 power or with the sorptivity A sub o = F/t to the 1/2 power; these variables, which arise in the problem of sorption in a dry soil, are x sub f the distance to the wetting front, t the time, and F the infiltrated water volume. It was shown that the three constants used in this scaling are not independent and that only one constant is needed. (Sims-ISWS)

A MONTE CARLO ANALYSIS OF THE HYDROLOGIC EFFECTS OF SPATIAL VARIABILITY OF INFILTRATION,
Science and Education Administration, Fort Collins, CO.
R. E. Smith, and R. H. B. Hebbert.
Water Resources Research, Vol. 15, No. 2, p 419-429, April 1979. 14 fig, 2 tab, 15 ref.

Descriptors: *Infiltration, *Variability, *Model studies, Mathematical models, Spatial distribution, Distribution patterns, Watershds(Basins), Rainfall, Precipitation excess, Ponding, Runoff, Monte Carlo method, Mathematics, Stochastic processes, Hydrology.

Monte Carlo simulation was employed to analyze the effects of random distribution of soil infiltration properties on the hydrologic performance of catchment areas. Soil hydraulic parameters were distributed with log normal distribution as reported from previous field measurements. Although independent sampling units were assumed, a discussion was presented on the nature and effect of spatial dependence. The composite infiltration rate of an area was simply the average, at a particular moment, of the infiltration rate of all points within that area. Rigorous treatment of the topic is a forbidding problem in stochastic differential equations. Monte Carlo simulation was used here to

study the effects of random distribution of soil properties on distribution of ponding time, composite areal rate, and bias due to variability in space. More accurate treatment for watersheds must also consider interaction of various points on the surface by way of overland flow paths. A distributed watershed simulation model was used for this purpose to demonstrate hydrograph biad due to deterministic spatial variability, and from random variation, plus the relation of bias to rainfall rate. An analysis was also made of the partial area contribution in early parts of storm runoff caused solely by random variation in surface soil properties. (Sims-ISWS)

UNSTEADY INTERZONAL FREE SURFACE FLOW IN POROUS MEDIA,
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
J. A. Liggett, and P. L-F. Liu.
Water Resources Research, Vol. 15, No. 2, p 240-246, April 1979. 9 fig, 4 ref, 1 append. NSF ENG77-01479.

Descriptors: *Free surfaces, *Porous media, *Unsteady flow, *Model studies, Mathematical models, Hydraulic models, Permeability, Dams, Embankments, Hydraulics, Drawdown, Flow, Mathematics, Analytical techniques.

The behavior of the free water surface at discontinuities in permeability for steady flow has been known for more than 40 years and has been used in numerical solutions and flow net sketching. The present paper extended that analysis to unsteady flow, primarily for use in numerical solutions. For a rising free surface, the diffraction between zones was given in graphical form. For a falling free surface, (almost) no diffraction solution existed, and the free surface was either horizontal or tangent to the line of discontinuity. However, sharp curvatures may occur in the vicinity of a permeability change, so care must be exercised in extrapolating free surface slopes to neighboring regions. (Sims-ISWS)

THE TRANSPORT AND RESUSPENSION OF SEDIMENTS IN A SHALLOW LAKE,
Aeronautical Research Associates of Princeton, Inc., NJ.
Y. P. Sheng, and W. Lick.
Journal of Geophysical Research, Vol. 84, No. C4, p 1809-1826, April 1979. 24 fig, 1 tab, 32 ref.

Descriptors: *Sediment transport, *Lakes, *Lake Erie, *Great Lakes, Suspended load, Suspended solids, Waves(Water), Hydraulics, Lake sediments, Flow, Equations, Mathematical studies, Model studies, *Sediment resuspension, Sediment models, Wave hindcasting model, Shallow lakes.

The time-dependent flow and dispersion of suspended sediments in the western basin of Lake Erie are being studied by means of numerical models utilizing data from remote-sensing studies and flume experiments. Mechanisms of sediment dispersion included in the models are convection and turbulent diffusion, river loading, gravitational settling, and physical resuspension and deposition at the sediment-water interface. The time-dependent currents were computed by means of a free surface hydrodynamic model. A wave-hindcasting model was used to compute the wave parameters needed for estimation of shear stress generated at the sediment-water interface under given wind conditions. The rate of sediment resuspension as a function of bottom shear stress and sediment properties was based on data from flume experiments using lake sediments. A series of numerical calculations with the models were performed on a two-dimensional lake with a variable bottom representing a transverse cross section of Lake Erie. It was found that wind direction and fetch length can significantly affect the sediment dispersion patterns. The two-dimensional and the three-dimensional models were both used to simulate realistic short-term events in Lake Erie, and the model outputs compared favorably with the synoptic surface sediment dispersion patterns deduced from the multispectral scanner data. THE NATURAL RESOURCES OF AGUA HEDIONDA LAGOON. REPORT NUMBER 16 ON CALIFORNIA COASTAL WETLANDS,
San Diego Univ., CA. Environmental Studies Center.
J. Bradshaw, B. Browning, K. Smith, and J. Speth.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 996, Price codes: A08 in paper copy, A01 in microfiche. Prepared for Fish and Wildlife Service, Washington, D.C., Office of Biological Services, June, 1976. 110 p, 19 fig, 2 tab, 64 ref.

Descriptors: *Lagoons, *California, *Management, Wetlands, Natural resources, Land use, Dual purpose, Industry, Planning, Agua Hedionda Lagoon.

The greatest threat to the present status of the lagoon and its wetland habitats is the continuing pressure for development of the lagoon and its watershed. City zoning plans indicate the lagoon as open space and the periphery as residential, agricultural, and industrial. Use of the outer lagoon is more restricted; the primary use of this area is for a cooling water intake basin for a power plant. A descriptive inventory of the natural resources found on the lagoon is given as well as guidelines for the multiple-use, management, preservation, and enhancement of those resources. (Steiner-Mass)

FOREST SITES, BOG PROCESSES, AND PEATLAND TYPES IN THE GLACIAL LAKE AGASSIZ REGION, MINNESOTA,
Lake States Forest Experiment Station, St. Paul, MN.
M. L. Heinselman.
Ecological Monographs, Vol. 33, No. 4, p 327-373, Autumn 1963. 29 fig, 6 tab, 126 ref.

Descriptors: *Bogs, *Minnesota, Wetlands, Fens, Peat, Distribution patterns, Geomorphology, Classification, Forests, Ecological distribution.

The identity of the patterned bogs and fens of this region was established. Features that clearly mark the Lake Agassiz peatlands as members of the circumboreal group include string bogs (Strangmoor), topographically oriented forest islands, and fields of regularly spaced islands. The decisive influence of water movement patterns on floristics and forest sites was underscored. The key seems to be the degree of isolation from mineral-influenced groundwater. The course of such waters through bogs is often marked by water-track vegetation types. A tentative classification of peatland types is proposed. (Steiner-Mass)

J. M. Steichen, J. E. Garton, and C. E. Rice.
Journal of the American Water Works Association, Vol. 71, No. 4, p 219-225, April 1979. 13 fig, 1 tab, 11 ref. OWRT A-028-OKLA (3), 14-31-0001-4036.

Descriptors: *Destratification, *Lakes, *Water quality, Hypolimnion, Temperature, Water temperature, Oxygen, Dissolved oxygen, Pumping, Equipment, Hydrogen ion concentration, Carbon dioxide, Alkalinity, Biochemical oxygen demand, Conductivity, Plankton, Diatoms, Algae, Biology.

The effectiveness of a modifies axial flow pump on thermal and dissolved oxygen stratification of a selected lake was measured according to physical-chemical and biological data. Mechanical variables--use of the pump with and without the diffuser, using diffusers of different materials, and varying the pitch of the propeller--were assessed to determine the optimum operating conditions for lake destratification. BLACK WATER AND TWO PECULIAR TYPES OF STRATIFICATION IN AN ORGANICALLY LOADED STRIP-MINE LAKE,
Southern Illinois Univ. at Carbondale. Dept. of Zoology.
J. B. Stahl.
Water Research, Vol. 13, No. 5, p 467-471, 1979. 8 fig, 23 ref.

Descriptors: *Strip mine lakes, *Stratification, *Water quality, *Illinois, Surface waters, Lakes, Thermal stratification, Profiles, Iron, Alkalinity, On-site investigations, Sampling, On-site tests, Analysis, Dissolved oxygen, Hydrogen ion concentration, Water temperature, Data collections, *Jackson County(IL), Anoxic zone.

During summer stratification, a strip mine lake in which fish were cultured in floating cages developed black water in its anoxic zone. The blackness

evidently was produced by ferrous sulfide. Two types of black water stratification were observed. In one, the blackness occurred throughout the anoxic zone but was more intense in the upper part, while iron and alkalinity were high throughout this zone. In the second, the black water was confined to a meter-thick stratum within the anoxic zone, and iron and alkalinity were remarkably low except in two strata: the one with black water, and the one at the top of the anoxic zone. It was suggested that both types of stratification were caused by a high rate of sulfide production in the metalimnion. The relatively high temperature there (as compared to the hympolimnion) and the presumably higher concentrations of organic matter and ammonia, resulting from fish food and fish wastes, account for this high rate of sulfide production. Because of sharp oxygen stratification, 2 carbonate-forming processes, photosynthesis and sulfate reduction, occurred in close proximity to each other. In especially calm weather, vertical density currents of stratification. If the second type of stratification could be produced at will, it might be used to improve the quality of strip mine lake water. (Humphreys-ISWS)

SPATIAL VARIABILITY AND UNCERTAINTY IN GROUNDWATER FLOW PARAMETERS: A GEOSTATISTICAL APPROACH,
Ecole Nationale Superieure des Mines de Paris, Fontainebleau (France). Center for Geological Information.
J. P. Delhomme.
Water Resources Research, Vol. 15, No. 2, p 269-280, April 1979. 13 fig, 1 tab, 20 ref.

Descriptors: *Groundwater, *Transmissivity, *Model studies, Mathematical models, Groundwater movement, Distribution patterns, Spatial distribution, Variability, Aquifers, Infiltration, Statistics, Statistical models, Hydrogeology.

A geostatistical approach was proposed for characterizing the uncertainty about the transmissivity field of an aquifer and analyzing its effect on predicted head values. A new methodology was developed which couples conditional simulation and groundwater flow modeling. Conditional simulation was used for generating different two-dimensional transmissivity fields that all have the same spatial variability as the true field and are consistent with the measured T values at well locations. Two case studies were presented in order to illustrate the method, and conclusions were drawn for future investigation. (Sims-ISWS)

VEGETATION OF THE ATLANTIC COASTAL RIDGE OF PALM BEACH COUNTY, FLORIDA,
Florida Atlantic Univ., Boca Raton, Dept. of Biological Sciences.
D. R. Richardson.
Florida Scientist, Vol. 40, No. 4, p 281-330, Fall 1977. 7 fig, 1 tab, 68 ref.

Descriptors: *Coastal plains, *Vegetation, *Distribution patterns, Wetlands, Florida, Drainage, Drainage effects, Succession.

Predrainage vegetational patterns were mapped for the Atlantic Coastal Ridge of Palm Beach County. A detailed analysis of vegetational changes regarding secondary succession was made by selecting specific areas throughout the overall study region. These areas were described by documenting community changes with regard to species composition and community location. A checklist of the vascular flora was made for each selected area. Using the entire coastal strip vegetation maps and specific study sites, generalizations were made regarding plant succession in the major plant communities: Beach, Coastal Strand, Tropical Hammock, Low Hammock, Scrub, Pine latwoods, Wet and Dry Prairies, Mangroves, Swamps, and Freshwater Marshes. Pre-and post-drainage historical and hydrological information was correlated with geological history in order to show how the physical and biological factors affect vegetation. (Steiner-Mass)

BIOLOGICAL PRODUCTION AND NUTRIENT STUDIES OF LAKE CHAMPLAIN,
Vermont Univ., Burlington. Dept. of Zoology.
E. B. Henson, and M. Potash.
Prepared for the International Joint Commission, International Champlain-Richelieu Board, August 1977. 58 p, 6 fig, 17 tab, 38 ref.

Descriptors: *Lake Champlain, *Water levels, *Marsh plants, *Marsh management, Water level fluctuations, Wetlands, Marshes, Freshwater marshes, Nutrients, Nitrogen, Aquatic animals, Reservoir management, Zooplankton, Aquatic plants.

An evaluation was made of the ecological significance of the distribution and abundance of higher plants, algae, zooplankton, and large invertebrates and of the dynamics of the basic nutrients entering, being cycled, and leaving a Lake Champlain wetland. For best growing conditions, water levels should be maintained at about 98.4 feet from late May through June and should not go below 97.4 feet. From July through the remainder of the growing season, the water level should not be reduced below 95.8 feet with 95.1 feet as an absolute minimum. This level permits lateral movement of water through the emergent zone, thus providing needed nutrients, and also maintains an ample submergent-floating zone within the wetland. It is the submergent zone which supports the greatest densities of macroinvertebrates, used for food by fish. Lake levels maintained below 95.1 feet during the winter will serve to kill off much of the aquatic vegetation and cause increased decomposition in the spring and summer, and releasing a greater amount of nutrients into the lake. (Steiner-Mass)

EFFECTS OF SPRING WATER LEVELS ON THE REPRODUCTION OF UPPER RICHELIEU AND MISSISQUOI BAY: NORTHERN PIKE (ESOX LUCIUS L.),
Quebec Univ., Montreal (Canada), Dept. of Biology.
P. Dumont, and R. Fortin.
Prepared for International Joint Commission, International Champlain-Richelieu Board, August 1977. 105 p, 18 fig, 18 tab, 29 ref.

Descriptors: Lake Champlain, *Water levels, *Pikes, *Spawning, Water level fluctuations, Fish management, Lakes, Fish, Fish reproduction, Aquatic habitats, Reservoir management.

Upper Richelieu and Missisquoi Bay floodplain and wetland areas were classified in terms of northern pike spawning and early development potential. All four potential spawning areas begin to be inundated at lake level 98.5 feet and are productive at 100 feet. Good fry production also seems to be related to relatively stable water level conditions for 30-40 days after the lake reaches 98.5 feet and to a gradual drawdown from the peak. If regulation is decided upon, a predictive model based upon air temperature profiles, precipitation, etc., should be elaborated from the historical data available for Lake Champlain. Also, measures should be taken in order to protect all high potential spawning areas from drainage and land fill for development. (Steiner-Mass)

LAKE CHAMPLAIN FISHERIES INVESTIGATION: UNITED STATES WATERS,
New York State Dept. of Environmental Conservation, Albany.
Prepared for the International Joint Commission, International Champlain-Richelieu Board, August 1977 229 p, 11 fig, 5 tab, 211 ref, 7 append.

Descriptors: *Fish reproduction, *Water levels, *Freshwater marshes, *Pike, *Lake Champlain, Wetlands, Spawning, Marshes, Fish management, Lakes, Fish, Reservoir management, Aquatic habitat.

Healthy northern pike populations exist throughout the Lake Champlain wetlands but tend to be more dominant in the low gradient wetlands located near the northern portions of the lake. Flooded terrestrial vegetation such as grasses and grass-brush-tree combinations and aquatic emergents appeared as the preferred substrate for spawning. Water levels above 30.0 during the spawning period were the minimum levels required for access to and flooding of vegetative types necessary for egg deposition. If lake level regulation is implemented, inundation of this habitat for a duration of 40-50 days at least once every three years would potentially insure egg and fry survival. Dropping of water levels to avoid flooding during the critical egg and spawning period would have an adverse affect on northern pike production. Reduction of lake elevations from 31.0 to 29.5 m would eliminate approximately 42% of the 37,500 mapped wetlands now existing. (Steiner-Mass)

IRRIGATED CORN YIELD RESPONSE TO WATER,
Southwestern Great Plains Research Center, Bushland, TX.
J. T. Musick, and D. A. Dusek.
Paper No. 78-2557, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, 1978, Chicago, Illinois. 26 p, 8 fig, 3 tab, 16 ref. ASAE, St, Joseph, Michigan.

Descriptors: *Irrigation efficiency, Crop response, Moisture deficit, Evapotranspiration, Moisture stress, *Corn, Water requirements, Yield equations, Growth stages.

Corn grain yield response to water deficits and seasonal evapotranspiration-yield relationships were determined during a 3-yr study in the Southern High Plains. Sensitivity of yields and water-use efficiencies to plant-water stress indicated that limited irrigation should not be practiced in the high-evaporative demand climate. (Skogerboe-Colorado State).

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, p 461-476, Proceedings Paper 14574, May 1979. 12 fig, 14 ref, 2 append.

Descriptors: *Mathematical models, *Diffusion, *Sedimentation, Sediment transport, Estuaries, Suspended load, Dredging, Diffusion, Hydraulics, Model studies, Rivers, Equations, River morphology, River geometry, Diffusion-convection equation, Sediment diffusion.

A mathematical model for suspended sediment transport was described. The model enables the investigation of certain effects of river works or geometrical changes, or both, in a river or estuary by morphological computations. The model is based on the two-dimensional diffusion-convection equation. This equation describes the distribution of the sediment concentrations in a two-dimensional flow field by diffusion and convection. For the local velocities in the vertical, the logarithmic distribution was used, while for the sediment diffusion coefficient a new expression was applied. The diffusion-convection equation was solved by an implicit numerical method using a coordinate transformation, while the influence of the diffusion coefficient on the adaptation of the transport in the case of an overcapacity of sediment was presented. A dimensionless graph of the adaptation length of a uniform concentration vertical was given. The application of the model for tidal flow was described, and for such conditions a prototype verification and a sensitivity analysis were given. The model is limited to situations with relatively small changes in lateral direction and nongraded bed. (Lee-ISWS)

COMPARTMENTED SEDIMENT TRAP,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
P. J. Murphy, and M. I. Amin.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Proceedings Paper 14577, p 489-500, May 1979. 9 fig, 1 tab, 9 ref, 2 append.

Descriptors: *Bed load, *Sediments, *Sediment transport, Trap efficiency, Instrumentation, Streambeds, Measurements, Hydraulics, Equipment, Rivers, Streams, On-site investigations, Mathematical studies, Particle size, Compartmented sediment trap.

A method for measuring sediment transport was presented. The measurement device is a portable, compartmented, bottom trap that is operated by burying the trap in the stream bed, waiting until the natural bedforms are reestablished, and then opening the trap during a time interval sufficient to collect a large number of moving particles. The sections of the trap allow the calculation of the fractions of the sediment that jump various lengths as they move along the bed. The jump-length distribution permits the direct calculation of the efficiency of the trap for the various grain sizes of the moving sediment. The compartmented trap was field tested in a sand-bottomed creek

DISCRETE DYNAMIC MODEL OF WATERSHED SEDIMENT YIELD,
Govind Ballabh Pant Univ. of Agriculture and Technology, Pantnagar (India).
T. C. Sharma, and W. T. Dickinson.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Proceedings Paper 14592, p 555-571, May 1979. 6 fig, 10 tab, 11 ref, 1 append.

Descriptors: *Sediment yield, *Watersheds(Basins), *Model studies, *Mathematical models, Rainfall, Runoff, Suspended solids, Sediments, Bed load, Regression analysis, Statistics, Statistical models, Erosion, Soil erosion, Pollutants, Path of pollutants, Streams, Streamflow, Sedimentation.

The watershed fluvial system was hypothesized as a lumped system with runoff rate (log-transformed) as input and sediment yield rate (log-transformed) as output on a discrete time basis. The effects of errors in sampling, data reduction, discretizing, etc., of input and output sequences were simulated by another linear system to which input is a white noise. A first-order dynamic model with 5 parameters was demonstrated to provide an adequate model of monthly runoff-sediment yield process. A second-order dynamic model with 7 parameters adequately models the daily runoff sediment yield process. The noise component was found to be a white noise sequence in both cases, explaining 10% to 19% of the variance in the monthly sediment yields and 3% to 5% of the variance in the daily sediment yields. A linear linkage model explains 81% to 90% of the variance in the monthly sediment yields and 95% to 97% of the variance in daily sediment yields. (Sims-ISWS)

Nature, Vol. 278, p 161-163, 8 March 1979. 3 fig, 1 tab, 9 ref.

Descriptors: *Sediment transport, *Sediment yield, *Suspended load, *Rivers, *Fluvial sediments, Peru, Brazil, *Amazon River, Rio Negro, Rio Madeira.

In late May and early June 1977, suspended-sediment transport rates in the Amazon mainstem ranged from 1.4 to 1.7 x 10 to the 6th power metric tons per day in lower Peru and upper Brazil to 4.7 x 10 to the 6th power metric tons per day at Obidos in lower Brazil. Combining these data with data collected earlier allows us to calculate a new estimate of 8 to 9 x 10 to the 8th power metric tons for the mean annual suspended-sediment discharge at Obidos. SEDIMENT TRAPS IN CHANNELS--DESIGN PROCEDURES AND PERFORMANCE,
Soil Conservation Service, East Lansing, MI.
G. R. Konwinski.
Paper No. 78-2561, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, 1978, Chicago, Illinois, 6 p. 2 fig. ASAE, St. Joseph, Michigan.

Descriptors: *Sediment control, Stream erosion, *Channel erosion, Stream stabilization, Trap efficiency, Bed load, Energy dissipation, Channel flow, Design data.

The design and maintenance of sediment traps to control a stream's energy play a key role in ensuring uniform cross-sectional area in trapezoidal channels. It was suggested that the bedload and the upland must be carefully analyzed to determine the critical energy level which is the first step in the design of a successful in-channel sediment trap. The procedure provided design data needed to proportion the sediment trap to trap bedload sediments by reducing flow velocity through the trap. (Skogerboe-Colorado State)

SEDIMENT TRANSPORT BY IRRIGATION RETURN FLOWS, ON THE YAKIMA INDIAN RESERVATION, WASHINGTON 1975 AND 1976 IRRIGATION SEASONS,
Geological Survey, Tacoma, WA. Water Resources Div.
L. M. Nelson.
Geological Survey open-file report 78-947, 1979. 42 p, 5 fig, 4 tab, 9 ref.

Descriptors: *Sediment transport, *Irrigation water, *Runoff, *Sediment yield, *Discharge(Water), Data collections, Turbidity, Temperature, *Yakim Indian Reservation(Wash).

As determined from data collected at 10 sites on the Yakima Indian Reservation, Wash., during the 1975 and 1976 irrigation seasons (April-September), seasonal sediment discharges in irrigation return flows ranged from 11,000 tons from Marion Drain and Satus Drain 302 to 400 tons from Coulee Drain. There was little variation between the sediment discharges of the 1975 and 1976 irrigation seasons except those from Satus Drain 302. Due to the lack of natural runoff during those seasons, no distinction could be made between sediment discharges from irrigated and nonirrigated areas. No significant or usable relationships were found between suspend-sediment concentration and concurrent water turbidity or discharges. (Woodard-USGS)

2K. Chemical Processes

CHEMICAL CHARACTERISTICS OF SMALL STREAMS NEAR HANEY IN SOUTHWESTERN BRITISH COLUMBIA,
British Columbia Univ., Vancouver. Faculty of Forestry.
M. C. Feller, and J. P. Kimmins.
Water Resources Research, Vol. 15, No. 2, p 247-258, April 1979. 4 fig, 6 tab, 64 ref.

Descriptors: *Water chemistry, *Forest watersheds, *Water quality, *Canada, Forests, Streams, Streamflow, Chemicals, Nutrients, Sampling, Chemical analysis, Storm runoff, Temperature, Water temperature, Sediments, Suspended solids, Evapotranspiration, Water balance, Chemistry, *British Columbia.

The hydrological, thermal, and chemical characteristics of two small streams flowing through relatively undisturbed, low-elevation mountain watersheds in southwestern British Columbia were investigated. All observations and chemical analyses of ecosystems were consistent with the hypothesis that stormflow originated mainly from flow of water through soil macrochannels to groundwater and thence to streams. Water budgets indicated unmeasured groundwater losses. The streams exhibited annual chemical cycles for most parameters, with maximum values in late summer and early autumn and minimum values in winter and early spring. Nitrate concentrations displayed no consistent seasonal variation, whereas potassium and sulphate concentrations were relatively uniform throughout the year. Most chemical parameters decreased with increasing discharge, whereas dissolved oxygen concentrations increased. Potassium concentrations exhibited some increases and some decreases, and chloride, nitrate, and sulphate concentrations were generally not significantly related to discharge. Concentration-discharge relationships were used to infer the origin of stormflow water. Differences in the chemistry of the two very similar streams have important ramifications for the design of watershed nutrient studies. Nutrient budgets were very similar to those of other watersheds in humid temperate regions, with net losses of calcium, sodium, magnesium, potassium, chloride, and sulphur. Nitrogen and phosphorus exports in dissolved or particulate organic form were not measured. Based on dissolved inorganic measurements, nitrogen was accumulated, while any gains or losses of phosphorus were extremely small. (Sims-ISWS)

TEMPERATURE AND PH AS LIMITING FACTORS IN LOSS OF NITRATE FROM SATURATED ATLANTIC COASTAL PLAIN SOILS,
North Carolina State Univ. at Raleigh. Dept. of Soil Science.
J. W. Gilliam, and R. P. Gambrell.
Journal of Environmental Quality, Vol. 7, No. 4, p 526-532, October-December, 1978. 5 fig, 2 tab, 35 ref. OWRT A-083-NC (4), 14-34-0001-7070.

Descriptors: *Nitrates, Reduction(Chemical), *Denitrification, Nitrogen, Groundwater, Atlantic Coastal Plain.

Nitrate reduction rates under water-saturated conditions were determined for two acid Atlantic Coastal Plain topsoils and their acid subsoils at 5, 15, and 25C. Nitrate reduction readily occurred in subsoils even at pH values of 4.5 when an energy source was added. It was concluded that the acid pH values which commonly occur in Atlantic Coastal Plain soils are not a serious limiting factor in NO3(-) reduction. It was also concluded that the temperatures of 5 to 15C which exist in the shallow groundwater of the Atlantic Coastal Plain soils during much of the winter limits the rate of NO3(-) reduction and nitrate reduction can occur in these soils at 5C but the rate is relatively slow and is highly dependent upon the amount of available C. A significant amount of NO3(-) reduction was expected during the winter in poorly drained soils which contain relatively high organic matter contents. (Skogerboe-Colorado State)

TRACE AND TOXIC METAL UPTAKE BY MARSH PLANTS AS AFFECTED BY EH, PH, AND SALINITY,
Louisiana State Univ., Baton Rouge. Center for Wetlands Resources.
D. W. Patrick, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A050 914, Price codes: A07 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi Technical Report D-77-40, December 1977. 124 p, 58 tab, 75 ref.

Descriptors: *Marsh plants, *Metals, *Plant growth substances, Grasses, Salinity, Hydrogen ion concentration, Copper, Lead, Plant growth, Toxins, Biochemistry, Trace elements.

Reasonably successful methods were developed for growing salt marsh plants under conditions of controlled pH, redox potential, and salinity to determine the effects of these physiochemical conditions in the rooting medium on trace and toxic metal availability to plants. Plant cadmium content responded more to change in the physiochemical environment of the rooting medium than did other metals studied. The cadmium content of aboveground was consistently and substantially increased with an increase in oxidation conditions in all species. Maximum cadmium content occurred under acid, oxidizing conditions except for one species in which an oxidized, weakly alkaline environment was favorable. An increase in soil oxidation-reduction conditions increased plant lead content, but this was attributed to a redox potential mediated effect on soil pH. Zinc content was found to increase with increasing oxidation conditions. There was little effect of either pH or oxidation-reduction conditions on the copper content of the species studied. (Steiner-Mass)

NUTRIENT DYNAMICS OF FRESHWATER RIVERINE MARSHES AND THE ROLE OF EMERGENT MACROPHYTES,
Oak Ridge National Lab., TN.
J. M. Klopatek.
Available from the National Technical Information Service, Springfield, VA 22161 as CONF 770248-1, Price codes: A03 in paper copy, A01 in microfiche. 1977. 30 p, 9 fig, 5 tab, 78 ref.

Descriptors: *Freshwater marsh, *Cycling nutrients, *Rooted aquatic plants, *Marsh plants, Wisconsin, Wetlands, Aquatic environment, Soil-water-plant relationships, Aquatic plants, Drawdown, Nutrients, Phosphorus, Potassium, Nitrogen, Calcium, Magnesium, Bullrushes, Cattails, Willow trees.

Inundated and anaerobic soils of a freshwater riverine marsh show significant seasonal variations in available P and K and exchangeable Ca and Mg. Based primarily on investigations in Wisconsin, the role of emergent macrophytes within the marsh nutrient cycle is described. Concentrations of N, P, K, Ca, and Mg follow predictable trends over the growing season. However, the accumulation of these elements in the below and aboveground structures is shown to yield a more complete picture of the functional role of emergent macrophytes. Regression analyses showed nutrient uptake by the macrophytes was significantly correlated to total soil N and available P. Significant correlations were not shown for the other elements and is explained based upon their mobility and the possibility of luxury uptake. Models of the flow of nutrients in a Scirpus fluviatilis stand are depicted. The effects of a marsh drawdown on the nutrient cycle are also discussed as well as the nutrient dynamics of Salix interior, a typical riverine community shrub. (Bollinger-Mass)

NUTRIENT RELATIONSHIPS IN THE DETRITUS OF A TROPICAL SWAMP,
Makerere Univ., Kampala (Uganda). Dept. of Botany.
J. J. Gaudet.
Archives Hydrobiologia, Vol. 78, No. 2, p 213-239, August 1976. 8 fig, 13 tab, 32 ref, 1 append.

Descriptors: *Swamp, *Detritus, *Cycling nutrients, Africa, Tropic, Wetlands, Sedimentation, Leaching, Streamflow, Waste assimilation capacity, Water analyses, Water chemistry, Nutrients, Nitrogen, Phosphorus, Potassium, Sodium, Calcium, Magnesium, Iron, Manganese, Chloride, Fluoride, Sulphur.

The various components in a papyrus swamp (Cyperus papyrus L.) are defined and illustrated using a swamp in Uganda as an example. The components including inputs and outputs were analyzed for N, P, K, Na, Ca, Mg, Fe, Mn, S, Cl, and F. Mineral elements can be: (1) immobilized by incorporation into plant material, (2) returned to the mat water by rain leaching, elution or decomposition, (3) or exported in the particulate material which becomes peat and sludge. However, all nutrients entering the swamp are eventually trapped in the bottom as sludge. Thus, papyrus swamps might be

better visualized as large holding tanks or septic tanks (rather than filters) in which a large amount of autochthonous organic matter is produced and settled out. The fate of nutrients in the detritus components thus make these components most important in nutrient cycling in these African swamps. (Bollinger-Mass)

MAP SHOWING GENERAL QUALITY OF GROUND WATER IN THE KAIPAROWITS COAL-BASIN AREA, UTAH,
Geological Survey, Salt Lake City, UT. Water Resources Div.
D. Price.
Available from Branch of Distribution, USGS Box 25286, Fed. Ctr. Denver CO 80225 price $1.50. Geological Survey Miscellaneous Investigations Series Map I-1033-A, 1977. 1 sheet.

Descriptors: *Water quality, *Maps, *Groundwater, *Water wells, *Springs, Aquifers, Salinity, Utah, *Kaiparowits coal-basin area.

This is one of a series of maps that describe the geology and related natural resources in the Kaiparowits coal-basin area. Chemical analyses of water from about 40 widely scattered springs, 20 coal-exploration holes on the Kaiparowits Plateau, and 7 water wells in the vicinity of the communities of Escalante and Glen Canyon were used to compile this map. All the water samples were from depths of less than 1,000 feet. Water-quality data were also available from a number of petroleum wells and exploration holes more than 5,000 feet deep. Ground water in most parts of the Kaiparowits coal-basin area ranges from fresh to slightly saline. In general, the fresh waters are of the calcium bicarbonate type, and the saline water are of the sodium sulfate type. The available chemical analyses indicate that the ground water is generally freshest throughout the headwater areas of the Escalante River, along Cottonwood and Hackberry Canyons, and in the immediate vicinity of Lake Powell. In these areas, the springs sampled commonly contained less than 500 mg/L of dissolved solids. The ground water is generally most highly saline along the southern margin of the Kaiparowits Plateau and in the northeast corner of the study area. (Woodard-USGS)

THE COASTLINE,
John Wiley and Sons, New York, R. S. K. Barnes (Ed.), 1977. 356 p, 99 fig, 27 tab, 721 ref.

Descriptors: *Coasts, *Wetlands, *Shores, *Land management, Salt marshes, Estuaries, Coastal marshes, Coastal plains, Marsh management, Shore protection, Drainage.

This book has been divided into a series of sections, each covering one fairly uniform group of habitats--sandy foreshores, rocky cliffs, salt marshes, estuaries, etc. The common structural plan of the chapters is: first, a summary of the fundamental ecological and geomorphological processes operating in the environment in question; second, the special features of the environment in terms of ecology and characteristic pressures; third, methods of study; fourth, educational, scientific, recreational, or economic uses of the environment; and fifth, recommended conservation and management policies, including international case studies of success or failure studies. General introductory and concluding chapters are included to place the individual habitats in a wider perspective. (See W79-07718 thru W79-07722) (Steiner-Mass)

THE COASTLINE,
Saint Catharine's Coll., Cambridge (England). Dept. of Zoology.
R. S. K. Barnes.
In the Coastline, p 3-27, 1977. Barnes, R. S. K. (ed.). John Wiley and Sons, New York.

Descriptors: *Coasts, *Salt marshes, *Accretion, Wetlands, Coastal marshes, Coastal plains, Marsh management, Shores, Shore protection, Land management, Erosion.

The position of a coastline can be considered as the result of the operation of three independent factors: continental drift, relative land-sea level, and the local characteristics of the rate of erosion or accretion resulting from subaerial, fluviatile, or marine processes. Taking a coastline as a whole, erosion is occurring along a much greater length than is accretion. Accretion mainly occurs in the comparatively quiet waters of estuaries, semi-enclosed bays, and natural harbors. The effect of organisms in promoting accretion is large. Without salt-marsh plants, there would be little natural land reclamation and without dune grasses there would be few dune coastal sand dunes protecting the hinterland from tidal inundation. Change in the vertical height of a marsh surface (brought about by accretion) will affect the frequency of tidal cover and therefore the accretion rate. As a marsh increases in height, the accretion rate will first accelerate as the plant cover becomes more complete and comparatively bushy species succeed smaller ones, but it will decrease when tidal cover becomes infrequent. The other major activity determining the shape and position of the land-water boundary is the behavior of man, particularly in his roles as a reclaimer of land and a protector of coastlines. W79-07718

LAGOONS,
Ferrara Univ. (Italy). Inst. of Zoology and General Biology.
G. Colombo.
In the Coastline, p 63-81, 1977. Barnes, R. S. K. (ed.). John Wiley and Sons, New York.

Descriptors: *Lagoons, *Preservation, *Lake morphometry, Bays, Wetlands, Development, Conservation, Distribution, Land use, Land reclamation.

Lagoons are shallow bodies of brackish or sea water partially separated from an adjacent coastal sea by barriers of sand or shingle, which only leave narrow openings through which sea water can flow. In general, lagoons are associated with coastlines which have experienced or are experiencing change in the relative land-sea level. A lagoon will evolve either towards total isolation behind a complete sediment barrier, and thence from a coastal pond to swamp and marsh, or into a coastal bay again after erosion of the barrier. Besides the natural evolutionary trends, human activities often affect the structure of lagoons, primarily by hydraulic works, but also by land-reclamation schemes and through changes in the inland watershed. A lagoon is a comparatively simple system and has less homeostatic controls than most other systems; it is therefore comparatively easy to disturb, although it is not too difficult to preserve it in a moderately good condition. In many cases, ecological and hydrological investigation of a lagoon before specific projects are initiated will allow estimates to be made of the likely future evolution of the system and of its susceptibility to deteriorative changes. W79-07719

MUDDY FORESHORES,
Nature Conservancy Council, Hampshire (England).
C. R. Tubbs.
In the Coastline, p 83-92, 1977. Barnes, R. S. K. (ed.). John Wiley and Sons, New York.

Descriptors: *Mud flats, *Marsh management, *Shores, Coasts, Wetlands, Preservation, Conservation, Shore protection, Land management, Sediments, Mud, Mud-water interfaces, Tidal effects.

Mud flats are formed by the deposition of fine inorganic material and organic debris in particulate form, which has been held in suspension in the sea or in estuaries. Deposition tends to occur where the turbulence of the sea is most abated and the gradient of the underlying land is slight. In sheltered situations the deposits accumulate to form extensive, level or gently sloping expanses drained by networks of deeply incised channels, some formed by the flood tide and some by the ebb. The process of accretion over level expanses of mud leads naturally to the development of salt marshes, notably where the silt content is high and there is minimal tidal scour. The rapid spread of Spartina marsh since the 1870's has involved a substantial reduction in the total mud flat resource of northwest Europe and this in turn has greatly reduced the areas available to waders and waterfowl as feeding grounds. The reclamation of mud flats for grazing and arable land has occurred widely in the past. Today there is a likelihood of a significant proportion of the remaining mud land resource becoming lost to industry, water storage, and sewage effluent. (See also W79-07717) (Steiner-Mass)
W79-07720

SALT-MARSHES,
Delta Inst. of Hydrobiological Research, Yerseke (Netherlands).
W. G. Beeftink.
In the Coastline, p 93-121, 1977. Barnes, R. S. K. (ed.). John Wiley and Sons, New York.

Descriptors: *Salt marshes, *Marsh management, *Land reclamation, Wetlands, Marshes, Coastal marshes, Tidal marshes, Coasts, Drainage effects, Land use, Grazing, Sewage effluent, Geomorphology, Hydrogeology, Water pollution.

In temperate regions, salt marshes are found in and around river mouths, bays, Wadden areas, lagoons, and on coastal plains protected by sand- and shingle-spits. During marsh genesis, sedimentation of clay and silt takes place especially in the basins whilst coarser particles are deposited on the creek banks. The most common marsh use is grazing--usually by sheep, cows, and horses. Although mostly limited to the higher marshes and coastal dune-slacks, grazing may take up vast areas. Grazing includes selective cutting and removal of plant parts, local manuring, and trampling of the vegetation. The latter also leads to compaction of the topsoil, and, more intensified, to destruction of the turf-layer. Drainage of marshes is also another form of land reclamation. It results in a lowering of the water table and thus in changes in habitat, flora, and fauna. Transversing with ditches is harmful to the geomorphological development, for the natural watercourses may lose their function. Embankment is one of the most serious impacts on salt marshes. In industrialized areas, marshes are threatened by a complex array of man-made detritus, litter, and chemical substances derived from agricultural wastes, fertilizer or trash, urban sewage, and industrial effluents. (See also W79-07717) (Steiner-Mass)
W79-07721

ESTUARIES,
University Coll. of Swansea (Wales). Dept. of Botany.
A. Nelson-Smith.
In: The Coastline, p 123-146, 1977. Barnes, R. S. K. (ed.). John Wiley and Sons, New York.

Descriptors: *Estuaries, *Water pollution effects, *Management, Primary productivity, Water pollution, Sewage effluents, Organic matter, Oil wastes, Pesticide residues, Wastes, Chemical wastes.

The outstanding feature of estuaries is the high productivity which results from the constant supply of nutrients to a sheltered but dynamic habitat. Estuaries and tidal marshes are regarded as amongst the most fertile natural areas in the world--being up to seven times as productive as a typical wheat field and 20 times more than the open sea. Primary production probably lies in the region of 500 g of organic matter per square meter per annum. Physical pollution in estuaries often exaggerate conditions which are already present to some extent. Particulate wastes create turbidity and may damage gills when suspended, or blanket the bottom and may smother plants and sessile animals when settled. Organic waste decomposition may deplete the oxygen supply. Large discharges of sewage and industrial effluent may represent a sizable addition of fresh water. Oil pollution may depress photosynthesis in plants and bring about the faulty development of animal larvae, deter the more sensitive or delicate amongst mobile animals, and weaken those which are sedentary. W79-07722

PETROLEUM INDUSTRY IN THE DELAWARE ESTUARY,
Academy of Natural Sciences of Philadelphia, PA.
R. Patrick, and W. Whipple.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 962, Price codes: A19 in paper copy, A01 in microfiche. January 1977. 440 p.

Descriptors: *Oil industry, *Toxicity, *Delaware River, Oil wastes, Estuaries, Delaware, Industry wastes, Oily water, Shellfish, Economic costs, Fish, Marine animals.

A comprehensive evaluation was made of all of the sources of petroleum in the Delaware Estuary, including the finding that urban runoff and other unrecorded sources constitute a major part of the total land. Investigations of toxicity of petroleum and its products and derivatives to fish, shellfish, and other organisms have revealed that toxicity to most, but not all, immature organisms is greater than that to adults, that petroleum on sediments is much more toxic to oysters than petroleum dissolved in the water column, and chronic and life cycle studies show very much greater toxicity than the acute bioassay tests which are usually relied upon. Ultraviolet irradiation of No. 2 fuel oil and Iranian crude greatly increases their toxicity. The tracing of effects of a major spill indicates that mechanisms of transport may involve sediment-resuspension relationships which greatly modify relationships derived from previous hydrodynamic transport modeling. Economic, social, and institutional aspects are also covered. (Steiner-Mass)

NATURAL RESOURCES OF COASTAL WETLANDS IN NORTHERN SANTA BARBARA COUNTY,
San Diego State Univ., CA. Center for Regional Environmental Studies.
C. R. Mahrdt, T. A. Oberbauer, J. P. Rieger, J. R. Verfaillie, and B. M. Browning.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 994, Price codes: A06 in paper copy, A01 in microfiche. Prepared for Fish and Wildlife Service, Washington, D.C., Office of Biological Services, Coastal Wetland Series No. 14, May 1976. 99 p, 12 fig, 1 tab, 45 ref, 7 append.

Descriptors: *Coastal marshes, *Natural resources, *Management, *Ecology, *Assessments, *California, Habitats, Ecosystems, Wetlands, Aquatic habitats, Estuaries, Estuarine environment, Tidal marshes, Land management, Land resources, Land use, Evaluation, Wildlife, Amphibians, Reptiles, Mammals, Birds, Fish, Invertebrates, Vegetation.

A one-year ecological assessment of Vandenberg Air Force Base was made to obtain baseline data on southern California coastal natural resource systems. Five major wetland systems are contained within the 35-mile coastline. Descriptions of the areas and their resources are given along with uses of the resources. Problems and conflicts of use are identified. Present management of the area is evaluated and recommendations made that will protect and enhance the natural resources of the coastal wetlands of northern Santa Barbara County. (Bollinger-Mass)
W79-07728

THE NATURAL RESOURCES OF CARPINTERIA MARSH, THEIR STATUS AND FUTURE. REPORT NUMBER 13 ON CALIFORNIA COASTAL WETLANDS,
California Univ., Santa Barbara. Marine Science Inst.
K. B. MacDonald.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 993, Price codes: A06 in paper copy, A01 in microfiche. Prepared for Fish and Wildlife Service, Washington, D.C., Office of Biological Services, March 1976. 69 p, 11 fig, 1 tab, 41 ref.

Descriptors: *Marsh management, *Natural resources, *Wildlife habitat, Marshes, *California, Resource development, Land use, Planning, Water pollution, Coastal marshes, Aquatic habitats, Wetlands, Carpinteria Marsh.

The natural resources of Carpinteria Marsh are documented and the uses that those resources receive are outlined. The problems and conflicts that affect the resources are enumerated and measures are recommended that will protect and enhance the marsh and its resources. It is intended as a guide for citizens, planners, and administrators. (Steiner-Mass)
W79-07729

THE NATURAL RESOURCES OF THE NIPOMO DUNES AND WETLANDS. REPORT NUMBER 15 ON CALIFORNIA COASTAL WETLANDS,
California State Dept. of Fish and Game, Sacramento.
K. A. Smith, J. W. Speth, and B. M. Browning.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 995, Price codes: A07 in paper copy, A01 in microfiche. Prepared for Fish and Wildlife Service, Washington, D.C., Office of Biological Services, June 1976. 106 p, 9 fig, 86 ref, 6 append.

Descriptors: *Coastal marshes, *Nipomo dunes, *Conservation, Wetlands, Salt marshes, Dunes, Lagoons, *California, Marshes, Natural resources, Marsh management, Land use.

Documented are the natural resources of an 18-square mile section of the coastal wetlands and dunes in southern San Luis Obispo and northern Santa Barbara counties. Also identified are the uses those resources receive, the problems affecting them, and recommendations for their conservation. The report is intended as a guide for planners, administrators, and all others concerned with the conservation of the area. (Steiner-Mass)
W79-07730

THE NATURAL RESOURCES OF MUGU LAGOON. REPORT NUMBER 17 ON CALIFORNIA COASTAL WETLANDS,
California Univ., Santa Barbara. Marine Science Inst.
K. B. MacDonald.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 997, Price codes: A09 in paper copy, A01 in microfiche. Prepared for Fish and Wildlife Service, Office of Biological Sciences, Washington, D.C., June, 1976. 119 p, 10 fig, 108 ref, 9 append.

Descriptors: *Wetlands, *California, *Marsh management, Lagoons, Natural resources, Land use, Water pollution, Conservation, Coastal marshes, Mugu Lagoon.

The purpose of this report is to document the natural resources of Mugu Lagoon, describe the uses that those resources receive, enumerate the problems that affect them, and recommend measures that will maintain and enhance the wetland. It is intended as a guide to those responsible for resource maintenance of the Lagoon as well as to provide information to those interested in the status and future of the lagoon. Existing and potential problems include: the restriction of tidal flow in the western lagoon arm by existing and/or planned roadways, possible overuse of the site by scientists and disruption of the natural lagoon community by introduced species. Other potential problems that may affect the future of the wetlands largely relate to off-site developments. These problems can be grouped into four categories: water pollution, sedimentation and flood control problems related to Calleguas Creek watershed; increasing urbanization of the agricultural lands surrounding the lagoons; increasing pressure for public recreational access; and a lack of coordinated management efforts. (Steiner-Mass)
W79-07732

THE NATURAL RESOURCES OF ANAHEIM BAY--HUNTINGTON HARBOUR. REPORT NUMBER 18 ON CALIFORNIA COASTAL WETLANDS,
California State Dept. of Fish and Game, Sacramento.
J. W. Speth, B. M. Browning, and K. A. Smith.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 998, Price codes: A07 in paper copy, A01 in microfiche. Prepared for Fish and Wildlife Service, Washington, D.C., Office of Biological Services, August 1976. 103 p, 9 fig, 3 tab, 57 ref, 9 append.

Descriptors: *Marshes, *Anaheim Bay, *Marsh management, Wetlands, Salt marshes, Natural resources, Management, Land use, Industry, Planning, Water pollution, Dredging, Conservation, Wildlife habitat, Coasts.

All of the area's wetlands are in public ownership and thereby relatively protected from further developments. However, the indirect impact of development and other disturbances within the drainage area is a primary threat. To preserve and protect the remaining wetlands, and to help reestablish some of the wetland system, it is recommended that: dredging and filling except for harbor maintenance and wildlife habitat improvement, be prohibited, and lands adjacent to the eastern and northern boundaries of the wildlife refuge be designated for future addition to the refuge, A program of marsh restoration be instituted to allow tidal waters to flow unrestricted over all lands capable of being flooded within the station boundaries, the western island of Sunset Aquatic Regional Park be dedicated in its entirety to fish and wildlife use, Aeration devices be constructed in strategic locations of Huntington Harbour to assure survival of marine life during periods of low dissolved oxygen levels, and the existing problem of floating trash entering the Anaheim Bay marsh be investigated and a workable solution be determined and implemented. HYDROCHEMICAL EVIDENCE OF SEA WATER INTRUSION ALONG THE MAN-

GROL-CHORWAD COAST OF SAURASHTRA, GUJARAT,
Physical Research Lab., Ahmedabad (India).
B. I. Desai, S. K. Gupta, M. V. Shah, and S. C. Sharma.
Hydrological Sciences Bulletin, Vol. 24, No. 1, p 71-82, March 1979. 6 fig, 3 tab, 11 ref.

Descriptors: *Saline water intrusion, *Coasts, *Hydrogeology, *Water quality, Sea water, Salinity, Groundwater, Aquifers, On-site investigations, Chemical properties, Stratigraphy, Conductivity, Calcium, Sodium, On-site data collections, Foreign research, *India, *Gujarat State(India).

The rapid increase in the salinity of groundwater in the Mangrol-Chorwad area of coastal Saurashtra has been reported during the last decade. The geohydrological and chemical data of the principal aquifers in the region were examined with a view to ascertaining the cause of the increasing salinity in the groundwater of the region. It was shown that the field data are consistent with a simplified model in which limited amounts of sea water enter the limestone aquifer and the Na(+) from the mixed solution exchanges with the Ca(2+) in the aquifer matrix through the base exchange phenomenon. 3A. Saline Water Conversion

HIGH FLUX PBI REVERSE OSMOSIS MEMBRANES FOR DESALINATION AND WATER REUSE,
Celanese Research Co., Summit, NJ.
M. Tan, and H. J. Davis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 285, Price codes: A04 in paper copy, A01 in microfiche. Final Report, November 1978. 53 p, 15 fig, 16 tab. OWRT (No. 7527) (1), 14-34-0001-7527.

Descriptors: *Reverse osmosis, *Permselective membranes, Membranes processes, Desalination, Plastics, Polybenzimidazole.

High flux, high rejection flat polybenzimidazole (PBI) reverse osmosis membranes were prepared. Membrane film casting and processing parameters were first identified and optimized in small-scale laboratory film casting trials. On the basis of these thickness results, membranes measuring 12 in. by 36 in. and 2.5 mils in thickness were prepared and evaluated in long-term testing at 600 psi and 400 psi with non-chlorinated and chlorinated salt solutions. Two prototype spiral wound modules were fabricated for demonstration purposes. Membrane samples were tested in high pressure test cells against 5000 ppm salt solutions. In long-term testing, a decline in flux was observed, presumably the result of pressure induced compaction. Salt rejection remained high or improved slightly with time. In long-term testing against salt solutions containing 10 ppm chlorine, reduced water flux was observed after 1000 hours. Salt rejection remained well over 90%. The flux decline was attributed, in part, to membrane fouling and compaction.

3B. Water Yield Improvement

PROJECT SKYWATER: FISCAL YEARS 1975-78 REPORT.
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
Progress Report March 1979. 177 p, 15 fig, 12 ref, 4 append.

Descriptors: *Weather modification, *Cloud seeding, *Artificial precipitation, *Meteorology, Forecasting, Instrumentation, Environmental effects, Ecology, Social impact, Cloud physics, Hydrology, Ecosystems, Rainfall, Rainfall-runoff relationships, Model studies, Water resources development, Colorado River Basin, Orography, Contracts, Projects, Research and development.

Research conducted during the fiscal years 1975-1978 under the Bureau of Reclamation's precipitation management program is summarized. During this period the project was characterized by increasingly intensive efforts to reduce scientific uncertainty about the way in which precipitation develops and how science might influence the process beneficially. Project and contract summaries are presented for the Colorado River Basin Pilot Project, the High Plains Cooperative Program, the Sierra Cooperative Pilot Project, and the Colorado River Basin Program which is in preliminary planning. Contracts devoted to general orographic studies are summarized. The equipment developed in support of general atmospheric research, but not connected with any particular project, is described. Summaries are presented of several Project Skywater in-house investigations which explored the problems and concepts relevant to precipitation enhancement technology. (Davison-IPA)

MINIMIZING THE SALT BURDEN OF IRRIGATION DRAINAGE WATER IN THE PECOS VALLEY OF NEW MEXICO,
New Mexico State Univ., Las Cruces. Dept. of Agronomy.
G. A. O'Connor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 599, Price codes: A03 in paper copy, A01 in microfiche. New Mexico Water Research Institute Report No. 105, 1979, 41 p, 10 fig, 7 tab, 21 ref. OWRT A-056-NMEX(2), 14-34-0001-7066.

Descriptors: *Irrigation practices, *Management, *Leaching, Salt balance, Drainage, Soil management, Salts, Leachate, Pecos River Valley, New Mexico.

The purpose was to evaluate the potential of minimized leaching management techniques under Pecos Valley, New Mexico conditions. The objectives were to determine the applicability of the U.S. Salinity Laboratory (USSL) computer model to New Mexico conditions, the effect of minimized leaching on soil and water properties, and the effect of minimized leaching on yield of a crop common to the Pecos Valley. Results show that the Pecos River Valley is ideally suited for minimized leaching management. Minimized leaching reduced the volume of water required for irrigation and also the volume and salt burden of drainage water without detrimentally affecting soil chemical and physical properties or crop yield. The USSL chemical computer model was applicable to Pecos Valley conditions and could be used to make long-term projections of actual field conditions resulting from a minimized leaching management program. SECURING AGRICULTURAL LAND FOR WASTEWATER IRRIGATION,
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 776, Price codes: A07 in paper copy, A01 in microfiche. Report, 1977. 135 p, 5 fig, 18 tab, 45 ref, 3 append.

Descriptors: *Return flow, *Irrigation, *Agriculture, *Legal aspects, *Irrigation programs, Waste water disposal, Water reuse, Economics, Evaluation, Reservoir storage, Dairy industry, Application methods, Waste water treatment, Municipal wastes.

An examination of land application of waste water from Petaluma, California, to agricultural land for irrigation included an investigation of methods for obtaining land for waste water disposal. The agricultural irrigation plan was considered to provide wastewater disposal and more efficient use of available water resources, provide long-term preservation of open space, and maintain a dairy industry by supplying locally grown fodder crops. Two potential areas for waste water irrigation were identified to the east and to the southeast of the city. One irrigation plan considered would dispose of treated effluent on fields in the summer and discharge waste water to the Petaluma River in the winter; this procedure would require about 1,400 acres. The second configuration would transfer waste water from the treatment plant to a reservoir where it would be contained in winter and distributed to agricultural fields in summer; this alternative would require about 3,800 acres. The legal interests in the land analyzed included: fee simple, lease, easement, development rights, license, covenant running with the land, contract, option for future needs, and right of first refusal; fee simple, lease, and easement were considered to have the most potential. A series of purchasing and leasing arrangements for securing land for waste water irrigation were then evaluated. (Lisk-FRC)

Journal of the American Water Works Association, Vol. 71, No. 4, p 204-209, April 1979. 3 fig, 7 tab, 5 ref. OWRT B-035-WYO (4), 14-34-0001-7201.

Descriptors: *Lawns, *Water demand, *Water conservation, *Wyoming, Municipal water, On-site investigations, On-site data collections, Data processing, Evapotranspiration, Soil water, Grasses, Water utilization, Water users, Irrigation, Rates of application, Sprinkling, Sprinkler irrigations, Optimization, *Lawn watering.

It is known that lawn watering comprises a relatively large percentage of municipal water use, but few data exist on individual home lawn water application rates with respect to the esthetic appearance of lawns. This study showed that an esthetically pleasing lawn can be achieved with an average water application rate equal to or less than the seasonal evapotranspiration rate. A homeowner education program was advocated to promote self-rationing during water-short periods. (Sims-ISWS)

LEVEL-BASIN IRRIGATION: A METHOD FOR CONSERVING WATER AND LABOR,
Science and Education Administration, Phoenix, AZ. Water Conservation Lab.
L. J. Eric, and A. R. Dedrick.
Available from U.S.G.P.O., Washington, D.C., Stock No. 001-000-03912-1. Farmers Bulletin No. 2261, April 1979. 23, 17 fig, 2 tab.

Descriptors: *Irrigation systems, *Irrigation design, *Irrigation effects, *Irrigation efficiency, Irrigation operation and maintenance, Irrigation engineering, Surface irrigation, Turnouts, Maintenance, Hydraulic gates, Outlets, Erosion control, Level-basin irrigation.

Level-basin irrigation, a gravity method whereby water is supplied to level soil surfaces over a short period of time, involves application of water to a level area of any shape surrounded by a control barrier such as a dike. Water applied to basins over a short period of time is confined until absorbed by the soil. This type of system has many characteristics which can result in high irrigation efficiency, and offers advantages over other more commonly used techniques. These advantages include: minimizing of deep percolation, application efficiencies above 90% on fine textured soils, natural leaching of salts, is adaptable to automation and to furrows as well as flatbed crops, and large streams of water can be utilized, thereby reducing irrigation time and labor requirements. The limitations of this method include: the difficulty of precision leveling necessary for even water distribution, ascertaining the correct amount of water, the amount of land leveled is limited by the depth of topsoil, and elaborate erosion control measures may be required with the use of a large stream. The basic principles and design in land preparation are set forth, and evaluations of two field trials are discussed. Gates and outlet structures, cultural practices, and management are examined. Diagrams of field plans are provided. (Davison-IPA)

DIGITAL CONTROLLER FOR TRICKLE IRRIGATION,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
D. D. Fangmeier, and J. D. Busman.
Paper No. 78-2547, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, Palmer House Hotel, Chicago, Illinois, 7 p, 5 fig, 1 tab, 5 ref. ASAE, St. Joseph, Michigan.

Descriptors: *Control systems, Irrigation systems, Water conservation, Electronic equipment, Evaporation, Soil moisture, Moisture tension, Timing, Consumptive use, Application equipment, *Trickle irrigation.

A digital controller was designed using complementary metal oxide semiconductor electronics. The controller uses measured evaporation pan depths and soil moisture tensions to determine the time required to apply the desired quantity of water on a daily basis. Circuit diagrams for major components were presented. (Skogerboe-Colorado State)

ELECTRONIC TIMERS FOR AUTOMATED SURFACE IRRIGATION SYSTEMS,
Science and Education Administration, Kimberly, ID. Snake River Conservation Research Center.
H. D. Fisher, A. S. Humpherys, and R. V. Worstell.
Paper No. 78-2544, Presented at the 1978 Winter Meeting of the American Society of Agricultural Engineers, December 18-20, 1978, Chicago, Illinois, 7 p. 3 fig, 5 ref. ASAE, St. Joseph, Michigan.

Descriptors: Surface irrigation, Automatic control, *Control systems, Automation, Timing, Electronic equipment, Instrumentation, *Furrow irrigation, Irrigation systems.

Electronic timers were developed to replace alarm clocks and mechanical timers for semiautomated irrigation structures and valves. Timer-controllers including a micro-processor unit were designed for a field tested with automatic cutback, buried lateral and multiset furrow irrigation systems. (Skogerboe--Colorado State)

A COMPUTER SIMULATION OF SOIL WATER DISTRIBUTION USING THE PULSED DRIP IRRIGATION METHOD AT LOW AND HIGH DISCHARGE RATES ON A SANDY SOIL,
Fruit and Fruit Technology Research Inst., Stellenbosch (South Africa).
F. C. Van Rooyen, P. C. Van Rooyen, and I. Levin.
Water S. A., Vol. 5, No. 1, p 44-56, January 1979. 10 fig, 1 tab, 7 ref.

Descriptors: *Irrigation, *Computer models, *Irrigation effects, *Irrigation efficiency, *Irrigation programs, *Sands, Soil physical properties, Soil water movement, Soil-water-plant relationships, Equations, Mathematical studies, Rates of application, Water spreading, Water distribution, Percolation, Evapotranspiration, Water loss.

A regic sand typical of large areas of the western cape of South Africa was used with a previously verified computer simulation model to study continuous and pulsed drip irrigation rates with respect to vertical and horizontal soil water distribution. Pulsed and continuous irrigation application rates of 1.5 l/hour, 3 l/hour and 9 l/hour were simulated, and a total of 12 l of water was added in each case. All applications were simulated up to a time of 24 hours which included varying time intervals of redistribution after terminating water application. Calculations of soil water distribution were made using a two-dimensional water transport model expanded to include salt. The method for solving the flow equation is presented. The calculations were performed with a FORTRAN program and executed on a Burroughs 7700 computer. The studies showed that the differences between pulsed and continuously applied drip irrigation decreased with increasing discharge rate. For regic sand a 3 l/hour pulsed irrigation yielded the same results as 1.5 l/hour continuously applied with regard to deep percolation losses below 0.6m deep. Differences between pulsed and continuous application were insignificant for this soil at a discharge rate of 9 l/hour. The results showed that a 3 l/hour pulse treatment would be the most suitable where a peak water consumption of 20 to 40 l/plant was determined. (Davison-IPA)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

A RESERVOIR OPERATING MODEL WITH INORGANIC QUALITY CONSTRAINTS FOR THE TRUCKEE RIVER,
Boyle Engineering Corp., Las Vegas, NV.; and Nevada Univ. System, Las Vegas Desert Research Inst.
T. D. Chiatovich, and J. W. Fordham.
Water Resources Bulletin, Vol. 15, No. 2, p 301-315, April 1979. 4 fig, 1 tab, 5 ref. OWRT (No. 5216) C-6157 (1), 14-31-0001-5216.

Descriptors: *Reservoir operation, *Water quality, *Low-flow augmentation, *Computer models, *Simulation analysis, *Optimization, Evaluation, Feasibility, Standards, Digital computers, Dynamic programming, Reservoir releases, Constraints,

Downstream, Water demand, River basins, Decision making, Systems analysis, Truckee River(Cal Nev), Inorganic, Iterative process, Worth maximization, Costs.

Investigated was low-flow augmentation as a means of meeting inorganic water quality standards for the Truckee River at the California-Nevada state line. A digital inorganic water quality model was combined with a deterministic dynamic reservoir operating model in an iterative process which allowed the optimization of releases subject to selected inorganic water quality constraints as well as downstream demands. The water quality model was a modification of a previously developed chemical water quality model for the Truckee River; estimates of the chemical quality of unregulated inflows or gains to the main river channel were made using regression equations exponentially relating quality and flow. The reservoir operating model was a deterministic dynamic programming model whose objective function was to maximize the total worth of releases considering water quality constraints as well as downstream water demands. Results from model runs with varied flow and river loading data have indicated that flow augmentation may be a feasible and relatively inexpensive way of meeting standards for this system, except in time of severe drought. RHYTHMIC SPACING AND ORIGIN OF POOLS AND RIFFLES,
California Univ., Santa Barbara. Dept. of Geological Sciences.
E. A. Keller, and W. N. Melhorn.
Geological Society of America Bulletin, Vol. 89, p 723-730, May 1978. 12 fig, 4 tab, Doc. No. 80509. OWRT B-089-NC (7) and A-021-IND (6), 14-34-0001-6103.

Descriptors: *Pools, *Riffles, Alluvial stream channels, Stream improvement, Stream stabilization, Meanders, Stream alignment, Fluvial geomorphology.

Quantitative analysis of the spacing of pools in bedrock and alluvial stream channels in California, Indiana, Virginia, and North Carolina suggest that the tendency for streams to meander in the vertical (or third) dimension, as in the horizontal plane, is a fundamental characteristic of many streams that is independent of material type. Simple linear-regression and correlation models reveal that approximately 70% of the variability of the spacing of pools can be explained by the variability of channel width. Analysis of the spacing of 251 pools in eleven streams, utilizing the Kolmogorov-Smirnov goodness of fit test and one-way analysis of variance suggests that the hypothesis that the data from bedrock and alluvial channels are from the same population cannot be rejected at the 0.05 level of significance. Morphologic maps and field observations of stream channels incised in sandstone, limestone, metavolcanic rock, and syenite suggest that although these streams have much in common with alluvial stream channels, there exist considerable differences in certain aspects of channel morphology. This results because bedrock control of morphology locally may be more significant than the effects of general processes that tend to produce rhythmic channel forms such as pools and riffles. However, local controls tend to mask rather than destroy the effects of more general processes that produce the third dimension of meandering streams. (Kiger-North Carolina)

POOLS, RIFFLES, AND CHANNELIZATION,
California Univ., Santa Barbara. Dept. of Geological Sciences.
E. A. Keller.
Environmental Geology, Vol. 2, No. 2, p 119-127, 1978. 6 fig, 3 tab, 22 ref. OWRT B-089-NC (6), 14-34-0001-6103.

Descriptors: *Channel improvement, Geomorphology, Channel morphology, Channelization, Channel erosion, Stream improvement, Stream stabilization, Urban streams.

The addition of regularly spaced deeps (pools) and shallows (riffles) that provide a variety of flow conditions, areal sorting of stream-bed material, cover for wildlife, and a positive aesthetic experience, may be desirable in many channel projects. Such designs will reduce adverse environmental impacts of stream channel modifications. Analysis of variance for pool-to-pool spacing data suggests that there is no significant difference with respect to channel width between pools that form in natural streams and those in streams affected by a variety of human uses. Short of channelization, which changes the channel width, pools and riffles, within limits are not particularly sensitive to environmental stress. Experiments in Gum Branch near Charlotte, North Carolina, support the hypothesis that channel form and process evolve in harmony and that manipulation of cross-channel morphology can influence the development of desired channel processes. Planned manipulation of its channel form induced Gum Branch to develop as desired. Morphologic stability consisting of incipient point bars, pools, and riffles was maintained over a period of high magnitude flood events, only to be degraded later by a wave of sediment derived from upstream construction and stream-bank failures. Thus, environmentally desirable channel morphology in urban streams cannot remain stable if changes in the sediment load or storm-water runoff exceed the limits of the stream's ability to make internal adjustments while maintaining morphologic stability. (Kiger-North Carolina)

CONSERVATION DISTRICTS AND 208 WATER QUALITY MANAGEMENT-NON-POINT SOURCE IDENTIFICATION AND ASSESSMENT, SELECTION OF BEST MANAGEMENT PRACTICES, MANAGEMENT AGENCIES, REGULATORY PROGRAMS,
National Association of Conservation Districts, Washington, DC.
W. B. Davey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 411, Price codes: A16 in paper copy, A01 in microfiche. June, 1977, 349 p.

Descriptors: *Environmental control, *Water pollution control, *Water management(Applied), *Regulation, Pollutant identification, Pollution abatement, Erosion, Farm wastes, Federal water pollution control act, Feed lots, Soil conservation.

In its various issuances the federal Environmental Protection Agency (EPA) has recognized that: (1) The basic approach to non-point source pollution control is prevention, and (2) Local entities such as conservation districts should assume a leading role in planning and implementing the programs. Potential conservation district involvement in the preparation and implementation of state and areawide water quality management plans is developed pursuant to Section 208 of the 1972 Federal Water Pollution Control Act Amendments (P.L. 92-500). The non-point pollution source aspects of erosion and sediment control, animal waste management (organics), and irrigation water management (salts) are emphasized. The preparation of management plans is included which EPA indicates should be directed to meet two principal mandates of the Act: (1) The determination of effluent limitations needed to meet applicable water quality standards, including the requirement to at least maintain existing water quality (Section 303); and (2) Development of state and areawide management programs to implement abatement measures for all pollutants sources. (Vloedman-Florida)

WATER RIGHT LAWS AS THEY AFFECT LAND ACQUISITION AND CONSTRUCTION,
Montana State Univ., Bozeman. Center for Interdisciplinary Studies.
C. C. Bowman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 901, Price codes: A03 in paper copy, A01 in microfiche. Report No. NSF-RA-E-74-095, January, 1974, 36 p.

Descriptors: *Water law, *Legislation, *Water rights, *Land development, Regulation, Recreation facilities, Land use, Environmental effects, Regional development, Water users.

This report is divided into three sections. The first presents the customs, laws and federal-state relationships which must be considered when acquiring land and water for recreational facilities. Guidelines are provided for the search to be conducted, to determine the feasibility of water supply and the responsibilities relevant to water and ditch rights. The histories of United States and Montana Water Law are presented including court decisions and existing laws. The second study examines important factors involving water balance, water rights, ditch rights and authority over water, which must be considered before land is purchased, leased or acquired for recreational development. The third part discusses the Gallatin Canyon water rights study. Research objectives include: (1) studying the surface water laws governing water use; (2) determining the existing surface water usage on the Gallatin River above Spanish Creek; (3) determining which governmental agency has the final authority over such waters; (4) determining to necessary studies and procedures required before a recreational area and the supporting commercial facilities can be developed. (Vloedman-Florida)

PROBLEMS AFFECTING USEFULNESS OF THE NATIONAL WATER ASSESSMENT WATER RESOURCES COUNCIL,
General Accounting Office, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 257, Price codes: A02 in paper copy, A01 in microfiche. March 23, 1977, 16 p.

Descriptors: *Water resources planning act, *Water requirements, *Water resources, Assessments, Water management, Use rates, Water districts, Data collections, Water users, Regulation, Water demand.

The 1965 Water Resources Planning Act (Act) require the Water Resources Council (Council) to prepare an assessment biennially, or less frequently as the Council may determine of the adequacy of water supplies necessary to meet the requirements in each United States water resource region. Results are presented of a General Accounting Office (GAO) review of the Water Resources Council's efforts to develop a national water assessment pursuant to section 102 of the Act. Problems came to the GAO's attention which raised doubts about the reliability and usefulness of the 1975 assessment, Federal, State and regional agencies were unable to resolve discrepancies in the water data for base year 1975. Steps should be taken to make the final assessment document more responsive to the needs of the intended user agencies. Before undertaking future assessments, the Council should reappraise the project's objectives and the methodology of developing an adequate national water data base. (Vloedman-Florida)

4B. Groundwater Management

CONNECTOR WELL EXPERIMENT TO RECHARGE THE FLORIDAN AQUIFER, EAST ORANGE COUNTY, FLORIDA,

Geological Survey, Tallahassee, FL. Water Resources Div.
P. W. Bush.
Geological Survey Water-Resources Investigations 78-73 (open-file report), 1979. 40 p, 18 fig, 1 tab, 10 ref.

Descriptors: *Artificial recharge, *Aquifers, *Groundwater recharge, *Orifices, *Aquicludes, Drilling, Transmissivity, Methodology, Aquifer characteristics, Evaluation, Florida, *Floridan aquifer, *Connector wells.

An experimental connector well, screened in the shallow sand aquifer, finished with open hole in the Floridan aquifer, and cased through the confining layer between the two aquifers, was drilled in east Orange County, Florida, to obtain information on the nature and function of the shallow aquifer as related to connector well operation. The potentiometric surface of the shallow aquifer is about 45 feet higher than the potentiometric surface of the Floridan aquifer; hence water flows by gravity from the shallow aquifer to the Floridan aquifer through the well 'connecting' the two aquifers. Continuous flow measurement over 10 months shows the well discharge varies seasonally and averages slightly more than 50 gallons per minute. Observation wells show that, except for seasonal variation water levels within the area of influence have reached steady state within measurable limits. Vertical anisotrophy in the shallow aquifer is apparently caused by the shape and (or) arrangement of the sand grains that comprise the shallow aquifer, rather than distinct confining layers of different lithology. Transmissivity of the shallow aquifer at the site is about 600 square feet per day. Extensive dewatering of wetlands in east Orange County by connector wells alone is probably not feasible. Nevertheless, large amounts of water could be channeled to the Floridan aquifer by connector wells. The results of the connector well experiment imply that water is being captured from evapotranspiration and runoff in the vicinity of the connector well. (Woodard-USGS)

MAP SHOWING GENERAL AVAILABILITY OF GROUND WATER IN THE KAIPAROWITS COAL-BASIN AREA, UTAH,
Geological Survey, Salt Lake City, UT. Water Resources Div.
D. Price.
Available from Branch of Distribution, USGS Box 25286, Fed. Ctr. Denver CO 80225 price $1.50. Geological Survey Miscellaneous Investigations Series Map I-1033-B, 1977. 1 sheet.

Descriptors: *Groundwater availability, *Hydrogeology, *Maps, *Aquifer characteristics, *Water levels, Water quality, Water yield, Utah, *Kaiparowits coal-basin area.

This is one of a series of maps that describe the geology and related natural resources of the Kaiparowits coal-basin area, Utah. The map is based partly on records of water wells, springs, and coal and petroleum-exploration holes, partly on unpublished reports of field evaluations of prospective stock-water well sites by personnel of the U.S. Geological Survey, and partly on a 6-day field reconnaissance by the writer. Rocks ranging in age from Permian to Holocene are exposed in the Kaiparowits coal-basin area. They consist chiefly of sedimentary rocks--mostly interbedded sandstone, siltstone, shale, conglomerate, and limestone strata--in aggregate a thickness of several thousand feet. The minimum expected yields of individual wells shown on the map assume that the wells are at least 6 inches in diameter; fully penetrate the aquifer; either have no casing, perforated casing, or well screens opposite the aquifer; and are equipped with optimal pumping equipment. The yields shown are those that could be sustained indefinitely by pumping. The ranges of expected depth to ground water shown on the map are based on measured and reported depths of water in wells. Yields of most springs range from less than 1 to about 20 gallons per minute, but several springs discharge more than 100 gallons per minute. Much of the ground water (including springflow) may be too saline to drink. (Woodard-USGS)

USE OF STORM-WATER BASINS FOR ARTIFICIAL RECHARGE WITH RECLAIMED WATER, NASSAU COUNTY, LONG ISLAND, NEW YORK--A HYDRAULIC FEASIBILITY STUDY,
Geological Survey, Syosset, NY. Water Resources Div.
D. A. Aronson, T. E. Reilly, and A. W. Harbaugh.
Long Island Water Resources Bulletin 11, 1979. 57 p, 17 fig, 9 tab, 24 ref.

Descriptors: *Groundwater recharge, *Artificial recharge, *Reclaimed water, *Storm runoff, *Infiltration, Model studies, Methodology, Computer models, Simulation analysis, Watersheds(Basins), Control drainage, Water table, *Long Island(NY), Dual-purpose basins.

A survey of 205 storm-water basins in Nassau County, N.Y. shows that 14 of the 50 largest basins would be suitable for dual infiltration of reclaimed water and storm runoff. Each basin would be divided by an earthern partition so that half would be used for storm-water retention, the other half for reclaimed water. The 14 basins together could accommodate 38.6 million gallons per day of reclaimed water at infiltration rates as high as 0.28 feet per hour, which is approximately 20 percent of the basins' theoretical maximum infiltration capacity. However, the basins cannot accommodate the amounts needed to offset the ground-water deficit predicted for the 1990's in Nassau County. The tendency of certain basins to overflow during large-magnitude storms could be reduced by enlarging the basins to accommodate excess runoff, lowering the height of the dividing partition, diverting excess runoff to another basin, or temporarily halting inflow of reclaimed water. The regional water-table rise that would result from artificial recharge at the 14 selected basins would partly offset the decline in the water table and in streamflow caused by sewering in parts of Nassau and Suffolk Counties. (Woodard-USGS)
W79-07948

CHANGES IN VEGETATION DIVERSITY CAUSED BY ARTIFICIAL RECHARGE,
Geological Survey, Tucson, AZ. Water Resources Div.
T. E. A. van Hylckama.
Vegetatio, Vol. 39, No. 1, p 53-57, 1979. 3 fig, 2 tab, 16 ref.

Descriptors: *Plant groupings, *Artificial recharge, *Ecotypes, *Distribution patterns, *Recharge ponds, Balance of nature, Grasslands, Pre-impoundment, Post-impoundment, *Lubbock(TEX), *Zandvoort(Netherlands), Plant sociology, Plant taxonomy.

Efforts to increase the rate of artificial recharge through basins often necessitates scraping and ditching before and during operations. Such operations can result in more or less drastic changes in vegetation (depending on what was there before), characterized by diminished numbers of species and lowered diversity. Two examples, one from the Netherlands and one from Texas are presented showing how similar treatments cause similar changes in two completely different plant societies. (Woodard-USGS)
W79-07951

MODELLING SUBSURFACE IRRIGATION RETURN FLOW,
Department of the Environment, Ottawa (Ontario). Hydrology Research Div.
S. R. Singh.
In: Hydrology Research Division, Annual Progress Reports and Short Research Notes, 1977-78, p 62-67, 1979. 1 fig, 3 ref. Environment Canada Inland Waters Directorate, Ottawa, Report Series No. 64. HR 76-4.

Descriptors: *Groundwater recharge, *Mathematical models, *Irrigation, Soil-water-plant relationships, Drainage effects, Irrigation methods, Aquifers, Equations, Computer programs, Computer models, Simulation analysis, Subsurface irrigation, Subsurface flow, Groundwater flow.

A study was conducted to (1) develop a mathematical model for predicting groundwater recharge from irrigation taking into account the soil-plant-atmosphere interactions and the methods of irrigation; (2) develop an aquifer simulation model for quantitative analysis of groundwater flow toward the drainage facilities; and (3) validate the models through the use of the soil moisture and groundwater data collected at the Irrigation Experiment Project in Alberta. Models were developed separately for different components and then connected in a computer program. The differential equation of groundwater flow through an inhomogeneous, unconfined, two-dimensional aquifer is presented along with the solution procedure. This solution procedure completes the development of a finite element model for simulating two-dimensional, transient-free surface groundwater flow through actual acquifers. The temporal distribution of subsurface irrigation return flow, subject to different rates of groundwater recharge resulting from sprinkler or surface flooding irrigation, can be predicted with this model. (Davison-IPA)

HYDROGEOLOGY OF IRRIGATION RETURN FLOW,
Department of the Environment, Ottawa (Ontario). Hydrology Research Div.
A. Vandenberg.
In: Hydrology Research Division, Annual Progress Reports and Short Notes, 1977-78, p 68-80, 1979. 4 fig, 3 tab, 2 ref. Environment Canada Inland Waters Directorate, Ottawa, Report Series No. 64. HR 77-1.

Descriptors: *Hydrology, *Irrigation effects, *Hydrogeology, *Groundwater recharge, *Piezometers, Groundwater flow, Measurement, Instrumentation, Testing, On-site tests, Bedrock, Groundwater barriers, Infiltration, Irrigation water, Vauxhall(Alberta, Canada), Oldman

River(Alberta, Canada), Bow River(Alberta, Canada).

During 1977 the first phase of the project to be completed involved the drilling, logging and testing of two 122 m test holes to obtain preliminary information on subsurface geology and groundwater conditions. Seven piezometer nests, each having three piezometers were installed in the test holes. The regional hydrogeology and the geologic setting of the Vauxhall irrigation return flow study area in southeastern Alberta are described. The second phase of the field work included infiltration and limited pump tests on each piezometer. A sand and gravel layer within the surface deposits encountered at all piezometer nest locations appears to be continuous over the area, and occurs at the same distance above the surface of the bedrock The drillhole information indicates that the bedrock divide lies to the north of the topographic divide. If this is the case, groundwater seepage would tend to be diverted along the surface of the bedrock towards the Oldman River instead of toward the Bow. The estimates of permeability for the strata around the tips of the piezometers are based on the results of both the long-term infiltration and the short-term pumping tests. The permeability values presented are indicative of the relative permeability for the different strata; they are not absolute values. (Davison-IPA)

HARBOR LINES AND THE PUBLIC TRUST DOCTRINE IN WASHINGTON NAVIGABLE WATERS,
Washington Univ., Seattle. School of Law.
R. W. Johnson, and E. M. Cooney.
Washington Law Review, Vol. 54, No. 2, p 275-314, 1979.

Descriptors: *Shore protection, *Washington, *Legislation, Regulation, Water law, Water management, Water policy, Harbors, Coastal engineering, Zoning.

Since 1971, the Shoreline Management Act has been the dominant legal tool for managing the Washington coastal zone. However, use of state-owned beds of navigable fresh and salt waters below low tide or the low-water line are still controlled by the harbor line system established in the 1889 state constitution. The relationship of the harbor line system to the Shoreline Management Act, to the various federal laws concerned with the coastal zone, and to the public trust doctrine are analyzed. The origin, development, and operation of the system in Washington are described. Federal and state legislation and court opinions concerned with the problem of controlling uses of navigable waters and beds in Washington are surveyed. These laws and decisions have: (1) preserved water surfaces and beds for water-related uses by curbing filling and construction; (2) protected the environmental and aesthetic qualities of these areas; (3) developed priorities for future uses; and (4) established governmental regulatory systems for controlling development and activities. Washington's Harbor Line System and comments on the Seattle central waterfront controversy are also examined. (Vloedman-Florida)

4D. Watershed Protection

A FINITE-ELEMENT MODEL OF OVERLAND AND CHANNEL FLOW FOR ASSESSING THE HYDROLOGIC IMPACT OF LAND-USE CHANGE,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agricultural Engineering.
B. B. Ross, D. N. Contractor, and V. O. Shanholtz.
Journal of Hydrology, Vol. 41, p 11-30, 1979. 7 fig, 4 tab, 30 ref. OWRT A-062-VA (5).

Descriptors: *Land use, *Finite element analysis, Surface flow, Mathematical models, Watersheds, Flood hydrographs, Overland flow, Channel flow.

This report presents a method of determining the hydrologic impact of land-use change on a watershed. With precipitation excess as input, the finite-element technique, utilizing Galerkin's residual method, was used to route mathematically overland and channel flow. The nature of the model allowed land-use changes to be easily incorporated into the model. A hypothetical watershed and an imaginary storm were used to obtain initial flood hydrographs. Several arbitrary land-use changes were then made and their effect upon the response of the watershed system determined.

CONTROLLING SEDIMENT DAMAGE,
Prince George's County Government, MD.
T. H. Secor.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 174-178, 3 tab. Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2.

Descriptors: *Sediments control, *Erosion control, *Water pollution sources, *Water quality standards, Soil types, Suspended solids, Turbidity, Flow rates, Land use, Agriculture, Construction, Soil conservation, Soil management, Rainfall-runoff relationships, Ecology, Soil properties, Soil stabilization, Potomac River basin.

Nonpoint source pollution varies in quantity and quality, is associated with runoff generated by storm events, and comes from diffuse sources. Setting standards for controlling sediment from nonpoint sources is difficult, because the problems involved in setting such standards are complex. The background levels of pollutants in streams and rivers vary from one region to another and from one river to another. Soils in different areas and climates are geologically different, and contribute to different water quality. Total suspended solids (TSS) and turbidity vary with flow rates, land use practices, rainfall intensity, and the effects of TSS and turbidity on aquatics. In accounting for these variabilities, standards must protect the biosphere from harmful concentrations, and should be tailored for each stream segment. Agriculture has traditionally been involved in erosion control, but is still the greatest contributor of sediment in the Potomac basin because it occupies a great portion of the basin. Control measures used by the construction sector in the Maryland-Virginia-Washington, D. C. area include diversion dikes, gravel outlet structures, straw bale barriers, sediment traps, temporary seedlings, and sediment basins, the latter being the most effective. Local ordinances controlling erosion from construction sites have been in effect in the Washington area for many years; other states have adopted manditory erosion and sediment control programs which have proven to be effective. 5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

EVALUATING POLLUTION STRESS ON ECOSYSTEMS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
K. L. Dickson, J. Cairns, Jr., J. R. Clark, and J. H. Rodgers.
In: The Freshwater Potomac: Aquatic Communities and Environmental Stress, p 80-83, 1978. 1 fig, 3 tab, 5 ref. Flynn, K. C., and Mason, W. T., Eds.. Interstate Commission on the Potomac River Basin. E-(40-1) 4939.

Descriptors: *Eutrophication, *Water pollution, *Environmental effects, *Ecosystems, Primary productivity, Photosynthesis, Aquatic microorganisms, Periphyton, Biomass, Measurement, Sulfates, Carbon, Aquatic life, Algae, Assay, Laboratory tests, Pollutant identification.

Some approaches to assessing pollutant impacts on ecosystem functions are discussed. Research activities conducted by the Aquatic Ecology Group at Virginia Polytechnic Institute have been confined to the development of methods to measure in situ C14 and S35 uptake by Periphyton (Aufwuchs) and an evaluation and adaptation of methods to measure living biomass of the Periphyton community. Measurements of the primary production of this community were made on natural and artificial substrates. An assay of S35 gave an estimate of the autotrophic versus the heterotrophic biomass of this complex community. The assimilatory sulfate reduction was shown to be linked in the algal components of the Periphyton, and can be distinguished from heterotrophic sulfate uptake by bacteria and fungi. Functional indicies, analogous to species diversity indices, were developed as a result of the evaluation of the Periphyton community. Trophic Index values, Functional Trophic values, and the computation of a Viability Index are discussed. It is concluded that a combination of information from functional indicies and information on the fauna and flora of a system will provide a better understanding of the biological integrity of the system. VOLTAMMETRIC ION SELECTIVE ELECTRODE FOR THE DETERMINATION OF NITRATE,
Southern Illinois Univ., Carbondale. Dept. of Chemistry and Biochemistry.
J. A. Cox, and G. R. Litwinski.
Analytical Chemistry, Vol. 51, p 554-556, April 1979. 3 fig, 16 ref. OWRT A-087-ILL(7).

Descriptors: *Nitrates, Chemical analysis, Anion exchange, Electrodes.

A sensor which uses an anion-exchange membrane to enclose a small volume electrolysis cell has been demonstrated to be suitable for nitrate determinations. The three-electrode cell includes a constrained mercury column indicator electrode; filter paper, which is impregnated with a 0.1 M KCl-0.01 M ZrOCl2 electrolyte, serves as the constraining barrier and as the spacer for the thin-layer electrolysis chamber. The anion-exchange membrane sheath permits transfer of nitrate from the sample into the electrolysis chamber by Donnan dialysis and excludes several species which would otherwise interfere. Controlled potential electrolysis at -1.25 V vs. Ag/AgCl provides the sensing current, the value of which is proportional to the sample concentration of nitrate. As a steady-state current is not developed with the present design, a defined current sampling time is used. Linear response over 3 orders-of-magnitude nitrate concentration is obtained. The detection limit using the current at 8 min. is 6.7 x 10-6M NO3-.

TESTING THE ENVIRONMENT FOR DISPERSED MUTAGENS: USE OF PLANT BIOCONCENTRATORS COUPLED WITH MICROBIAL MUTAGEN ASSAYS,
Massachusetts Univ., Amherst. Dept. of Botany.
W. S. Barnes, and E. J. Klekowski, Jr.
Environmental Health Perspectives, Vol. 27, p 61-67, December, 1978. 1 fig, 71 ref. OWRT B-053-MASS (4), 14-34-0001-6087.

Descriptors: Genetics, *Bioassay, *Ferns, Water pollution effects, Microbiology, Toxins, Plant pathology, Environmental effects, Carcinogens, Mutagens.

Mutagens dispersed in ecosystems are usually in low concentration and episodic in occurrence. The possibility of detecting such dispersed mutagens by utilizing indigenous bioconcentrator organisms coupled with a microbial mutagen assay may offer a useful screening protocol. Body extracts of these bioconcentrators can be suitably fractioned and tested for mutagens with various microbial mutagen assays. The fractions may be tested with a broad range of microbial assays covering numerous genetic end points as well as both with and without mammalian microsomal activation. This kind of environmental screening has an advantage over physicochemical techniques, in that sampling techniques are simpler and a wider chemical spectrum can be screened. There are problems inherent with testing a complex biological extract, however. If a reversion assay is used, the metabolite necessary for growth may be present. Toxins may be introduced, either concentrated from the environment in the same way as the mutagen, or produced by the concentrator itself. Finally, the concentrator may also produce an endogenous mutagen which will give spuriously active extracts. Methods for minimizing some of these difficulties are discussed. (Godfrey-Mass)
W79-07587

SCREENING AQUATIC ECOSYSTEMS FOR MUTAGENS WITH FERN BIOASSAYS,
Massachusetts Univ., Amherst. Dept. of Botany.
E. J. Klekowski, Jr.
Environmental Health Perspectives, Vol. 27, p 99-102, December, 1978. 11 ref. OWRT B-053-MASS (5), 14-34-0001-6087.

Descriptors: Genetics, *Bioassay, *Ferns, Water pollution effects, Toxins, Plant pathology, Environmental effects, Carcinogens, Mutagens, Osmunda regalis.

Recent research studies on the royal fern, Osmunda regalis, have documented a high incidence of post-zygotic mutational damage in a population growing in a river heavily polluted with paper processing wastes, whereas genetic studies of nearby populations in nonpolluted environments failed to detect mutational damage. Intensive genetic and cytogenetic studies of mutation in O. regalis indicate that natural populations of homosporous ferns may be useful in situ bioassay systems for monitoring the presence of mutagens in aquatic ecosystems. Since these organisms are long-lived perennials with an ontogenetic system which stores mutational damage, they can be manipulated to give an integrated estimate of mutational damage for specified blocks of time (in units of years). Thus, the fern bioassay may be an inexpensive means of detecting both chronic low dose and episodic high dose inputs of mutagenic pollutants into aquatic ecosystems. The fern mutagen bioassay is based upon the detection of numerous categories of post-zygotic mutation load in natural fern populations. The frequency of sporophytic and embryonic lethals, leaf or root mutations, auxotrophic gametophytic mutations as well as numerous phenotypic alterations of gametophyte morphology can be routinely detected and quantified. In addition, various two-break chromosome aberrations (paracentric inversions, reciprocal translocations and ring chromosomes) can be readily screened for in the spore mother cells of many homosporous ferns. (Godfrey-Mass)

CORRELATIONS BETWEEN DAPHNIA MAGNA AND FATHEAD MINNOW (PIMEPHALES PROMELAS) CHRONIC TOXICITY VALUES FOR SEVERAL CLASSES OF TEST SUBSTANCES,
Procter and Gamble Co., Cincinnati, OH. Ivorydale Technical Center.
A. W. Maki.
Journal of the Fisheries Research Board of Canada, Vol. 36, p 411-421, 1979. 6 fig, 7 tab, 31 ref.

Descriptors: *Bioassay, *Detergents, *Surfactants, *Daphnia, *Minnows, Methodology, Toxicity, Trophic level, Metals, Polychlorinated biphenyls, Pesticide toxicity, Fecundity, Chlorinated hydrocarbon pesticides, Linear alkylate sulfonates, Standards, Water chemistry.

Chronic toxicity values were developed for Daphnia magna with six surfactants and a detergent builder, each selected on the basis of previously existing chronic fish test data. Predictive correlations were examined for testing end points between 21-d Daphnia chronics and 1-yr fish chronics to provide a short-term alternative chronic test species while developing toxicity data for an intermediate trophic level species. For the detergent materials tested, a strong correlation ($r=0.98$) exists between Daphnia and fish no-effect concentrations. A replacement term, NOEC (no observed effect concentration), is suggested to clarify interpretive ambiguities associated with the definition of the MATC (maximum acceptable toxicant concentration) value. Additional chronic toxicity data from the current literature for these two test species and several test substances representing metals, polychlorinated biphenyl isomers, and pesticide formulations were similarly compared. The relatively short life cycle and 21-d duration of the test, small water volumes, ease in handling, high fecundity, and good correlation of 21-d chronic data with chronic fish toxicity data make Daphnia chronic tests an attractive alternative to the conduct of longer term fish tests. COMPARISON OF TOXINS IN THREE ISOLATES OF GONYAULAX TAMARENSIS (DINOPHYCEAE),
Rhode Island Univ., Kingston.
M. I. Alam, C. P. Hsu, and Y. Shimizu.
Journal of Phycology, Vol. 15, p 106-110, 1979. 3 fig, 1 tab, 19 ref.

Descriptors: *Toxicity, *Red Tide, *Dinoflagellates, *Gonyaulax, *Saxtoxin, Fish toxins, Poisons, Toxins, Chemical properties, Chemical analysis, Massachusetts, Cultures, Bioluminescence, Public

health, Falmouth, Orleans, Perch Pond, Mill Ponds.

Toxicity levels and profiles of three isolates of Gonyaulax tamarensis grown under the same conditions were compared. One isolate was collected from Ipswich, Massachusetts, during the massive red tide of 1972 along the New England coast. The other two isolates were obtained from Perch Pond (Falmouth, Massachusetts) and Mill Pond (Orleans, Massachusetts) located in the southwest and south of Cape Cod, Massachusetts, respectively. All the three cultures produced toxins with variation in their toxicity levels. Toxin contents were highest in the Ipswich isolate, followed in an order by Mill Pond and Perch Pond cultures. Morphological similarity existed between Ipswich and Mill Pond cells, whereas the Perch Pond cells possessed an additional ventral pore on the 1' epithecal plate. (Deal-EIS)

CHANGES IN PHYTOPLANKTON PHYSIOLOGY AND MORPHOLOGY IN RESPONSE TO DISSOLVED NUTRIENTS IN LOUGH NEAGH, N. IRELAND,
Northern Ireland Dept. of Agriculture, Antrim. Freshwater Biological Investigation Unit.
C. E. Gibson, and R. J. Stevens.
Freshwater Biology, Vol. 9, p 105-109, 1979. 2 fig, 10 ref.

Descriptors: *Nutrients, *Metabolism, *Phytoplankton, *Tissue analysis, *Ireland, Cyanophyta, Phosphorus, Carbohydrates, Absorption, Cytological studies, Biochemistry, Chemical analysis, Phosphates.

Cell phosphorus and anthrone-reactive carbohydrate contents were measured over a 6-month period in the phytoplankton of Lough Neagh, N. Ireland. When all the soluble reactive phosphorus had disappeared from the water column, cell phosphorus contents began to decrease, reaching a minimum value of 0.4% ash-free dry weight. At this time, cell carbohydrate contents greatly increased and phosphorus sorption assays showed rapid uptake of orthophosphate. Following a presumed sediment phosphorus release, cell carbohydrate and phosphorus uptake rate decreased greatly and there was a subsequent increase in cell phosphorus content to 1.6% ash-free dry weight. As the cell phosphorus content declined, blue-green algal filaments became progressively shorter. On the basis of these responses it is likely that phosphorus limitation occurred over a 4-week period. (Deal-EIS)

SOURCES OF HEAVY METAL CONTAMINATION IN A RIVER-LAKE SYSTEM,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
T. A. Jackson.
Environmental Pollution, Vol. 18, p 131-138, 1979. 3 fig, 1 tab, 13 ref.

Descriptors: *Heavy metals, *Lakes, *Bottom sediments, *Wabigoon River(Canada), Mercury, Copper, Zinc, Cadmium, Iron, Path of pollutants, Sediment transport, Industrial wastes, Chemical wastes, Water chemistry, Chemical analysis.

Sediments of the Wabigoon River, Ontario, are polluted with Hg from an industrial source at Dryden. Downstream the river flows first through Clay Lake and then through Ball Lake. Hg, Cu, Zn, Cd and Fe concentrations in sediments of both lakes are correlated with organic C, but Hg content per unit concentration of organic C is higher, and increases more steeply with organic C, in Clay Lake than in Ball lake; in contrast, the Cu, Zn, Cd, and Fe concentrations per unit concentration of organic C are nearly the same in both lakes. These results substantiate the conclusion that the Hg originated at a point upstream from the lakes and tended to accumulate in Clay Lake on its way downstream, whereas the other metals were leached into the two lakes from diffuse sources in the surrounding terrain. Accumulation of river-borne organice pollutants in Clay Lake was also demonstrated. Application of the methods employed to the general problem of recognising and locating element anomalies is discussed. (Deal-EIS)

A PORTABLE SUCTION DREDGE FOR QUANTITATIVE SAMPLING IN DIFFICULT SUBSTRATES,
Rosenstiel School of Marine and Atmospheric Science, Miami, FL.
I. M. Brook.
Estuaries, Vol. 2, No. 1, p 53-56, 1979. 3 fig, 15 ref.

Descriptors: *Sampling, *Research equipment, *Bottom sampling, Sediments, On-site data collections, Dredging, Bottom sediments, Grasses, Benthic flora, Benthic fauna.

A lightweight, portable suction dredge has been used for five bottom types which usually present problems to benthic investigators. Water depth ranged from 0.25m to 5m. By use of a 0.25m2 quadrant or using the suction end as a probe with the depth of penetration limited by a collar, quantitative samples were taken in coarse sand, fine flocculent mud, dense turtle grass (Thalassia testudinum), sparse turtle grass over coralline rubble (Porites sp.) and carbonate rock with an overlay of shell rubble. The samples consisted of the material retained by a collecting bag attached to the suction dredge. None of the commonly used benthic sampling devices could obtain samples at all stations. (Deal-EIS)

FACTORS INFLUENCING PH IN LAKE WATER,
Swedish Water and Air Pollution Research Lab., Goteborg (Sweden).
C. Brosset.
Water, Air and Soil Pollution, Vol. 11, No. 1, p 57-62, 1979. 2 fig, 3 tab, 1 ref.

Descriptors: *Acidic water, *Lakes, *Humic acids, *Hydrogen ion concentration, Humus, Acids, Organic matter, Chemical analysis, Water chemistry, Organic acids, Acid-base equilibrium, Analytical techniques.

Using an improved titration technique, Lee and Brosset have established the presence in a number of lake waters of an acid with (k sub a)=0.0003. It is shown that higher concentrations of this acid, which seems to correspond to a functional group of humus, may under certain conditions drastically contribute to the lowering of pH of lake water. In lake water containing no humic acid or humic acid in the concentration 0.0001 equiv/l to the minus first power, pH reduction has been calculated as a function of strong acid deposition. It was found that the ability of lake water to withstand a decrease in pH can be drastically reduced by the presence of higher concentrations of humic acid. (Deal-EIS)

DISTRIBUTION AND FRACTIONATION OF ARSENIC IN SELECTED FRESH WATER LAKE SEDIMENTS,
Saskatchewan Univ., Saskatoon. Dept. of Soil Science.
P. M. Huang, and W. K. Liaw.
Internationale Revue den Gesamten Hydrobiologie, Vol. 63, No. 4, p 533-543, 1978. 2 fig, 5 tab, 23 ref.

Descriptors: *Sediments, *Lakes, *Lake sediments, *Arsenic, *Apatite, Colloids, Carbonates, Organic matter, Silicates, Particle size, Agricultural runoff, Erosion, Food chains, Water chemistry.

The distribution and nature of the As-bearing components of the sediments of selected fresh water lakes in Saskatchewan, Canada, were studied. The total As contents ranged from 2.7 to 13.2 ppm As and were found to be present in both colloidal and non-colloidal fractions of the lake sediments. The proportion of the As bound to carbonates, organic matter and sesquioxides accounted for 12 to 74% of the total As of the sediments. The remaining As was apparently associated with apatite and silicates. The data indicate that the bulk of As in the lake sediments resides in sequioxidic components and apatite. The release of As from the lake sediments would thus be affected by the stability of these As-bearing components in a series of particle size fractions. Furthermore, based on information on the geographical distribution of As in the lake sediments, land erosion and agricultural runoff appear to be contributing significantly to the As concentration in lake sediments. It is thus suggested that close attention should be paid to land management and soil conservation to prevent further enrichment of As in lake sediments and to curtail the subsequent As contamination of the food chain. NUTRIENT BUDGET ANALYSIS FOR REND LAKE IN ILLINOIS,
Illinois State Water Survey, Peoria. Water Quality, Section.
V. Kothandaraman, and R. L. Evans.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 105, No. EE3, Proceedings Paper 14616, p 547-556, June 1979. 3 fig, 4 tab, 11 ref, 1 append.

Descriptors: *Nutrients, *Lakes, *Streams, *Illinois, Algae, Streamflow, Water pollution, Water pollution sources, Sediments, Turbidity, Suspended solids, Phosphorus, Nitrates, Sodium, Potassium, Sampling, On-site investigations, Data processing, *Rend Lake(IL).

A new method for computing long-term average nutrient loads transported to the Rend Lake in southern Illinois by its tributaries was presented. The procedure was adopted from the Geological Survey's flow-duration curve method developed for determining the long-term average sediment loads transported by streams. The nitrogen and phosphorus loads exerted on Rend Lake were found to be excessive. The lake is of recent origin, and, despite the excessive nutrients input, algal counts in the lake are not of bloom proportion. Controlling phosphorus at the point sources will be a major step in arresting the accelerated aging of the lake. (Sims-ISWS)

AN INDEX OF REFRACTORY ORGANICS,
Connecticut Univ., Storrs. Dept. of Civil Engineering.
T. B. Helfgott, F. L. Hart, and R. G. Bedard.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 438, Price codes: A07 in paper copy, A01 in microfiche. Report EPA-600/2-77-174, 1977. 131 p, 2 fig, 13 tab, 49 ref, 4 append.

Descriptors: *Refractivity, *Organic compounds, *Persistence, *Evaluation, *Industrial wastes, Biodegradation, Inhibitors, Waste water treatment, Biochemical oxygen demand, Activated sludge.

Laboratory techniques for, and interpretations of, a Refractory Index were developed to quantitatively assess the persistency of refractory organics. The Refractory Index is then used to evaluate 38 industrial, natural and combined organics. Index values close to 1.0 characterize readily biodegradation; index values close to 0 indicate refractory organics; negative index values indicate inhibitors. The index value coefficient of variation is 13%. A Biological Inhibition Value was developed and used to quantitatively assess those organics found to interfere with biochemical tests used. In some cases, confirmation of the Refractory Index interpretation was performed using a model activated sludge unit and by specific analysis. Correlations between oxygen demand tests and organic parameters (total organic carbon) are presented. Suggestions for required pretreatments of industrial waste waters before allowing discharge into municipal sewage treatment plants are included as an application of the Refractory Index criterion. Descriptors: *Texas, *Spectrophotometry, *Metals, *Pollutant identification, Water pollution effects, Environmental effects, Heavy metals, Baseline studies, Cadmium, Nickel, Lead, *Outer Continental Shelf, Petroleum hydrocarbons, South Texas Outer Continental Shelf(STOCS).

A procedure is described using ammonium pyrrolidine dithiocarbamate (APDC) for the co-precipitation and preconcentration of trace metals in orga-

nism digests for subsequent determination using flameless atomic absorption spectrophotometry (AAS). The MLR coprex procedure described provides greatly increased sensitivity at the expense of increased variability. Therefore, it is a highly sensitive but semi-quantitative procedure for the study of certain trace metals in biological tissues. The method best measures Pb in all sample types, Ni in gill and Cd in liver tissues; and it is least effective in estimating Ni levels in muscle and liver. Application of the procedure to STOCS samples with previously undetectable metal levels generally confirms the low levels of Cd and Ni reported and indicates that Pb levels in these samples are only slightly below the detection limit. AUTOMATED DETERMINATION OF TIN IN WATER,
Geological Survey, Denver, CO. Water Resources Div.
G. Pyen, and M. Fishman.
Atomic Absorption Newsletter, Vol. 18, No. 1, p 34-36, January-February 1979. 1 fig, 4 tab, 3 ref.

Descriptors: *Water analysis, *Bottom sediments, *Trace elements, *Chemical analysis, *Analytical techniques, Laboratory tests, *Atomic absorption spectrometer, *Tin, Sample preparation.

An automated laboratory flow-through procedure was developed to determine tin in water and streambed materials. Sample solutions for streambed materials are obtained by a standard U.S. Geological Survey extraction procedure. The interferences from most trace elements are eliminated by addition of EDTA. Sodium borohydride is added to the sample stream to form tin hydride which is then stripped from the solution with the aid of nitrogen and decomposed at 850C in a tube furnace that is in the optical path of an atomic absorption spectrometer. Twenty samples per hour can be analyzed. The detection limits are 1 microgram/L and 0.1 microgram/g for water samples and streambed materials, respectively. (Woodard-USGS)

ARSENIC CONTAMINATION OF GROUND WATER IN THE MARITIMES,
Department of the Environment, Ottawa (Ontario). Hydrology Research Div.
D. J. Bottomley.
In: Hydrology Research Division, Annual Progress Reports and Short Notes, 1977-78. p 83-89, 1979. 3 tab, 2 ref. Environment Canada Inland Waters Directorate, Ottawa, Report Series No. 64. HR 77-2.

Descriptors: *Arsenic compounds, *Water pollution, *Groundwater, *Sampling, *Laboratory tests, Analytical techniques, Spectroscopy, Well data, Well casings, Iron, Manganese, Alkalinity, Sulfates, Silica, Chlorides, Fluorides, Carbon, Organic compounds, Lead, Copper, Zinc, Nickel, Cadmium, Potassium, Strontium, Sodium, Nova Scotia(Canada), New Brunswick(Canada).

Three wells in Nova Scotia were sampled at the well head for major ion and trace element analysis; cation analysis; sulfate, chloride, silica, alkalinity and fluoride determinations; and organic carbon analysis. Atomic absorption spectroscopy was used to analyze As, Fe, Mn, Cu, Pb, Zn, Co, Ni, Cd, Ca, Mg, K, and Sr; sodium was analyzed by flame emmission. Manual arsine generation with sodium borohydride was used to analyze arsenic. It was found that the sampling methodology and pumping generation affected the concentrations of arsenic iron, and manganese in each well, and that in large diameter deep wells, a peristaltic pump was unsatisfactory for providing representative samples of arsenic, iron and manganese levels due to its inability to flush adequately the casing contaminants from the well. Concentrations of Cu, Pb, Zn, Co, and Ni were less than 5 micrograms/L, and Cd concentration was less than 1 microgram/L. Data obtained from Harvey, Waverley and Miller Lake samples indicate that most arsenic at Waverley is in the As3t state, and most of the inorganic arsenic at Harvey and Miller Lake is as As5t in the form of H2As04- or HAs042-. MICROBIOLOGICAL STUDIES,
Maryland Univ., College Park. Dept. of Microbiology.
R. R. Colwell, and M. R. Belas.
Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2. In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 9-14, 5 fig, 1 tab, 5 ref.

Descriptors: *Microorganisms, *Aquatic bacteria, *Coliforms, *Water pollution sources, *Potomac River, Analytical techniques, Data collections, Sampling, Monitoring, Water quality, Interstate Commission on the Potomac River Basin.

Data on the microbiology of the Potomac River were gathered from the Interstate Commission on the Potomac River Basin (ICPRB) for the years 1960 through 1975, and from the U. S. Army Corps of Engineers for the years 1950 through 1975 for statistical analysis to determine whether a decline in water quality has occurred as measured by microbiological indices. These data were entered and stored in the University of Maryland UNIVAC 1108 computer where multivariate analysis of variance (MANOVA), regression, and correlation coefficient tests were conducted at the five percent level of significance on the total data set and on selected subsets of the larger data file. Significant differences were observed in the downstream total coliform counts which most likely come from point source pollution entering the River during its down stream flow. Large increases in bacterial numbers were observed at Williamsport, Maryland, as the flow moved downstream. No detectable year to year change in water quality downstream was observed. Differences in yearly grand means of the total coliform counts could be distinguished with a significant increase in bacterial numbers for 1968. Because ICPRB data were limited no conclusions could be made regarding improvement or decline in water quality based on microbiological parameters. From the U. S. Army Corps of Engineers data, a general trend was noted toward increasing number of coliform bacteria at Great Falls during the 1950 to 1977 period. It is concluded that water quality is decreasing in the Potomac and that measuring and sampling techniques are inadequate for detecting water quality changes. (Davison-IPA)

PHYTOPLANKTON,
Environmental Monitoring and Support Lab., Cincinnati, OH.
C. I. Weber, W. T. Mason, and V. J. Rasin.
Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2. In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 15-24, 10 fig, 3 tab, 19 ref.

Descriptors: *Phytoplankton, *Data collections, *Data storage and retrieval, *Potomac River, Eutrophication, Nutrients, Sampling, Analytical techniques, Zooplankton, Water pollution sources, Water pollution, Water quality.

Systematic sampling of the phytoplankton was carried out at four stations in the Potomac River Basin by the National Water Quality Network from 1958 through 1967. Samples collected on about the first and 15th of each month had volume of 3.6 liters, and were preserved with 36 mg/liter MERTHIOLATE (Copyright). Three types of analyses were performed on each sample at the central laboratory in Cincinnati: (1) Sedgwick-Rafter phytoplankton count, (2) a diatom species count, and (3) a zooplankton count. The basic data on the species and abundance of the plankton are currently stored in the files of the Aquatic Biology section, Environmental Monitoring and Support Laboratory, EPA, Cincinnati, Ohio, and the summary data were coded, machined and entered on line into the Storet system. The total annual mean phytoplankton counts increased with distance downstream from Williamsport, the uppermost station on the river. This indicated favorable growth conditions, such as higher concentrations of dissolved nutrients. The percentage of the total counts exceeding 10,000 units/ml was 2% at Williamsport, 18% at Great Falls, and 37% at Washington. The lower Potomac would be considered highly eutrophic on the basis of total counts. The diversity of the phytoplankton measured as numbers of genera, increased with distance downstream from Williamsport. The dominant genera, increased with distance downstream from Williamsport. The dominant genera indicated significant levels of nutrient enrichment. The plankton genera in the Potomac River are tabulated. It is concluded that the total counts and taxonomic composition of the River are characteristic of surface waters with high concentrations nutrients occurring in waste treatment plant effluents. ROOTED AQUATIC PLANTS,
Environmental Protection Agency, Washington, DC. Office of Water and Hazardous Materials.
L. Keup, and D. B. Hicks.
Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2. In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 25-28, 1 fig, 3 tab, 4 ref.

Descriptors: *Rooted aquatic plants, *Nutrients, *Nitrogen, *Phosphorus, Eutrophication, Sampling, Standing crop, Potomac River, Monocacy River, Antietam Creek, Conococheague River, South Branch Potomac River, Cacapon River, Shenandoah River.

A study was conducted of the aquatic plants in the upper Potomac River Basin by the EPA Division of Field Investigations to estimate the quantity of phosphorus (P) and organic nitrogen (N) accumulated in rooted plant growth, and to assess the significance of those stored nutrients on the nutrient budget of the River Basin. The study area extended 220 miles upstream from Great Falls to

the confluence of the Savage River, and included the following tributaries: Monocacy River, Antietam Creek, Conococheague Creek, South Branch Potomac River, Cacapon River, and Shenandoah River. Study results are reported as estimated tons of plants containing P and N in terms of pounds for the upper Potomac River, Antietam Creek, and Conococheague Creek. The Monocacy, South Branch Potomac, Shenandoah, and Cacapon Rivers did not contain sufficient growths of aquatic plants from which standing crop estimates could be made. It is concluded that the rooted aquatic plants in the upper Potomac basin are not a significant factor in the nutrient budget of the lower Potomac River, because the quantities of P and N contained are equivalent to about 40% of the P and N in the waste waters discharged to the upper Potomac River in a single day. (Davison-IPA)

BIOLOGICAL INDICES IN WATER QUALITY ASSESSMENT,
Versar, Inc., Springfield, VA.
J. R. Freed, and M. W. Slimat.
Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2. In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 76-79, 16 ref.

Descriptors: *Bioindicators, *Water pollution effects, *Water quality, *Chemical analysis, Water analsis, Ecology, Ecosystems, Evaluation, Indicators, Pollutant identification, Federal Water Pollution Control Act Amendments of 1972, Mattawoman Creek(Maryland).

The settlement of litigation between environmental groups and the EPA over whether the assessment of water quality should include biological indices as well as chemical indices required the EPA to develop knowledge on biological means to measure water quality. Advantages of biological assessment methods include: (1) they complement the more frequently used chemical methods; (2) they measure the response of the biotic community; (3) they measure the results of pollution, and therefore are more indicative of the consequences of pollution; and (4) because the biotic community represents 'the results of a summation of the prevailing conditions,' the effects of intermittent or single discharges of pollution can be measured. Various biological indices for assessing water quality are examined. When a study must be confined to a synoptic component of the condition of the whole ecosystem, it is felt that benthic invertebrates are most likely to be the most useful group to be studied. The saprobien system recognizes three major zones indicative of organic pollution. The indicator organism approach, a derivative of the saprobiensystem, uses organisms classified according to their ability to tolerate organic pollution. Reference station methods compare the characteristcs of clean water habitats with polluted habitats. Diversity indices, some of the most widely used tools, characterize communities by the number of species present. An example of the use of biological indices to assess long-term water quality after an oil spill in a tributary of the Potomac River is given. (Davison-IPA)

EFFLUENT TOXICITY TESTING,
Environmental Protection Agency, Wheeling, WV.
H. R. Preston.
Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2. In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 84-89, 2 fig, 1 tab, 4 ref.

Descriptors: *Pollutant identification, *Effluents, *Toxicity, *Water pollution, *Industrial wastes, *Municipal wastes, Analytical techniques, Water analysis, Water quality, Technology, Equipment, Minnows, Liquid wastes, Construction materials, Laboratory tests.

The basic needs and requirements for conducting valid toxicity tests on municipal and industrial effluents are discussed. A mobile laboratory developed by the aquatic biologists of EPA Region III is capable of performing static and continuous flow toxicity tests near effluent discharge points. The mobile laboratory is designed to meet the specifications required by accepted methodology as identified in 'Methods for Acute Toxicity Tests with Fish, Macroinvertebrates and Amphibians,' EPA-660/3-75-009, April 1975. Effluent, pumped to the laboratory, is proportionally mixed with the receiving water and delivered to test containers. Toxicity tests are conducted on different effluent concentrations for a standard 96-hour period; each exposure and controls are tested in duplicate. The fathead minnow is used as the test organism, because it is indigenous to most of the U.S., is easy to maintain and reproduce in the laboratory, and is commercially available. Testing requirements, construction materials, and equipment are discussed. The testing procedure is described. The results of toxicity tests conducted on 11 different discharges from five industrial types show all but two produced some level of measurable acute toxicity. Schematic diagrams illustrate the laboratory floor plan and the laboratory interior. (Davison-IPA)

BIOMONITORING OF PULP AND PAPER EFFLUENTS,
Institute of Paper Chemistry, Appleton, WI.
E. F. Zanella, G. Katz, and G. Shoemaker.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 137-142, 2 fig, 2 tab.

Descriptors: *Pollution abatement, *Water quality, *Bioindicators, *Aquatic invertebrates, *Municipal wastes, *Industrial wastes, *Pulp wastes, Water quality control, North Branch Potomac River(Maryland), Luke(Maryland), Westvaco Corporation, Biochemical oxygen demand, Suspended solids.

The biological water quality investigation of effluent from the Westvaco Corporation mill in Luke, Maryland, relies on the distribution and community structure parameters of resident macroinvertebrates of the North Branch Potomac River to indicate changes in water quality. Data were collected from 12 mainstream stations and three tributary stations over 18 years from 1959 to 1976. A regional waste treatment facility constructed by the Upper Potomac River Commission (UPRC) 1960 treats mill effluents and municipal wastes from three towns. Until recently the mill discharges included wastes treated by the UPRC facility and unsegregated process streams and discharges which went directly from the mill to the river. The main waste stream components of BOD5 and total suspended solids (TSS) for direct mill discharges, UPRC treatment plant discharges, and total discharges to the river are tabulated for the years of the monitoring program. Major reductions have occurred in the most recent five-year period, coinciding with the steady improvement in the macroinvertebrate community in the North Branch Potomac River. Immediately upstream from the mill site North Branch water quality is still in extremely poor condition. Water quality rapidly improves from the mill to mile 45, and for the last 20 miles of this study the biological communities indicate good to excellent water quality. Faunal distribution has increased 44% in the critical zone between mile -1.8 to mile 29 since the 1959 base line survey. (Davison-IPA)

WATER QUALITY EFFORTS BY CHEMICAL INDUSTRIES,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies.
A. C. Hendricks.
Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2. In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 143-146, 1 fig, 4 tab, 8 ref.

Descriptors: *Pollution abatement, *Industrial wastes, *Chemical wastes, *Water quality control, Water pollution treatment, Pollutant identification, Water pollution sources, Potomac River basin, Avtex Fiber Plant(Front Royal VA).

The major chemical industries in the Potomac River basin have installed extensive treatment facilities to improve quality of their effluents. One plant, the Avtex Fiber Plant at Front Royal, Virginia, installed waste treatment facilities with primary and secondary treatments at the plant in 1974. The previous owner of the plant, FMC, initiated a bottom fauna and fish bioassay program in 1972 which is being continued by Avtex. The data from those programs indicates a reduction in effluent toxicity, particularly after the installation of the secondary treatment facility. Chemical parameters Avtex is required to monitor by the state of Virginia include: BOD5, zinc and total suspended solids. Over the past 10 years the water quality in the Potomac River basin has improved. It is concluded that the improvement appears to be due to the water quality enhancement efforts of the industries and municipalities of the basin. (Davison-IPA)

THE DISTRIBUTION OF TRACE METALS IN THE WILDERNESS LAKES,
National Physical Research Lab., Pretoria (South Africa). Applied Spectroscopy Div.
R. J. Watling.
Water S. A., Vol. 5, No. 1, p 1-13, January 1979. 9 fig, 5 tab, 17 ref.

Descriptors: *Water analysis, *Sediments, *Cores, *Sampling, *Metals, *Copper, Lead, Zinc, Iron, Manganese, Cobalt, Cadmium, Nickel, Mercury, Sodium, Potassium, Calcium, Strontium, Aluminum, Chromium, Water pollution sources, Trace metals, Wilderness Lakes(South Africa).

Surface water, sediment, and sediment core samples were taken in the Wilderness Lakes area on the coast between Cape Town and Port Elizabeth, South Africa, to provide information on the trace metals present in the lakes, and to establish trends in metal build-up. Concentrations of the following nine trace metals found in the surface waters are tabulated: Cu, Pb, Zn, Fe, Mn, Co, Ni, Cd, and Hg. Generally little overall variation for Cu, Pb, Zn, Ni, Co, and Cd was found. The relatively high levels of lead found near the northern and eastern ends of Swartulei Lake near the town of Sedgefield are a possible result of urban pollution. Results for metal concentrations in the Wilderness Lakes sediments are tabulated for: Cu, Pb, Zn, Fe, Mn, Co, Ni, Cd, Na, K, Ca, Mg, Sr, Al, and Cr. Copper level in the sediments was low, but occasional isolated anomalies occur, such as that at the eastern end of Langvlei Lake which was attributed to pollution from adjacent road work. Lead and zinc distribution was elevated but uniform, and also associated with the road work in the upper reaches of the lagoon. Core sediment samples were analyzed statistically to obtain interelemental relationships. In addition to confirming the results obtained for the surface sediment samples, evidence of pollution from motor fuel was noted in the marked increase of lead in the top centimeters of some cores. Only cores from Sedgefield, Island Lake Yacht Club, and Island Lake Holiday Camp showed evidence of pollution by man. Correlation frequency diagrams indicate the area is relatively free of pollution with respect to metals. (Davison-IPA)

5B. Sources Of Pollution

REPORT ON TOXIC/HAZARDOUS ORGANIC COMPOUNDS IN THE WABASH RIVER BASIN,
Environmental Protection Agency, Chicago, IL. Central District Office.
D. H. Stoltenberg.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 548, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA-905/3-77-001, July 1977. 112 p, 3 fig, 16 tab, 16 ref, 5 append.

Descriptors: *Waste pollution sources, *Hazards, *Poisons, *Toxicity, *Organic loading, *Organic wastes, Municipal wastes, Industrial wastes, Sludge, Sediments, Rivers, Streams, Water supply, Wabash River Basin.

All available ambient and point source organics data on the Wabash River Basin are gathered from previous studies, condensed, and presented. Information from the EPA, Indiana State Board of Health, and Illinois EPA includes industrial and municipal point source data, ambient river and stream data, fish data, carbon filter data, sludge and sediment data, and public water supply data. Major and minor municipal, industrial, and Federal known or potential dischargers of toxic/hazardous organics are listed. For each compound from each source data are presented in terms of micrograms/l and lb/da. All 304 sources were analyzed for about 78 compounds. These compounds are ranked in decreasing order of magnitude from the sources tested. Eleven conclusions/recommendations resulting from this Phase I investigation are presented. Excerpts from previous reports are provided in the appendices. (Davison-IPA)

BUOYANT JET DISCHARGE INTO FINITE AMBIENT WATERS,
Indian Inst. of Tech., Madras. Ocean Engineering Centre.
I. V. Muralikrishna, and K. V. N. Sarma.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Proceedings Paper 14586, p 517-532, May 1979. 20 fig, 2 tab, 6 ref, 2 append.

Descriptors: *Heated water, *Thermal pollution, *Dispersion, *Jets, Discharge(Water), Cooling water, Powerplants, Buoyancy, Density, Entrainment, Mixing, Heat, Temperature, Water temperature, Distribution patterns, Laboratory tests, Correlation analysis.

The paper presented the results of an experimental study regarding the effect of the lateral dimension of the receiving water on the spreading, mixing, and temperature decay of a horizontal buoyant surface jet. The widths of the ambient water in the experiments were 240, 120, 90, and 60 times the diameter of the jet nozzle. Based on the experimental data, correlations were carried out, and empirical equations for prediction of jet width, thickness in vertical direction, and longitudinal temperature decay were obtained. The available data of earlier investigators were included to obtain generalized equations for the spreading and temperature decay. Similarity of temperature profiles in the lateral and vertical directions was observed. The longitudinal temperature decay was found to vary inversely with distance in the flow direction and 1/4th power of the densimetric Froude number. (Sims-ISWS)

IDENTIFICATION OF SUSPENDED SEDIMENT SOURCES BY MEANS OF MAGNETIC MEASUREMENTS: SOME PRELIMINARY RESULTS,
Liverpool Univ. (England). Dept. of Geography.
F. Oldfield, T. A. Rummery, R. Thompson, and D. E. Walling.
Water Resources Research, Vol. 15, No. 2, p 211-218, April 1979. 7 fig, 2 tab, 22 ref.

Descriptors: *Suspended solids, *Sediments, *Magnetic studies, Water pollution sources, Soil erosion, Soils, Watersheds(Basins), Streams, Rivers, Rainfall, Runoff, On-site investigations, Erosion, Sedimentation, *Exeter(United Kingdom).

Rapid, nondestructive magnetic measurements of initial low-field susceptibility (Chi), saturation isothermal remanent magnetization (IRM sub sat), and coercivity of IRM provide a means of identifying the source of suspended sediments in rivers. Preliminary results derived from the application of these measurements both to suspended sediment and to potential sources within the instrumented catchment of the Jackmoor Brook near Exeter, United Kingdom, demonstrated the value of this approach in an area of Permian sandstone bedrock where the contrast in magnetic properties between parent material and topsoil is easily characterized. High flows were shown to be associated with suspended sediment, the magnetic properties of which are indistinguishable from those of the cultivated soils of the catchment. (Sims-ISWS)

ARSENIC IN STREAMS, STREAM SEDIMENTS, AND GROUND WATER, FAIRBANKS AREA, ALASKA,
Alaska Univ., Fairbanks. Inst. of Water Resources.
F. H. Wilson, and D. B. Hawkins.
Environmental Geology, Vol. 2, No. 4, p 195-202, July-August, 1978. 4 fig, 13 ref. OWRT A-050-ALAS (1).

Descriptors: *Arsenic compounds, *Alaska, *Water pollution, Mine wastes, Spoil banks, Dredging, Streams, Suspended load, Sediment, Bed load, Water wells, Well casings, Surface water, Groundwater, Mining, Mills, Weathering, Geochemistry.

The arsenic content of streams and ground water in the Pedro Dome-Cleary Summit area, 30 kilometers north of Fairbanks, Alaska, was evaluated. Arsenic is associated with gold mineralization in this area and is believed to reach the surface and ground waters through weathering of arsenic-containing rocks in mine tailings. Wells drilled through dredge tailings without casings cemented in place were found to have high arsenic concentrations. The mobility of arsenic in surface and ground waters is closely tied to the behavior of iron in these waters. Because of the mobility of arsenic and the numerous sources of arsenic available in the Fairbanks area, public and private water supplies in the mineralized zone should be examined for arsenic contamination. In addition, treatment techniques suitable for home use to remove arsenic and other metal pollutants should be developed. (Purdin-NWWA)
W79-07563

A FIELD STUDY OF THE RELATIONSHIP BETWEEN HEAVY METAL CONCENTRATIONS IN STREAM WATER AND SELECTED BENTHIC MACROINVERTEBRATE SPECIES,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
R. P. Maas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 284, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, 1978. 74 p, 13 fig, 13 tab. OWRT A-095-NC (1), 14-34-0001-9035.

Descriptors: *Heavy metals, Benthic macroinvertebrates, Stream monitoring, *Bioindicators, Streams, Cadmium, Chromium, Zinc.

The correlation between heavy metal concentrations in stream water and selected benthic macroinvertebrate species from stations on the Neuse River, NC watershed was studied to determine the utility of benthic macroinvertebrates as monitors of short and long term stream metal conditions. Cadmium, chromium and zinc were determined in both water and test organisms by graphite furnace atomic adsorption spectrophotometry (GFAAS). The GFAAS method proved satisfactory for metal quantification in all water and test organism samples. Relatively good linear correlations between water and test organism metal concentrations were observed for most cases. The highest correlations were observed for chromium while zinc exhibited the poorest linear correlations due to the substantial levels of this metal found naturally even in organisms existing in relatively zinc free waters. Results of laboratory exposure and daily field sampling experiments showed that metal uptake to equilibrium levels generally occurred within one day of exposure, while loss of metal to equilibrium levels required two to six days following cessation of exposure. The evaluation of the response of the test organisms to their surrounding aqueous metal concentrations was limited by the relatively low and narrow metal concentration range observed at most of the sampling stations. (Kiger-North Carolina)

MICROBIOLOGICAL STUDIES ON THE NITROGEN CYCLE IN AQUATIC ENVIRONMENTS - V NITROGEN METABOLISM IN THE GOLDFISH CULTURING POND,
Kyoto Univ., (Japan). Research Inst. for Food Science.
A. Kawai, and M. Sugiyama.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 45, No. 1, p 61-65, 1979. 9 fig, 2 tab, 4 ref.

Descriptors: *Nitrogen cycle, *Metabolism, Aquiculture, Fish hatchery, *Goldfish, Nitrogen, Nitrates, Nitrites, Tracers, Radioactivity techniques, Trophic level, Ammonium compounds, Zooplankton, Microbial degradation, Denitrification, Water chemistry, Phytoplankton, Bottom sediments, Aquatic bacteria.

By the use of the 15N tracer technique, nitrogen metabolism was studied in the model system of a goldfish culturing pond. A large part of the 15N labeled ammonium nitrogen metabolized was incorporated into the organisms of the primary trophic level in the early stages of the experiment, then transformed into dissolved organic nitrogen either in the excretion of the organisms or in the decomposition process of their dead bodies. On the other side, only a small amount of this ammonium nitrogen was incorporated into the organisms of the higher trophic level, zooplankton and fish. Ammonium nitrogen in the water was oxidized to nitrate nitrogen via nitrites; a considerable part of this nitrite nitrogen was transformed to gaseous nitrogen in the process of bacterial denitrification. A large amount of ammonium nitrogen was also transfered into the bottom mud through various metabolic pathways. (See also W78-12867) (Deal-EIS)

EXPERIMENTAL DEGRADATION OF CRUDE OIL BY MARINE BACTERIA,
Kobe Univ. of Mercantile Marine (Japan). Research Inst. of Marine Cargo Transportation.
S. Nagata, G. Kondo, and T. Asano.
Journal of the Oceanographical Society of Japan, Vol. 34, p 105-107, 1978. 1 fig, 3 tab, 6 ref.

Descriptors: *Microbial degradation, *Marine bacteria, *Oil, *Achromobacter, *Staphylococcus, *Acinetobacter, *Corynebacterium, *Listeria, *Aeromonas, *Flavobacterium, *Chromobacterium, *Micrococcus, *Arthrobacter, Biodegradation, Aromatic compounds, Organic compounds, Bacteria, Industrial wastes, Oil pollution, Growth rates, Cultures.

The ability to biodegrade crude oil was examined for ten strains of marine bacteria. With regard to their degradation ability for n-alkanes the microorganisms tested could be divided into four groups. The four groups, in increasing order of biodegradation ability, were: (A) Achromobacter sp., Staphylococcus sp.; (B) Acinetobacter sp., Corynebacterium sp., Listeria sp.; (C) Aeromonas sp., Flavobacterium sp., Chromobacterium sp.; and, (D) Micrococcus sp. and Arthrobacter sp. The same result was not observed for microbial degradation of aromatic hydrocarbons obtained by the UV measurements. (Deal-EIS)

UPTAKE OF METHYLAMINE (AN AMMONIUM ANALOGUE) BY MACROCYSTIS PYRIFERA (PHAEOPHYTA),
California Inst., of Tech., Corona Del Mar. Kerckhoff Marine Lab.
P. A. Wheeler.
Journal of Phycology, Vol. 15, p 12-17, 1979. 3 fig, 5 tab, 18 ref.

Descriptors: *Absorption, *Ammonium compounds, *Phaeophyta, *Tissue analysis, *Methylamine, Nitrogen compounds, Plant physiology, Plant tissues, Radioactivity techniques, Tracers, Carbon radioisotopes, Inhibition, Chemical analysis, Marine algae, Water temperature, Hydrogen ion concentration, Enzymes, Nutrients.

The ammonium analogue, methylamine, is taken up rapidly from dilute solution by Macrocystis pyrifera. 14C-methylamine was used to characterize the transport system, with respect to dependence on external concentration, temperature, pH and substrate specificity. The results suggest that methylamine enters the algal tissue via a specific mediated transport system. Uptake of methylamine showed no consistent relation to the N content of the plant tissue, but was highly dependent on the portion of plant sampled and severely affected by cutting the tissue. The strong inhibition of methylamine uptake by ammonium and lesser inhibition by other alkylamines suggests that the uptake functions as an 'ammonium permease'. Uptake of 14C-methylamine can be used as a highly sensitive measure of NH4+ uptake activity and should be a useful tool for studying NH4+ uptake in the laboratory and field. (Deal-EIS)

EXPANSION OF A CENTRAL CALIFORNIA KELP FOREST FOLLOWING THE MASS MORTALITY OF SEA URCHINS,
California Univ., Santa Cruz. Center for Coastal Marine Studies.
K. S. Pearse, and A. H. Hines.
Marine Biology, Vol. 51, p 83-91, 1979. 6 fig, 1 tab, 27 ref.

Descriptors: *Mortality, *Phaeophyta, *Competition, *Kelps, *Sea urchins, *Diversity, Dominant organisms, Animal pathology, Plant groupings, Plant growth, Plant populations, Succession, Marine algae, Rhodophyta, Marine benthos.

The mass mortality by disease of a localized population of sea urchins, Strongylocentrotus, on the seaward side of a kelp forest was followed by the rapid seward expansion of 4 species of brown algae, Macrocystis pyrifera, Laminaria dentigera, Pterygophora california, and to a lesser extent, Nereocystis leutkeana. One other brown alga, Cystoseira osmundacea, failed to become established in the newly available area. Competition among M. pyrifera, L. dentigera, P. californica, and N. leutkeana apparently was severe, and within 1 year after the demise of the sea urchin, M. pyrifera formed a dense, nearly monospecific stand. Experimental removal of M. pyrifera demonstrated that the canopy of these plants limited light penetration to levels below that necessary for the growth and survival of other brown and red algae. (Deal-EIS)

Marine Pollution Bulletin, Vol. 10, p 56-59, 1979. 2 fig, 2 tab, 20 ref.

Descriptors: *Marine algae, *Heavy metals, *Mine wastes, *Chaetomorpha, *Enteromorpha, *Tissue analysis, Iron, Manganese, Lead, Zinc, Nutrients, Adaptation, Chemical analysis, Calcium, Potassium, Magnesium, Sodium, Cytological studies.

The two marine algae, Chaetomorpha brychagona and Enteromorpha crinita are found abundantly on the iron ore tailings of Tolo Harbour, Hong Kong, with a rather high level of various metals. Tissue analysis of the algae revealed that the contents of heavy metals (Fe, Mn, Pb and Zn) were higher than in the population collected from two uncontaminated sites faraway from the tailings. It was suggested that the algae were able to adapt to such a harsh environment with a comparatively high level of trace elements and the lack of basic nutrients. However, further studies are needed before any conclusion can be drawn. The delicate situation of the land-locked sea, Tolo Harbour, where the tailings and future heavy industrial site are situated, should not be overlooked. (Deal-EIS)

RELATION BETWEEN TOXICITY AND ACCUMULATION OF VARIOUS CHLOROPHENOLS IN GOLDFISH,
Kyushu Univ., Fukuoka (Japan). Faculty of Agriculture.
K. Kobayashi, H. Akitake, and K. Manabe.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 45, No. 2, p 173-175, 1979. 3 fig, 1 tab, 7 ref.

Descriptors: *Phenols, *Toxicity, *Bioaccumulation, *Tissue analysis, *Chlorophenols, *Goldfish, *Carassius, Chlorine, Chlorination, Chemical properties, Lethal limit, Mortality, Fish physiology, Animal metabolism, Organic compounds, Chemical analysis.

A study was made of the relation between the toxicity and the accumulation in goldfish, Carassius auratus, of seven chlorophenols: 2-chlorophenol; 4-chlorophenol; 2, 4-dichlorophenol; 2, 4, 5-trichlorophenol; 2, 4, 6-trichlorophenol; 2, 3, 4, 6-tetrachlorophenol; and pentachlorophenol. An increase of the Cl-atom number in the chlorophenols caused an abrupt increase in toxicity to the fish and also increased the concentration ratios in their media to lethal or sublethal concentrations. The results suggest that the increase of toxicity from polychlorinated phenols is mostly due to their accumulation in the fish. Their concentrations in the fish eventually achieve a certain lethal level (roughly 100-200 micro/g body weight), although the chemical form, locality, and physiological activity of the chlorophenols in the tissues of the fish must also be involved. (Deal-EIS)

TRENDS IN APPLIED PHYCOLOGY WITH A LITERATURE REVIEW: SEAWEED FARMING ON AN INDUSTRIAL SITE,
Department of Marine Botany, Goteborg (Sweden).
G. Michanek.
Botanica Marina, Vol. 21, p 469-475, 1978. 7 ref.

Descriptors: *Marine algae, *Kelps, *Phycology, *Seaweed, Marine plants, Foods, Phytoplankton, Biomass, Phaeophyta, Aquiculture, Plant physiology, Algae, Human diseases, Sewage.

Some aspects of trends in seaweed utilization are given as an introduction to a list of papers published during the last five years, pertinent to seaweed cultivation. Ocean farming projects of billion dollar magnitude are planned for energy recovery, to take over when natural gas sources are exhausted. Greenhouse cultivation methods are being elaborated to substitute for harvesting of natural resources and to give raw material of controlled chemical composition. Nutrient resources which have up to now been wasted through sewage can be taken advantage of, and their energy level raised, by plankton assimilation. In developing countries, harvesting on sea shores is replaced by culturing on ropes and rafts. The use of algae as human food is declining except for in Japan, China and Korea, and priceless know-how is rapidly being lost. It is observed that one trend is missing: the possibility of using seaweed as a remedy for diseases with wide distribution and prevalence such as goitre and intestinal worm infections. (Deal-EIS)

CALANOID COPEPOD EGGS IN SEA-BOTTOM MUDS. IV. EFFECTS OF SOME ENVIRONMENTAL FACTORS ON THE HATCHING OF RESTING EGGS,
Hiroshima Univ. (Japan). Faculty of Fisheries and Animal Husbandry.
S. Uye, S. Kasahara, and T. Onbe.
Marine Biology, Vol. 51, p 151-156, 1979. 1 fig, 6 tab, 21 ref.

Descriptors: *Copepods, *Oxygen, *Salinity, *Water temperature, *Hatching, *Calanopia, *Labidocera, *Acartia, *Centropages, Bottom sediments, Reproduction, Oxygen requirements, Neritic, Japan, Benthic fauna, Plankton, Animal physiology, Seasonal.

The hatching of resting eggs of 6 species of marine calanoid copepods, recovered from neritic sea-bottom muds in the central part of the Inland Sea of Japan was examined under various environmental conditions (temperature, salinity, oxygen concentration, illumination and presence of bottom mud). Temperature and oxygen concentration were found to be important factors affecting hatching. The respective ranges of temperature in which the eggs of each species hatched correspond closely to the range of temperature at which the planktonic population of that species was observed in the natural environment. Extremely low oxygen concentrations in the water completely inhibited hatching in all species. A wide range of salinity and the presence of absence of illumination did not prevent hatching. lenofilomorpha, *Pseudohaplogonaria, *Archiloa, Radioisotopes, Radiochemical analysis, Sulfur, Animal physiology, Animal metabolism, Adaptation, Resistance.

Life in the sulfide system requires the ability to withstand the toxic effects of long-term sulfide stress. The adaptations of sulfide-system interstitial metazoans to sulfide stress have been investigated using 35S-sulfide. One possible adaptation, the total exclusion of sulfide at the body wall, could not be demonstrated. Sulfide-system turbellarians and gastrotrichs, however, consistently incorporated less 35S-sulfide during a 2-h incubation period than their surface-dwelling counterparts. Analysis of autoradiographs of the sulfide-system acoels Myopea , Solenofilomorpha, and Pseudohaplogonaria sp., and the surface-dwelling proseriate Archiloa revealed major differences in the concentration of 35S label in the body wall relative to the internal tissues. Timed uptake and loss experiments plus data from autoradiography showed that the label in the body wall was not permanently bound but, instead, was easily lost. The data indicate that a sulfide detoxification system exists in the body wall which uses an as yet unknown scavinging system to trap much of the sulfide that enters, detoxifies it, and releases the end-product to the medium. THE DISTRIBUTION OF HEAVY METALS IN THE HARD CLAM, MERCENARIA MERCENARIA, IN THE LOWER CHESAPEAKE BAY REGION,
Bigelow Lab. for Ocean Sciences, Boothbay Harbor, ME.
P. F. Larsen.
Estuaries, Vol. 2, No. 1, p 1-8, 1979. 1 fig, 4 tab, 23 ref.

Descriptors: *Clams, *Heavy metals, *Tissue analysis, *Mercenaria, *James River(Virginia), *York River(Virginia), *Cadmium, *Copper, *Zinc, Chesapeake Bay, Commercial shellfish, Salinity, Water chemistry, Chemical analysis.

Populations of the hard clam, Mercenaria mercenaria, were sampled at thirty sites in the lower Chesapeake Bay region in 1972 and 1973. Subsamples were taken for analysis for the trace metals cadmium, copper and zinc. Emphasis was placed on samples from the York and James Rivers, two very productive and commercially utilized clam grounds. The levels of metals determined were comparable to those reported from other regions except Southampton Water in the United Kingdom. Differences in levels between the York and James Rivers were statistically significant ($P < 0.001$) which indicates that the James River probably suffers from contamination by these metals. One metal, copper, varied significantly with the age of the organism whereas the other two, cadmium and zinc, varied with salinity. In Mercenaria the salinity of the sampling site must be considered before cadmium and zinc data can be interpreted. A standard action-level to denote pollution from copper would be adequate in this species. (Deal-EIS)

OBSERVATIONS ON THE ENVIRONMENTAL CHARACTERISTICS OF PULICAT LAKE,
Central Inland Fisheries Research Inst. Madras (India).
M. Kaliyamurthy.
Journal of the Marine Biological Association of India, Vol. 16, No. 3, p 683-688, 1974. 4 fig, 18 ref.

Descriptors: *Monsoons, *Lakes, *Water analysis, *Seasonal, Water temperature, Salinity, Dissolved oxygen, Hydrogen ion concentration, Productivity, Fish populations, Tidal effects, Tidal waters, Neritic, Water circulation, India, Pulicat Lake.

Observations made during the years 1968 through 1970 on the spatial and temporal variations in temperature, salinity, dissolved oxygen and pH in Pulicat Lake are presented. Water temperature showed double oscillation in its seasonal changes, whereas salinity had a single peak during May/June. From the mouth to the upper reaches of the lake there was a decreasing salinity gradient during monsoon and postmonsoon, which became more or less reversed during premonsoon and summer. Higher values of dissolved oxygen were observed during monsoon and postmonsoon when compared to summer and premonsoon. Hydrogen ion concentration showed an inverse relationship with oxygen. Wider fluctuations in the environmental parameters were observed in the northern sector of the lake and the probable reasons for this are discussed. An attempt has been made to correlate the variations in salinity with the fish production of the lake. (Deal-EIS)

N15/N14 RATIOS OF GROUND-WATER NITRATE, LONG ISLAND, NEW YORK,
Texas Univ. at Austin. Bureau of Economic Geology.
C. W. Kreitler, S. E. Ragone, and B. G. Katz.
Ground Water, Vol 16, No 6, p 404-409, November-December 1978. 3 fig, 2 tab, 19 ref.

Descriptors: *Nitrogen, *Nitrates, *Isotope studies, *Groundwater, *Water pollution sources, Fertilizers, Animal wastes(Wildlife), *New York, *Long Island(NY), Nassau County(NY), Suffolk County(NY).

Nitrogen-isotope values of nitrate in water from the upper glacial aquifer are lighter in agricultural areas in eastern Long Island than in highly suburbanized areas in western Long Island. This reflects a shift in the dominant source of nitrate from fertilizer nitrogen and/or unfertilized cultivation nitrogen to a predominance of animal-waste nitrogen. Nitrogen-isotope values for nitrate in samples from the Magothy aquifer in Nassau and Suffolk Counties indicate that the nitrate is from a predominantly agricultural source with some animal wastes. Ground water in the Magothy aquifer is older than that in the upper glacial aquifer and should be representative of an older land-use pattern when agriculture was more widely practiced. Nitrogen-isotope values are lighter than those found in the overlying upper glacial aquifer in Nassau County, but heavier than those from the upper glacial aquifer in Suffolk County. (Woodard-USGS)

GROUND-WATER HYDROLOGY AND SUBSURFACE MIGRATION OF RADIOISOTOPES AT A LOW-LEVEL SOLID RADIOACTIVE-WASTE DISPOSAL SITE, WEST VALLEY, NEW YORK,
Geological Survey, Albany, NY. Water Resources Div.
D. E. Prudic, and A. D. Randall.
In: Management of Low-Level Radioactive Waste, Vol. 2, p 853-882, Pergamon Press, New York, 1979. 14 fig, 2 tab, 10 ref.

Descriptors: *Hydrogeology, *Solid wastes, *Underground, Waste disposal, *Radioactive wastes, *Path of pollutants, Groundwater, Tritium, Nuclear wastes, Infiltration, Groundwater movement, Groundwater recharge, Aquifer characteristics, Sampling, Water analysis, Evaluation, *West Valley(NY).

Burial trenches for disposal of solid radioactive waste at West Valley, N.Y., are excavated in till that has very low hydraulic conductivity (about 5 x 10 to the minus 8th power centimeters per second). Fractures and root tubes with chemically oxidized and/or reduced soil in their walls extend 3 to 4.5 meters below natural land surface. Preliminary simulations of pressure heads with a digital model suggest that hydraulic conductivity is an order of magnitude greater in the fractured till near land surface than at greater depth. Hydraulic gradients are predominantly downward, even beneath small valleys. The upper part of a body of underlying lacustrine silt is unsaturated; in the lower, saturated part, slow lateral flow may occur. In the older trenches, water began to build up in 1971, overflowed briefly in 1975, and was pumped out in 1975-76. Water levels rose abruptly during major rainstorms in mid-1975, indicating rapid infiltration through cracks in the cover material. The new trenche has maintained low, stable water levels, perhaps because of thicker, more compact cover and less waste settlement; pressure heads near these trenches are low, locally approaching zero, perhaps because of slight infiltration and limited near-surface storage. Peak tritium concentrations in test-hole cores (generally 0.00001 to 0.001 microcuries per milliliter) were found within 3 meters of land surface and are attributed to surface contamination. Concentrations declined rapidly with depth within the fractured till; secondary peaks found at about 9 meters in three holes are attributed to lateral migration from trenches. Other radioisotopes were detected only near land surface. Samples from the walls of shallow fractures revealed no accumulation of radioisotopes. (Woodard-USGS)

THE SOURCES AND BEHAVIOR OF HEAVY METALS IN WASTEWATER AND SLUDGES,
Battelle Columbus Lab., OH.
B. W. Vigon, R. A. Craig, and N. A. Frazier.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 006, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-070, 1977. 63 p, 26 tab, 41 ref.

Descriptors: *Heavy metals, *Sewage sludge, *Treatment facilities, *Water pollution sources, *Industrial wastes, Urban runoff, Agriculture, Peak loads, Waste water treatment, Municipal wastes.

A review of the literature available on the point and non-point sources and behavior of heavy metals in municipal waste water treatment plants and in sewage sludges was prepared. Inconsistent results were found in previous studies of heavy metals in municipal waste water. The heavy metal concentrations from residential sources varied significantly with the element studied and the geographic location. The residential contribution of heavy metals was rarely more than 50% of the total load. Inconsistencies among previous studies were attributed to the inclusion of unsurveyed industrial discharges. The correlation of heavy metal content in sludge with industrial density was considered inappropriate since diffuse sources of heavy metals such as laundries, street runoff, and family-owned operations can contribute to concentrations from a supposedly residential section. Because peak flows are usually bypassed, the contribution of urban runoff to metal levels at treatment plants was not considered significant compared to other sources. Individual studies of point-source heavy metals were considered necessary in areas where municipal sewage sludge containing heavy metal concentrations exceeding acceptable limits is used for agricultural purposes. (Lisk-FRC)

RESULTS OF INVESTIGATIONS, T. E. MAXSON WTP AND SIGNIFICANT INDUSTRIAL CONTRIBUTORS, MEMPHIS, TENNESSEE,
Report EPA-904/9-77-005, 1977. 236 p, 10 fig, 65 tab, 13 ref, 5 append.

Descriptors: *Treatment facilities, *Design flow, *Design data, *Pollutant identification, *Discharge measurement, Industrial wastes, Organic loading, Bioassay, Activated sludge, Oxidation lagoons, Waste water treatment, Municipal wastes.

Operation and maintenance investigations, bioassay toxicity studies of plant influent and effluent, and waste characterization studies of significant industrial waste water contributors were performed at the T. E. Maxson waste water treatment plant in Memphis, TN, to determine the capability of the plant to treat present and projected waste loads, to characterize the significant waste sources discharging into the collection system, and to verify previous performance data. The 80 mgd contact stabilization activated sludge plant was designed to reduce BOD by 85% and suspended solids by 90% but study data indicated that the plant achieved removals of 69% BOD, 54% COD, and 45% total suspended solids. The average waste water flow was 49% of the design capacity while the organic loading as BOD was 104% of the design load and as high as 140% on one study day. The plant influent had significant amounts of chlordane, chloroform, ramrod, and terpineol isomer; significant amounts of these substances were also found in the plant effluent. Influent and effluent were toxic to waterfleas and bluegill sunfish; while the toxic compounds could not be identified, chlordane and atrazine found in the waste water had been found toxic in other bioassays. The contact stabilization process and digesters did not receive enough air for proper operation; the plant received shock loadings; restricted hydraulic conditions prevented the plant from operating at design flow; and mechanical problems were identified. Some of the 162 industrial waste water discharges were investigated. (Lisk-FRC)

FINAL REPORT ON FATE OF METALS APPLIED IN SEWAGE AT LAND WASTEWATER DISPOSAL SITES,
Texas A and M Research Foundation, College Station.
K. W. Brown, C. Woods, and J. F. Slowey.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A043 363, Price codes: A15 in paper copy, A01 in microfiche. Report, 1975. 344 p, 52 fig, 27 tab, 59 ref, 9 append.

Descriptors: *Heavy metals, *Soil types, *Soil profiles, *Leachate, *Lysimeters, Waste water disposal, Copper, Zinc, Cadmium, Nickel, Lead, Bermuda grass, Sampling, Root zone, Waste water treatment, Municipal wastes, Sewage.

The fate of copper, zinc, cadmium, nickel, and lead contaminants in secondary sewage effluent applied to four different soils at waste water disposal sites was investigated. Five undisturbed monoliths of each soil type were enclosed in drainage lysimeters, and field plots of two of the soils were similarly established. The effluent samples, bearing 1 ppm of each of the metal contaminants, were applied at an average rate of 2.7 cm/wk for one year. Rainfall was excluded from the plots. Heavy metal concentrations were analyzed in samples of Bermuda grass, soil samples at a series of depths, and samples of water in the root zone from the bottom of the lysimeters. The total metal content, and the soluble, exchangeable, and organic bond fractions in the soil samples were also investigated. The effects of pH adjustment of the sewage effluent, rainfall, and the application of primary clarified effluent on the fate of the metals were examined. Other hydrologic and meteorological data were also monitored. Metals accumulated primarily in the top 12.5 cm of soil with the greatest concentrations found at the surface. The movement of metals downward through the soils were slow; no metals appeared in leachate collected at 75 cm and 150 cm in any of the soils. Vegetation uptake of the metals was minimal during the study. (Lisk-FRC)

WASHINGTON STATE REFINERIES: PETROLEUM, PETROLEUM DERIVATIVES AND WASTEWATER EFFLUENT CHARACTERISTICS,
Oceanographic Inst. of Washington, Seattle.
J. T. Pizzo, T. L. Johnson, and G. W. Harshman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-283 401, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/7-78-040, 1978. 169 p, 21 fig, 70 tab, 121 ref, 3 append (on fiche).

Descriptors: *Oil industry, *Oil wastes, *Effluent streams, *Performance, *Waste water treatment, Phenols, Sulfides, Chromium, Water pollution sources, Waste water treatment, Industrial wastes.

Refinery waste water effluent characteristics in Washington State were studied to detail the types of petroleum and petroleum derivatives that potentially could reach the Puget Sound. Information was collected on the chemical characteristics, amounts processed, and final disposition of crude oils, refined products, and waste water effluents associated with the six Puget Sound refineries. The amounts and types of petroleum and its derivatives handled by Puget Sound refineries and the amounts typically reaching marine waters are described. The refining and waste treatment processes employed by area refineries are described in detail. The final treated effluent contains a wide variety of chemical constituents and characteristics as it is virtually impossible to completely eliminate the pollutants which arise from crude oil refining. Average effluent level of phenols was 0.4 ppm, total oils was 5-10 ppm, sulfides was 0 ppm, mercaptans was 0 ppm, and total chromium was 0.1. (Small-FRC)

CONTROLLING PCB DISCHARGES TO THE ENVIRONMENT,
New York State Dept. of Environmental Conservation, Albany. Div. of Pure Waters.
N. A. Curry.
In: Proceedings of the 23rd Ontario Industrial Waste Conference, June 13-16, 1976, Toronto, Ontario, p 449-473. (1976) 2 fig, 4 tab, 7 ref, 1 append.

Descriptors: *Polychlorinated biphenyls, *Waste disposal, *Landfills, *Regulation, Leachate, Pesticide residues, Water pollution sources.

The control of PCB discharges to the environment and control over the disposal of discarded units containing PCBs are discussed. Manufacturing plants have discharged PCBs dissolved in the water, adsorbed onto suspended solids, dispersed in droplets, or dissolved in any oil or grease in the water effluent. At the Hudson Falls Plant of General Electric, about 38 ppb PCB was found in the inlet water. After suspended matter was removed, there was less than 1 ppb PCB. Discharges of PCBs tend to cycle from air to water to soil. Past landfills contain an estimated 300,000,000 pounds of PCBs and 750,000,000 pounds are in sealed units

in use. Regulation of disposal of discarded units is required, and new chemical landfills must be provided to contain leachate for complete destruction. Use must be limited and regulated to prevent discharge and rupture. Adequate substitutes for PCBs must be developed. (See also W79-07849) (Small-FRC)

MANUAL FOR THE CONTROL OF HAZARDOUS MATERIAL SPILLS. VOLUME ONE. SPILL ASSESSMENT AND WATER TREATMENT TECHNIQUES,
Envirex, Inc., Milwaukee, WI. Environmental Sciences Div.
K. R. Huibregtse, R. C. Scholz, R. E. Wullschleger, J. H. Moser, and E. R. Bollinger.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 734, Price codes: A21 in paper copy, A01 in microfiche. Report EPA-600/2-77-227, 1977. 471 p, 94 fig, 45 tab, 83 ref.

Descriptors: *Hazards, *Accidents, *Assessments, Public health, Safety.

A manual for the control of hazardous waste spills using improvised treatment systems is presented. The following topics are covered: notification, information sources, identification and assessment, determination of the best method for spill handling, safety consideration and process design, process construction and operation, and process components and treatment chemicals, and standard operating procedures during cleanup. The manual emphasizes spill control although prevention techniques are reviewed. The CHRIS-Vol. 3 Hazard Assessment is recommended for establishing human danger potential. Necessary treatment schemes are included for 303 hazardous wastes. Necessary safety procedures and process designs are presented. (Small-FRC)

COAL MINE WATER POLLUTION - LEGAL AND REGULATORY ISSUES: A SURVEY,
A. B. Fisher.
Illinois Institute of Natural Resources, Chicago, Illinois, Document No. 78/33, October, 1978, 43 p.

Descriptors: *Coal mine wastes, *Water quality standards, *Water pollution control, Economic impact, Chlorides, Sulfates, Dissolved solids, Effluents, Water pollution, Regulation, Legislation.

Legal and regulatory issues are surveyed regarding coal mine water pollution in 6 states: Colorado; Indiana; Kentucky; Ohio; Pennsylvania; West Virginia; and Wyoming. No state has sought to impose expensive treatment technology upon coal mine operators, but they have resorted to the following strategies: (1) mine discharges being diverted to an alternate watershed (Ohio); (2) violations of water quality standards being ignored (Pennsylvania); (3) water quality standards which would place a burden on coal mine operators not being promulgated in the first place or being easily removed if compliance is economically or technically infeasible (West Virginia); (4) streams which only exist when it rains but which may receive discharges from coal mining operation being excluded from water quality standards (Kentucky); (5) streams or stream segments which have been severely polluted by coal mine drainage through time being exempt from water quality standards (Ohio). Four appendices contain the following information: (1) a comparison of typical coal values for each state; (2) a comparison of the number of bituminous coal mines for each state; (3) the demonstrated coal reserves for each state; and (4) the agency in each state designated to coordinate the 1977 Surface Mining Control and Reclamation Act. EXPANDED OFFSHORE LEASING AND THE MANDATES OF NEPA,
J. E. McDermott.
Natural Resources Lawyer, Vol. 10, No. 3, p 531-53, 1977.

Descriptors: *Continental shelf, *Oil, *Leases, *Administrative agencies, Environmental effects, Environment, Oil pollution, Offshore platforms, Administrative decisions, Water pollution, Judicial decisions.

To reduce America's growing dependence on foreign oil, the United States Department of the Interior has been progressing rapidly with its plans for accelerated nationwide oil and gas leasing on the Outer Continental Shelf (OCS). The legality of the Interior's decision to implement accelerated OCS leasing both nationwide and in Southern California is explored. In connection with its decision, the Interior undertook environmental review procedures of questionable legality and propriety: (1) it failed to recirculate for further public comment a draft of a substantially amended programmatic Environmental Impact Statement (EIS); and (2) it undertook significant tract activities, including a tract specific environmental review process in Southern California, before the release of a final programmatic EIS and before the decision to implement the national leasing program. As a result, the integrity of the Interior's decisionmaking process was potentially compromised. More importantly, if the same procedures are adopted by other agencies in similar environmental review contexts, the future viability of the National Environmental Policy Act's environmental review process could be jeopardized. AN INTENSIVE STUDY OF THE HEAVY HYDROCARBONS IN THE SUSPENDED PARTICULATE MATTER OF SEAWATER,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
P. L. Parker, and S. Macko.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry,' Texas University Marine Science Institute, Supplemental Reports to Contract AA550-CT6-17, to the Bureau of Land Management, p 11-1 - 11-30, 1979. 13 fig, 10 tab. AA550-CT6-17.

Descriptors: *Texas, *Aromatic compounds, *Water pollution sources, Environmental effects, Water pollution effects, Baseline studies, Resources development, *Outer Continental Shelf, *Hydrocarbons, Petrogenic hydrocarbons, Suspended particulates, South Texas Outer Continental Shelf(STOCS).

Samples of particulate matter taken at three stations along Transect II were analyzed by GC and GC/MS/Data System. Total particulate hydrocarbon concentrations were found to decrease with distance offshore. The concentration of higher molecular weight hydrocarbons(C28 - C30) however, remained relatively constant. Such a distribution could be explained by production/introduction of hydrocarbons inshore with subsequent movement offshore. Preferential retention to higher molecular weight hydrocarbons during weathering could account for their more uniform concentration. Polycyclic aromatic compounds were found in benzene eluates of each sample. Among the compounds identified were: alkyl naphthalenes, phenanthrenes and dibenzothiophenes. Fluoranthene and pyrene were also found. A petroleum origin for the aromatics is likely. (Sinha-OEIS)

MODELING HIGHLY TRANSIENT FLOW, MASS, AND HEAT TRANSPORT IN THE CHATTAHOOCHEE RIVER NEAR ATLANTA, GEORGIA,
Geological Survey, NSTL Station, MS. Water Resources Div.
H. E. Jobson, and T. N. Keefer.
Geological Survey open-file report 79-270, January 1979. 139 p, 43 fig, 4 tab, 30 ref.

Descriptors: *Open channel flow, *Model studies, *Mathematical models, *Streamflow, *Heat transfer, Thermal pollution, Hydroelectric plants, Reservoir releases, Path of pollutants, Dye releases, Tracking techniques, Tracers, Water temperature, Hydrologic data, Equations, Evaluation, Georgia, *Chattahoochee River, *Buford Dam, *Norcross(Ga), Transport modeling.

A coupled flow-temperature model has been developed and verified for a 27.9-km reach of the Chattahoochee River between Buford Dam and Norcross, Ga. Flow in this reach of the Chattahoochee is continuous but highly regulated by Buford Dam, a flood-control and hydroelectric facility located near Buford, Ga. Calibration and verification utilized two sets of data collected under highly unsteady discharge conditions. Existing solution techniques, with certain minor improvements, were applied to verify the existing technology of flow and transport modeling. A linear, implicit finite-difference flow model was coupled with implicit, finite-difference transport and temperature models. Both the conservative and nonconservative forms of the transport equation were solved, and the difference in the predicted concentrations of dye were found to be insignificant. The temperature model, therefore, was based on the simpler nonconservative form of the transport equation. (Woodard-USGS)

LAND USE INFLUENCES ON METALS IN STORM DRAINAGE,
Geological Survey, Columbus, OH. Water Resources Div.; and Occoquan Monitoring Lab., Manassas, VA; and Virginia Polytechnic Inst. and State Univ., Blacksburg.

D. R. Helsel, J. I. Kim, T. J. Grizzard, C. W. Randall, and R. C. Hoehn.
Journal of the Water Pollution Control Federal, Vol. 51, No. 4, p 709-717, April 1979. 7 fig, 8 tab, 3 ref.

Descriptors: *Water pollution sources, *Heavy metals, *Land use, *Surface waters, *Watersheds(Basins), Runoff, Path of pollutants, Farms, Forests, Urban runoff, Storm runoff, Water analysis, Zinc, Lead, Chromium, Copper, Cadmium, Iron, Manganese, Virginia, *Occoquan watershed, *Four Mile Run watershed.

Swale washoff in rural areas and storm sewer discharges in developed subbasins, are an important factor in the declining water quality of the Occoquan Reservoir in Virginia. Data are presented for the watershed tributary to this reservoir, along with the Four Mile Run watershed near the Washington, D.C., city line. The two basins drain lands ranging from farms and undisturbed forests in the Occoquan headwaters to commercial and high-density residential areas along Four Mile Run. The purpose of the study was to characterize and compare the surface runoff of seven metals from small basins of differing land use types. Many metals are required by organisms as micronutrients. Yet at higher concentrations they can be toxic, with the toxicity level depending on the metal, the organism exposed, and the chemical environment. The metals analysed are zinc, lead, chromium, copper, cadmium, iron and manganese. (Woodard-USGS)

DEVELOPMENT OF METHODS FOR SAMPLING, PRESERVING AND ANALYZING CONTAMINATED GROUND WATERS AND AQUIFER SEDIMENTS,
Department of the Environment, Ottawa (Ontario). Hydrology Research Div.
A. E. Jackson.
In: Hydrology Research Division, Annual Progress Reports and Short Research Notes, 1977-78. p 32-42, 1979. 7 fig, 8 ref. Environment Canada Inland Waters Directorate, Ottawa, Report Series No. 64. HR 75-1.

Descriptors: *Path of pollutants, *Hydrogeology, Groundwater, *Water pollution, Analytical techniques, Measurements, Aquifer characteristics, Sampling, Sediments, Connate water, Strontium, Cesium, Perch Lake(Canada), Chalk River Nuclear Laboratories.

Progress is reported on the measurement of dissolved and sorbed contaminants in the groundwater flow system of the Lower Perch Lake Basin at the Chalk River Nuclear Laboratories (CRNL). Field measurement and sampling, preservation, and analysis were used to measure the hydrogeochemical parameters of the lake basin. The procedures for these processes and the equipment used are discussed. The method being developed at CRNL to obtain undisturbed samples of contaminated aquifer materials involves the use of a sediment sampler and the separation of the interstitial water from the samples. To determine the distribution coefficients for strontium 90 and cesium 137 the water and sediment samples are counted individually. Flow charts illustrate hydrogeochemical analyses and the procedures for sediment and interstitial water analysis. (Davison-IPA)

TOXIC SUBSTANCES IN OPEQUON CREEK, VIRGINIA,
Virginia State Water Control Board, Richmond.
J. W. Ayers.
Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 189-196, 7 fig, 1 tab, 8 ref.

Descriptors: *Pesticide residues, *Pesticide kinetics, *Pesticide toxicity, *Persistence, *Food chains, Aquatic populations, *Fish, Path of pollutants, Ecosystems, Monitoring, Pesticides, Organic pesticides, DDT, Dieldrin, Endrin, Polychlorinated biphenyls, Water analysis, Water pollution sources, Water quality, Opequon Creek(Virginia).

A 13-month monitoring program was conducted during 1973 and 1974 on the Opequon Creek, Virginia, to examine the extent of biological accumulation of toxic pesticide residues in an aquatic ecosystem. Samples of water, fish, and sediments were analyzed for all pesticide compounds to locate phases of the environment in which pesticide residues were concentrated, to determine variations in seasonal pesticide occurrences, and to evaluate the importance of the food chain in biological accumulation of pesticide residues. Data on pesticide residues in fish tissues and bottom sediments were updated during an August 1976 survey. Pesticides and their uptake by fish are emphasized in a discussion of the theoretical concepts of biological accumulation of toxic substances. Of the 195 water samples analyzed, 38% were contaminated with one or more pesticides. A total of 13 pesticide compounds were found, most of which were organochlorines; organophosphates and herbicides were also present. Pesticide residues in the water correlated with pesticide application activity. The lower food chain level exhibited the highest contamination level; the upper food chain level had the lowest total residue levels of all fish collected, supporting the theory of direct environmental uptake of pesticides. Fish collected at the end of the heavy pesticide application period in August had higher residues than those collected in February, the slack period for pesticide application activity. The results indicate that persistent organochlorine pesticide residues may be diminishing because fewer of these chemicals are used in agriculture. (Davison-IPA)

STORM RUNOFF AND COMBINED SEWERS IN WASHINGTON, D. C.,
American Univ., Washington, DC. Dept. of Biology.
M. A. Champs.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 151-154, 7 fig, 12 ref. Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2.

Descriptors: *Combined sewers, *Discharge measurement, *Overflow, *Rainfall-runoff relationships, *Organic loading, *Carbon, *Discharge(Water), *Sewerage, Nutrients, Water pollution, Water pollution sources, Storm runoff, Average runoff, Potomac River, Washington(DC).

Storm loadings of dissolved and particulate organic carbon are summarized for the Washington, D. C. area. Dry flow, street runoff, and combined sewer overflow from residential and industrial areas are compared to the Potomac River yearly averages and storm crests. A National Pollutant Discharge Elimination System Discharge Permit (NPDES) was issued to the District of Columbia for discharges to the Potomac River and its tributaries for 72.2% of the city's total combined sewer acreage. Researchers found that a 'significant portion' of the total storm-water pollutional loads to the streams of the District of Columbia come from combined sewer discharges. Sanitary sewage contributes about half of the organic and more than 50% of the nutrient loadings in combined sewer discharges. The average organic and nutrient concentrations of rainfall runoff are about 1/3 of those in combined sewer discharges in the Washington, D. C. area. Factors affecting the loading intensity in storm and combined sewers and their overflows include: surrounding land use, the time elapsed since streets were cleaned, the degree of cleaning, local traffic volume and type, street surface type and condition, construction practices, public works practices, and season of the year. Dissolved and particulate organic carbon concentrations in street runoff, storm and combined sewers, and overflows were found to be four to 10 times higher than water samples from the Potomac River. (Davison-IPA)

URBAN RUNOFF AND THE STREAM LIFE OF THE OCCOQUAN,
Occoquan Water Shed Monitoring Lab., Manassas, VA.
J. T. Kim, T. J. Grizzard, C. W. Randall, and R. C. Hoehn.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 155-160, 6 fig, 1 tab, 12 ref. Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2.

Descriptors: *Urban runoff, *Water pollution sources, *Water pollution effects, *Water management, Nutrients, Phosphorus, Nitrogen, Heavy metals, Iron, Lead, Zinc, Rainfall, Runoff, Occoquan Reservoir(Virginia).

The Occoquan Reservoir, on a major tributary of the Potomac estuary, was impounded in 1957 to provide a raw water supply to the Virginia suburbs of Washington, D. C. Although waste water discharges continue to contribute a significant amount of the pollutional load on the impoundment, recent studies show that contribution from runoff sources is clearly important. Data were collected from three sub-basins (Stonewall Road, Irongate, and Manassas Mall) during a compound storm event in August 1976. No runoff occurred for nine days before the event. The precipitation total for each site was the same, but the total runoff volumes varied widely because of differences in impervious area and sub-basin size. The nitrogen (N) and phosphorus (P) content in the runoff exceeded the accepted limits by factors of 25 for N and 100 for P at times. The initial high peak valued appeared at the onset of runoff. Iron concentrations, highest at Irongate and Stonewall Road, were about 90% attached to suspended material. High concentrations of zinc and lead were observed for Irongate and Manassas Mall because of automobile operation at these sites. Although the high concentrations of zinc were within the acceptable ranges for public water supplies, those for lead exceeded the 0.05 mg/l limit. It is concluded that urban areas seem to have the capacity to export water pollutants from storm drainage at sufficient levels so that concern for the aquatic habitat becomes important. (Davison-IPA)

NUTRIENT MODELING,
Hydroscience, Inc., Arlington, TX.
P. J. Young.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 161-166, 5 fig, 3 tab, 2 ref. Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2.

Descriptors: *Mathematical models, *Nutrients, *Nutrient removal, *Evaluation, Regression analysis, River basins, River flow, Fluctuations, Nitrogen, Phosphorus, Potomac River, Water pollution, Water pollution sources, Pollution abatement, Luke(Maryland), Little Falls(Maryland), Potomac River basin.

A review of a recent study is presented in which the nutrient levels of the freshwater Potomac were determined, and the effectiveness of controls to lower these nutrient levels was evaluated. The investigation of the relationships between nutrient concentrations and flow included analyses of seasonal effects, sequences within individual runoff events, and regression analyses of concentration and loading rate versus flow. To characterize and determine the controllability of the nutrients reaching the estuary a mathematical model of the upper Potomac River was developed. The model, consisting of 47 segments from Luke to Little Falls, Maryland, is able to handle point and distributed loadings for conservative or non-conservative substances. Three basic steps were followed for each of the three distinct flow periods modeled. Step 1

involved setting up a calculation to include the estimated loadings to the main step from all sources contributing nutrients during the flow period. Step 2 was concerned with estimating the natural background effects and assumed no input from man's activities. The added effects of point sources are taken into account by Step 3. It was demonstrated that nitrogen and phosphorus seemed to behave non-conservatively during summer low flow periods. On an annual basis nitrogen was considered to behave conservatively throughout the basin, but phosphorus continued to demonstrate non-conservative characteristics. The effectiveness of controls to remove nutrients was computed with logarithmic regressions and the modeling analysis. The 11 specific conclusions resulting from this study are presented. MONITORING SPAWNING GRAVEL IN MANAGED FORESTED WATERSHEDS, A PROPOSED PROCEDURE,
Corvallis Environmental Research Lab., OR. Ecosystems Modeling and Analysis Branch.
M. A. Shirazi, D. H. Lewis, and W. K. Seim.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-294 273, Price codes: A02 in paper copy, A01 in microfiche. Report No. EPA-600/3-79-014, February 1979. 19 p, 2 fig, 3 tab, 8 ref.

Descriptors: *Aquatic habitats, *Spawning, *Water pollution, *Water pollution sources, *Sediments, Fish management, Fish conservation, Ecology, Environmental effects, Salmonids, Streambeds, Sampling, Gravels, Coarse aggregates, Gravimetric analysis, Water analysis, Forest management, Watershed management, Monitoring.

Because silvicultural activities in the Pacific Northwest introduce various levels of sediments and debris into streams degrading the spawning habitats of salmonid fishes, simple, reliable procedures are needed to monitor spawning substrate to assess the possible level of these impacts. A preliminary rationale for conducting such a monitoring program is presented for both individual spawning sites as well as for the entire stream. Spawning takes place in these mountain streams in riffles six to 36 inches deep with a water velocity of 1.5 to 2.5 ft/sec. The proposed monitoring procedure consists of the following steps: (1) select known spawning areas in stretches of a stream being impacted; (2) identify patches of spawning gravel and measure these areas; (3) estimate the range of gravel composition of each spawning riffle by sampling; (4) use a grab sampler under low water conditions after emergence; (5) three gallons or more of gravel to be collected, if gravel is coarse; (6) the gravel is to be wet-sieved on-site and the coarse fraction is to be analyzed volumetrically; (7) collect remaining gravel in 63 micron sieve, dry sieve in the laboratory and analyze gravimetrically; (8) estimate gravel density, combine analysis and determine geometric mean diameter; and (9) make a matrix--geometric mean diameter of all patches along the stream reach for comparison after impact. EFFECTS OF THERMAL DISCHARGE ON AQUATIC INSECTS IN THE TENNESSEE VALLEY,
Tennessee Valley Authority, Muscle Shoals, AL. Div. of Environmental Planning.
K. J. Tennesson, and J. L. Miller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-295 415, Price codes: A04 in paper copy, A01 in microfiche. Interagency Energy/Environment Research and Development Program Report No. TVA/EP-78-09 and EPA-600/7-78-128, July 1978. 60 p, 24 fig, 9 tab, 12 ref. E-AP 80-BDR.

Descriptors: *Biology, *Animal growth, *Thermal stress, *Biorhythms, *Insects, *Growth stages, *Environment, Thermal pollution, Heat resistance, Heated water, Hydrology, Limnology, Electric powerplants, Water pollution sources, Fecundity.

The burrowing mayfly, Hexagenia bilineata (Say), and the midge, Coelotanypus sp., were studied to determine their thermal tolerances, and to investigate their growth and emergence in the vicinity of Tennessee Valley Authority electric generating plants. The stages of the life cycle subject to thermal discharge from the electric generating plants were emphasized and include the eggs, the immatures (stationary or drifting), and the stage of emergence to the adult. The immature stages of both species showed great tolerance to thermal shocks of up to 20C, a greatly reduced mean percentage of hatching resulted when eggs were subjected to a shock of 15C, and egg development was limited at a constant temperature of 37C. Nymphal growth was greater in areas where the thermal plume extends to the bottom during the winter and spring than in ambient areas. In late spring development in the ambient areas accelerated, and adults emerged at about the same date in both areas. No significant differences in size and fecundity were observed for H. bilineata females emerging from either area, but males emerging from thermal plume areas were larger than those emerging from ambient areas. The differences in mayfly biology were not expected to adversely affect the species in the study area. (Davison-IPA)

INFLUENCE OF A BARITE TAILINGS POND RUPTURE ON THE FISHES OF BIG RIVER, MISSOURI,
Maryland Univ., Frostburg. Appalachian Environmental Lab.
C. H. Hocutt, J. R. Stauffer, Jr., and P. A. Mills.
In: Surface Mining and Fish/Wildlife Needs in the Eastern United States, Proceedings of a Symposium, U.S. Fish and Wildlife Service, Morgantown, West Virginia, December 1978. Report No. FWS/OBS-78/81, p 177-189, 1978. 1 fig, 11 tab, 35 ref.

Descriptors: *Water pollution, *Environmental effects, *Fish populations, *Fish behavior, *Water pollution effects, Sampling, Aquatic environment, Turbidity, Water quality, Mine wastes, Strip mine wastes, Big River(Missouri), Mill Creek(Missouri), Buss Branch(Missouri).

The fish of the Big River, Mill Creek, and Buss Branch in Missouri were sampled at 27 stations during 1975 and 1976 to determine the effects of a barite tailings pond rupture on these fish. Twenty-two stations located above and below the discharge points of Buss Branch into Mill Creek and Mill Creek into Big River were sampled during 1975, and data obtained were compared with sampling results obtained just prior to the tailings pond rupture. This comparison showed that Mill Creek, where the tailings pond was located, suffered a nonselective stress and the fish community was reduced in numbers of species and specimens; the effects of the tailings pond rupture on the fish community of Big River were negligible. During the 1976 survey the 18 stations sampled did not necessarily correspond to those sampled in 1975, because the study objectives differed. Condition factors were calculated for several species to determine if the spill had long-term indirect effects on their healthiness. The fish populations of Mill Creek had recovered significantly in 1976, so that they were probably equivalent to those before the spill. (Davison-IPA)
W79-07507

INERTIA AND ELASTICITY AS A STREAM CLASSIFICATION SYSTEM: YOUGHIOGHENY RIVER CASE HISTORY EVALUATION,
Maryland Univ., Frostburg. Appalachian Environmental Lab.
J. R. Stauffer, Jr., C. H. Hocutt, M. L. Hendricks, and S. L. Markham.
In: Surface Mining and Fish/Wildlife Needs in the Eastern United States, Proceedings of a Symposium, U. S. Fish and Wildlife Service, Morgantown, West Virginia, December 1978, Report No. FWS/OBS-78/81, p 105-118, 1978. 1 fig, 6 tab, 28 ref.

Descriptors: *Rivers, *Eutrophication, *Mining wastes, *Environmental effects, *Watershed management, *Habitat improvement, *Youghiogheny River, Sampling, Fish population, Streams, Monitoring, Fish migration, River systems, Wildlife management, Aquatic habitats, Ecosystems.

The feasibility of using a stream classification system based on the concepts of inertia and elasticity as applied to data obtained on the Youghiogheny River is examined. Inertia, the ability of a stream to withstand a particular stress without eliciting a structural or functional change, can be calculated before a stress occurs. Elasticity is the ability of a system to recover once functional or structural change has occurred. Since only half the parameters used to calculate elasticity can be evaluated prior to stress because the type and intensity of a potential stress is unknown, inertia may be more useful in establishing a stream classification system. Structural and functional redundancy are major factors for calculating inertia. It is noted that functional redundancy was based only on tropic-level interaction. Structural redundancy, calculated by counting the number of species present in a particular family, implies functional redundancy. It was observed that areas with the highest inertia were not necessarily highest in elasticity. It is concluded that high inertia, low elasticity areas should be strictly managed as refugia. OPPORTUNITIES FOR MAINTENANCE REHABILITATION OF RIPARIAN HABITATS: EASTERN UNITED STATES,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
J. Cairns, Jr., J. R. Stauffer, Jr., and C. H. Hocutt.
In: Strategies for Protection and Management of Floodplain Wetlands and Other Riparian Ecosystems, National Symposium, December 11-13, 1978, Callaway Gardens, Georgia, Johnson, R. R., and McCormick, J. F., Eds., p 304-317, 1979. 10 tab, 31 ref. U.S. Dept. of Agriculture, Forest Service, Washington, DC. GTR-WO-12. E-(40-1) 4939.

Descriptors: *Riparian waters, *Maintenance, *Rehabilitation, *Ecosystems, Baseline studies, Biological properties, Chemical properties, Physical properties, Pollutants, Monitoring, Evaluation, Aquatic habitats, Aquatic organisms.

The maintenance of ecosystem quality requires the following basic components: (1) a baseline biological-chemical-physical study of the present condition; (2) a hazard evaluation based on knowledge of known potential pollutants entering the system and the estimated biological response to them; and (3) a biological-chemical-physical monitoring system designed for early warning of imminent harm. Difficulties encountered in the rehabilitation of an ecosystem include: (1) the original condition may not be known, (2) the ecological means of rehabilitation may not be possible or understood, (3) the cost may be prohibitive, and (4) a species may have been genetically altered after a long exposure to a man-made phenomenon. Two examples in which society's resistance to ecosystem rehabilitation was overcome are discussed. The characteristics of ecosystem vulnerability include inertia, the ability of a system to resist displacement of structural and functional characteristics, and elasticity which is the ability to recover from damage. Calculations of inertia indices and elasticity indices are presented. All of the parameters suggested can be used to calculate the inertia index, but the practical use of the elasticity index is limited by the lack of present information on dispersal rates of fishes and other aquatic organisms. It is concluded that maintenance and rehabilitation of riparian habitats in the eastern United States is possible with existing technology, and that water quality can be maintained through biological assessment and monitoring. (Davison-IPA)

LARVAL FISH DISTRIBUTION IN SOUTHWESTERN LAKE ERIE NEAR THE MONROE POWER PLANT,
Michigan State Univ., East Lansing. Inst. of Water Research.
R. A. Cole.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 629, Price codes: A05 in paper copy, A01 in microfiche. Report No. EPA-600/3-78-069, July 1978. 73 p, 3 fig, 10 tab, 23 ref, 1 append. R804517010.

Descriptors: *Fish populations, *Fish migration, *Larvae, *Entrainment, *Electric power production, *Western Lake Erie, Environmental effects, Sampling, Equipment, Plankton nets, Ecosystems, Fish establishment, Density, Turbidity, Turbulence.

Quantitative sampling of larval fish in western Lake Erie and the sampling techniques employed are discussed. Daytime and nighttime tows of 1-m plankton nets were used to sample distributions in the coastal zone. Here, the larvae occur in very dilute, shifting, aggregated concentrations. Studies were conducted to contrast day and night sampling efforts and densities in different levels of the water column. The larvae of all abundant fish species near the Monroe Powerplant concentrated near the bottom during the day and dispersed throughout the water column at night, implying that representative daytime sampling depends on the effectiveness of the gear next to the bottom. Depth, turbidity and turbulence vary with distance from shore and could influence gear effectiveness during daytime studies. Larval fish were sampled in flooded tributary valleys and backwaters to contrast with samples from the beach front and further offshore. Prolarvae were concentrated near spawning sites; larvae reaching the lake were rapidly dispersed by currents. Density and mortality sampling in the powerplant cooling system revealed certain larval species were more vulnerable to entrainment: gizzard shad were more vulnerable than yellow perch, white bass, carp, and goldfish. AQUATIC DISPOSAL FIELD INVESTIGATIONS ASHTABULA RIVER DISPOSAL SITE, OHIO, APPENDIX C, INVESTIGATION OF WATER-QUALITY AND SEDIMENT PARAMETERS,
State Univ. of New York Coll. at Buffalo. Great Lakes Lab.
R. K. Wyeth, and R. A. Sweeney.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-77-42, July 1978. 344 p, 3 append, 15 tab, 106 fig, 33 ref.

Descriptors: *Aquatic environment, *Lake Erie, *Sediments, *Water quality, Benthos, *Dredged material, *Ashtabula River.

An investigation to evaluate impacts of the release of dredged material on chemical aspects of the aquatic and benthic environments was conducted in Lake Erie off Ashtabula, Ohio, from June 1975 through September 1976. Samples and measurements were taken prior to, during, and after the release of materials from a hopper dredge during August 1975 and May 1976. The impact on the water column was short-lived with a return to ambient pre-disposal conditions for most parameters within 90 minutes after release of dredged material. Impacts on interstitial water generally dissipated in less than 90 days after disposal. The benthic environment was the most affected in terms of chemical changes. A return to predisposal conditions did occur within a year primarily due to erosion. There was no evidence of heavy metals accumulations by either benthos or fish as a consequence of disposal of dredged material. A Standard Elutriate Test preparation time dependency study also was done. This investigation resulted in some suggested changes for improving reliability. (WES)

RESPONSE OF PHYTOPLANKTON AND BACTERIA TO WATER QUALITY IN THE CHOWAN RIVER, NORTH CAROLINA,
North Carolina State Univ. at Raleigh. Dept. of Botany.
O. C. Boody, IV.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 301, Price codes: A08 in paper copy, A01 in microfiche. MS Thesis, 156p, 1979. 26 fig, 2 tab. OWRT B-091-NC (1), 14-34-0001-6104.

Descriptors: *Phytoplankton, Water quality, *Algal growth, Algal blooms, Nitrogen, Organic phosphorus, *Primary productivity, Chowan River.

Simultaneous in situ measurements of primary productivity and heterotrophic activity using a new apparatus indicated daily and seasonal variations in activity. Using a single, uniformly labeled substrate (14C-glucose) at tracer levels, diurnal heterotrophic activity was measured as percentage uptake and mineralization. Primary productivity was measured using labeled (14C)NaHCO3 at four hour intervals throughout the daily photic period. Daily variation in peak bacterial activity was as much as 0.36% hr-1 to 13.8% hr-1. Variation in bacterial activity was also observed on a seasonal basis. Activity during summer and spring was generally highest during the hours before or just after sunrise. Autumn and winter activity, although lower than summer and spring, was at higher levels during the photic period. Primary productivity ranged from 2.73 x 10-3 u g Cl-1 hr-1 to 2.51 u g Cl-1 hr-1 at Tunis, N.C. and from 3.04 u g Cl-1 hr-1 to 6.66 u g Cl-1 hr-1 at Colerain, N.C. Algal productivity was generally skewed with peak activity during early morning. Population studies of algal and bacteria were undertaken at both Tunis and Colerain. Both populations were highest in summer and spring. The dominant algal groups during the summer were Diatoms at Tunis and Blue-greens at Colerain. Nutrient analyses indicated that winter buildup of inorganic N and inorganic P occurs and these elements are available for spring blooms when water temperature and light conditions become conducive. Multiple linear regressions of algae and bacteria populations vs. nutrient and some physical data were run to detect correlations. (Kiger-North Carolina)

Descriptors: *Algal control, Aquatic microbiology, *Biocontrol, *Chlorella, Algal toxins, Bacteria, Eutrophication, Nitrification, Hydroxylamine.

An actively nitrifying Arthrobacter sp. isolated from a lake inhibited the growth of Chlorella vulgaris. This was found to be due to hydroxylamine released by the bacterium during the oxidation of ammonium or other reduced nitrogen compounds. Plates containing Plate Count Agar streaked with Arthrobacter accumulated 5 micrograms ml-1 hydroxylamine-N. Chlorella was sensitive to less than 0.24 micrograms ml-1 hydroxylamine-N. Non-nitrifying bacterial isolates of lacustrine origin did not demonstrate inhibiting activity. Results indicate that nitrifying microorganisms may thus affect the population dynamics of algae in eutrophic lakes. (Godfrey-Mass)

DRINKING WATER AND HEALTH. PART I, CHAPTERS 1-5. A REPORT OF THE SAFE DRINKING WATER COMMITTEE,
National Academy of Sciences, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 422, Price codes: A25 in paper copy, A01 in microfiche. 1977. 582 p, 5 fig, 38 tab, 962 ref.

Descriptors: *Potable water, Water quality standards, *Microorganisms, *Suspended solids, *Solutes, *Public health, Toxicity, Water pollution effects, Lead, Arsenic compounds, Pesticides, Radioisotopes, Radiation, Chlorination.

A literature review is presented of the effects of the constituents of drinking water on human health. The risk to man was evaluated on the basis of both epidemiological studies and studies of toxicity in laboratory animals. Five classes of contaminants were investigated: microorganisms, particulate matter, inorganic solutes, organic solutes, and radionuclides. Chlorine has controlled microorganisms to an appreciable extent (10,000 cases of waterborne enteric disease were confirmed in 1975), but there are questions concerning toxicity of by-products and residuals in the distribution system. Fine particles are suspended in drinking water which may decrease the efficiency of disinfection, act as contaminant carriers, or perhaps produce toxic effects. Health effects associated with 22 inorganic solutes were reviewed, and reexamination of the current standards for lead, arsenic, and selenium was recommended. One hundred and twenty nine organic compounds including 55 pesticides were examined. Lifetime exposure risk of 22 known or suspected carcinogens was estimated, and an Acceptable Daily Intake (ADI) was calculated for 45 compounds judged potentially toxic but not carcinogenic. Radiation associated with water supplies is usually a small proportion of background radiation, but in a few cases, radium can reach concentrations that pose a higher risk of bone cancer. DRINKING WATER AND HEALTH PART 2, CHAPTERS 6 AND 7, A REPORT OF THE SAFE DRINKING WATER COMMITTEE,
National Academy of Sciences, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 423, Price codes: A23 in paper copy, A01 in microfiche. 1977, 508 p.

Descriptors: *Toxins, *Water sampling, *Pollutant identification, Chemical analysis, Toxicity, Water quality control, Pesticide toxicity, Water quality standards, Water supply, Insecticides, Herbicides, *Potable water, *Public health.

The potentially harmful effects on human health of some of the impurities in drinking water were studied. The organic contaminants identified in drinking water comprise a small fraction of the total organic matter present. Although approximately 90% of the volatile organics in drinking water have been identified and quantified, these represent no more than 10% of the total organic material. Only 5-10% of the non-volatile organic compounds, have been identified which comprise the remaining 90% of the total organic material in water. A cautious approach must be adopted when dealing with potentially harmful chemicals. For many of the organic compounds identified in drinking water, virtually no toxicity data is available. To determine those agents for which data is most needed, the following assignment of priorities was made: (1) The relative compound contration and the number of persons likely to be exposed; (2) The number of water systems in which the compounds occur; (3) Positive response to in virto (a) mutogenic screening systems; and (b) carcinogen pre-screening; (4) Similarity of a compound's chemical structure to others having defined toxic

properties; (5) Relationship of dose from water to total body burden. (See also W79-07590) (Fortin-Florida)

PSEUDODACTYLOGYRUS MICRORCHIS (MONOGENEA) ON THE GILLS OF CULTURED EELS-III EXPERIMENTAL CONTROL BY TRICHLORFON,
Fukui Prefecture Fisheries Experimental Station, Tsuruga (Japan).
R. Imada, and K. Muroga.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 45, No. 1, p 25-29, 1979. 3 fig, 1 tab, 4 ref.

Descriptors: *Animal parasites, *Worms, *Eels, *Pseudodactylogyrus, *Trichlorfon, *Formalin, Pesticides, Pesticide toxicity, Chlorinated hydrocarbon pesticides, Chlorides, Toxicity, Growth stages, Aquiculture, Fish parasites, Bioassay, Fish diseases, Fish, Fish hatchery.

In the first experiment, the effects of trichlorfon, formalin and sodium chloride baths on the control of Pseudodactylogylus microrchis on eels (Anguilla anguilla) were studied. 0.5 ppm.24 hour-bath of trichlorfon proved to be potentially practical in both effectiveness and harmlessness. In the second experiment, the effective method of treatment with 0.5 ppm-24hour trichlofon bath was examined. A double 0.5ppm-24 hour-bath of trichlorfon with an adequate interval was confirmed to be completely effective for the control of the worm. The second bath was found to be indispensable, because the eels became reinfected with the young forms hatched from eggs which were laid during the first bath. The interval between the first bath and the second bath depends on the time required for hatching of the eggs. A 3 day interval proved adequate at the experimental water temperature of 25.5-28C. GROWTH AND PRODUCTION OF AMPHIPODS GAMMARUS OLIVII AT DIFFERENT TEMPERATURES,
Akademiya Nauk USRS, Sevastropol. Dept. of Physiology of Aquatic Animals.
G. I. Abolmasova.
The Soviet Journal of Marine Biology, Vol. 4, No. 3, p 655-659, 1978. 1 fig, 3 tab, 14 ref. (Translated from Russian).

Descriptors: *Water temperature, *Growth rates, *Productivity, *Amphipoda, *Gammarus, Animal physiology, Growth stages, Crustaceans, Size, Mathematical studies, Biomass, Seasonal, Respiration, Animal metabolism.

The equation of dependence between the mass of Gammarus olivii before and after moulting at 5, 10, and 20C is calculated. It is shown that the absolute value of body mass increment during moulting is in direct proportion to the mass up to coulting. The empirical growth curves are S-shaped. The curves constructed on the basis of observations are in good agreement with the growth curves calculated in relation to phsiological indicators. The author demonstrates that with the increase of temperature the specific growth rate increases accordingly. (Deal-EIS)

REVIEW OF OXYGEN DEPLETION AND ASSOCIATED MASS MORTALITIES OF SHELLFISH IN THE MIDDLE ATLANTIC BIGHT IN 1976,
National Marine Fisheries Service, Highlands, NJ. Sandy Hook Sport Fisheries Marine Lab.
F. W. Steimle, and C. J. Sindermann.
Marine Fisheries Review, Vol. 40, No. 12, p 17-26, 1978. 6 fig, 41 ref.

Descriptors: *Mortality, *Clams, *Oxygen sag, *Middle Atlantic Bight, Eutrophication, Oxygen, Lobsters, Migration patterns, Migration, Fish migration, Animal behavior, Commercial shellfish, Biological communities, Waste disposal, Weather data, Weather patterns, Continental shelf.

In summer and autumn of 1976, mass mortalities of shellfish occurred in a 165-km long corridor of severe oxygen depletion paralleling the New Jersey coast from 5 to 85 km from shore. Mortalities of surf clams, Spisula solidissima, the most severely affected species, were estimated in excess of 140,000 t. Alteration of normal migration patterns of lobsters and several species of finfish was also noted. A series of anomalous meteorological and hydrological events (particularly early warming of surface waters resulting in early thermocline development, and a massive shelf-wide phytoplankton bloom) superimposed on an already stressed coastal area, was considered to be responsible. The occurrence is particularly significant because the continental shelf of the Middle Atlantic Bight, from Cape Cod to Cape Hatteras on the east coast of the United States, contains the largest known stocks of ocean shellfish of any comparable coastal area of North America. (Deal-EIS)

ELEMENTAL DISTRIBUTION IN RELATION TO SKIN NECROSES OF MARINE FLATFISHES FROM THE ENGLISH CHANNEL,
Westfield Coll., London (England). Dept. of Zoology.
P. F. Newell, T. C. Appleton, B. E. Brown, and J. W. Carnwarth.
Marine Biology, Vol. 51, p 93-99, 1979. 2 fig, 4 tab, 31 ref.

Descriptors: *Industrial wastes, *Fish diseases, *Fish parasites, *Skin necrosis, *Fin lesions, *Flatfish, *Limanda, *Pleuronectes, Platichthys, *Solea, *Tissue analysis, Animal pathology, Fish populations, Chemical analysis, Spectroscopy, Chemical wastes, Trace elements, Metals, Heavy metals, Sodium, Magnesium, Aluminum, Phosphorus, Sulfur, Chlorine, Potassium, Calcium, Iron, Copper, Zinc, Chromium, Water chemistry, Cadmium, Cobalt, Manganese.

It has been suggested that industrial waste discharges are associated with the occurrence of fin damage and skin lesions. A mixed population of diseased and healthy flatfish consisting of Limanda limanda, Pleuronectes platessa, Platichthys flesus and Solea solea were collected from an industrialised area (Calais, France) and were compared with diseased and healthy L. limanda caught in a non-industrialised area (Brixham, England). Analysis of skin samples from necrosed and healthy fish by X-ray microanalysis and atomic absorption spectroscopy has shown that no elemental accumulation occurs either in necrosed fish, or fish from an industrialized area. The fish from Calais were heavily infested with the ectoparasitic copepod Lepeophtheirus pectoralis (O.F. Muller) and, although few were found on fish from Brixham, it is unlikely that this infestation was related to the discharge of industrial effluents. (Deal-EIS)

METHYLMERCURY: REPRODUCTIVE AND BEHAVIORAL EFFECTS ON THREE GENERATIONS OF MALLARD DUCKS,
Fish and Wildlife Service, Laurel, MD. Patuxent Wildlife Research Center.
G. H. Heinz.
Journal of Wildlife Management, Vol. 43, No. 2, p 394-401, 1979. 6 tab, 25 ref.

Descriptors: *Mallard duck, *Mercury, *Toxicity, *Methylmercury, *Bird eggs, *Tissue analysis, *Bioaccumulation, Heavy metals, Animal behavior, Animal physiology, Reproduction, Growth stages, Hatching, Nests, Path of pollutants.

Three generations of mallard ducks were fed either a control diet or a diet containing 0.5 ppm mercury in the form of methylmercury. The levels of mercury in adult tissues and eggs remained about the same over 3 generations. The methylmercury diet had no effect on adult weights or weight changes during the reproductive season. Females fed a diet containing 0.5 ppm mercury laid a greater percentage of their egg outside their nestboxes than did controls, and also laid fewer eggs and produced fewer ducklings. Metylmercury in the diet appeared to result in a small amount of eggshell thinning. Ducklings from parents fed methylmercury were less responsive than controls to tape-recorded maternal calls, but were hyper-responsive to a frightening stimulus in avoidance tests; there were no significant differences in locomotor activity in an open-field test. EFFECT OF HIGH CONCENTRATIONS OF PETROLEUM AND PHENOL ON THE METABOLISM OF NUCLEIC ACIDS OF ALGAE MACROPHYTES,
Institute of Biology of Southern Seas, Sevastopol (USSR). Dept. of Marine Sanitary Hydrobiology.
I. A. Divavin, O. G. Mironov, and I. M. Tsymbal.
The Soviet Journal of Marine Biology, Vol. 4, No. 1, p 542-544, 1978. 1 tab, 6 ref. (Translated from Russian).

Descriptors: *Biochemistry, *Toxicity, *Phenols, *Oil, Oil spills, *Nucleic acids, *DNA, *RNA, Chlorophyta, Rhodophyta, Phaeophyta, Marine algae, Metabolism, Chemical reactions, Chemical analysis, *Plant physiology.

The authors describe the change in content of free nucleotides RNA and DNA in green (Enteromorphia intestinalis, Bryopsis plumosa), red (Callithamnion corymbosum), and brown (Scytosiphon lomentaria) algae under the effect of petroleum and phenol taken separately and combined in concentrations of 0.5 and 0-2.0 ml/liter and g/liter, respectively. It is found that petroleum is a stronger toxin than phenol. Different reactions of different species of algae to the effect of toxicants are discovered. The authors hypothesize that the changes in free nucleotide content are due to the disruption of biosynthesis of nucleotides and nucleic acids. (Deal-EIS)

AVAILABILITIES OF THREE IRON COMPOUNDS AS DIETARY IRON SOURCES FOR RED SEA BREAM,
Kyushu Univ., Fukuoka, (Japan). Fisheries Research Lab.
S. Sakamoto, and Y. Yone.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 45, No. 2, p 231-235, 1979. 5 tab, 14 ref.

Descriptors: *Fish diets, *Iron, Fish hatchery, *Bream, *Chrysophrys, *Tissue analysis, Chlorides, Fish management, Aquiculture, Biochemistry, Amino acids, Absorption, Chemical analysis, Chelators, Acids, Enzymes.

Two experiments were conducted to compare the availability of ferrous chloride, ferric chloride, and ferric citrate as the iron sources in the diet for red sea bream, Chrysophrys major. Iron contents of the test diets were adjusted to approximately 15 mg per 100 g of diet in experiment I, and 20 mg per 100 g in experiment II. Fish were reared on the test diets at 25 degrees C over a 73-day period (Exp. I) and over a 90-day period (Exp. II). At the end of the feeding trial, hematological examinations and chemical analyses of the blood serum were conducted. At the 15 mg Fe per 100 g diet level, fish fed the diet supplemented with ferric citrate showed a slight iron deficiency anemia, but fish fed the diets with supplemental ferrous chloride and ferric chloride did not. On the other hand,

: the 20 mg Fe per 100 g diet level, no anemia was ound in the ferric citrate group. Therefore, it is oncluded that the amount of ferrous chloride and erric chloride required for the prevention of iron eficiency anemia corresponds to 15 mg Fe per 00 g diet, and that of ferric citrate corresponds to 0 mg Fe per 100 g diet. IELDRIN POLLUTION IN THE RIVER IOLME CATCHMENT, YORKSHIRE,
Ianchester Univ. (England).
. Brown, E. G. Bellinger, and J. P. Day.
nvironmental Pollution, Vol. 18, p 203-211, 1979. fig, 3 tab, 18 ref.

Descriptors: *Dieldrin, *Pesticide residues, Sewage effluents, *Textile industry, Pesticide ki-etics, Chlorinated hydrocarbon pesticides, Organ- compounds, Path of pollutants, Industrial astes, Chemical wastes, Textiles, Water chemis-y, Bottom sediments, Particle size.

Dieldrin concentrations were measured during 976 and 1977 in the River Holme and some of its ributaries, Yorkshire, England. The presence of ieldrin arises from its use as a mothproofer in the extile industry. Concentrations were measured rom both water and sediment samples from each te. The highest levels of dieldrin were found elow sewage works outfalls as the textile mills ere discharging their effluent to sewer, not direct ito the river. Stations above sewage outfalls had ower concentrations. Less than 30% of the diel-rin was associated with particles of less than 0.7 illimicrons in diameter. Concentrations of diel-rin in this river catchment were thought to be igh enough to have a biological effect and this spect was briefly discussed. (Deal-EIS)

CCUMULATION OF CADMIUM BY ARTE-IIA SALINA,
Queen Mary Coll., London (England). Dept. of oology and Comparative Physiology.
. R. Jennings, and P. S. Rainbow.
Iarine Biology, Vol. 51, p 47-53, 1979. 2 fig, 2 tab, ref.

Descriptors: *Brine shrimp, *Cadmium, *Food hains, *Bioaccumulation, Tissue analysis, Path of ollutant, Heavy metals, Animal physiology, nimal metabolism, Chemical analysis, Digestion, bsorption, Phytoplankton, Crabs, Tracers, Ra-ioactivity, Techniques, Radioisotopes,.

The relative importance of accumulation of cadmi-m by Artemia salina directly from solution and rom ingested food has been studied at 3 cadmium oncentrations (0.1, 1 and 10 ppm) under con-rolled experimental conditions. At each cadmium oncentration, A. salina were exposed to cadmium n 4 ways; in solution; in solution the presence of atex 'food' particles; in solution with cadmium-ich Dunaliella tertiolecta as a food source; and to admium-rich D. tertiolecta alone. Net accumula-ion of cadmium by A. salina continued throughout days exposure under all 4 conditions. When the rine shrimp were removed to cadmium-free con-itions, their accumulated cadmium concentrations eclined and levelled off to a stabilised plateau fter 10 days. From consideration of these stabi-sed levels it was shown that at least 30% of admium accumulation directly from solution ccurs via uptake through the alimentary tract. At ower cadmium exposures uptake from food is the ajor route for cadmium accumulation, but at igher exposures the cadmium-saturated food ource displaced cadmium-rich water from the gut nd therefore actually inhibited cadmium accumu-lation. This study, therefore, concludes that the food chain will be the major source of cadmium as long as the previous trophic level has the ability to accumulate the metal to such an extent as to make it more available to the consumer than by direct uptake from seawater. (Deal-EIS)

TOXICITY OF CADMIUM CHLORIDE AND LEAD NITRATE TO CHIRONOMUS TENTANS LARVAE,
Vikram Univ., Ujjain, (India) School of Studies in Zoology.
H. S. Rathore, P. K. Sanghvi, and H. Swarup.
Environmental Pollution, Vol. 18, p 173-177, 1979. 1 tab, 17 ref.

Descriptors: *Cadmium, *Lead, *Toxicity, *Diptera, *Tissue analysis, *Textile industry, Chlorides, Nitrates, Heavy metals, Larval growth stage, Food chains, Fish food organisms, Chemical wastes, Pulp wastes, Protein.

Chironomid larvae form an important link in aquatic food chains. Effluents from textile and pulp mills contain cadmium and lead salts which are dangerous to chironomid larvae, an important fish food. Toxicities of cadmium chloride and lead nitrate were studied under experimental conditions and the mean survival time and LD100 values were calculated. The LD100 values were 20 and 70 ppm for cadmium chloride and lead nitrate, respectively. Results suggest that following poisoning by CdCl2 the total protein contents of the chironomid larvae decrease. This may diminish the nutritive value of these larvae as fish food. Qualitative analysis of larvae following exposure to CdCl2 and Pb(NO3)2 showed that these heavy metals were taken up by the chironomids. (Deal-EIS)

The acute toxicity of methamidophos and three other compounds to fingerlings of the common carp was determined. The 96-h LC50 values were 68 mg/litre for methamidophos, 1.7 mg/litre for carbaryl, 0.21 mg/litre for lindane and 50 mg/litre for diquat. The acetylcholinesterase (AChE) and carboxylesterase (CarE) activities of the brain and liver were monitored over six weeks in fish poisoned with sublethal doses of methamidophos. Brain CarE was more sensitive than AChE, but for the liver the reverse was true. In either case the degree of enzyme inhibition increased with increasing insecticide concentrations in the water. After exposure to methamidophos at 20 mg/litre for 48 h liver AChE and CarE recovered faster than those of the brain. For both organs CarE recovered faster than AChE. At sublethal doses methamidophos affected the growth rate of the fish but no direct relationship between growth and insecticide concentrations could be established. (Deal-EIS)

CHRONIC LEAD POISONING IN A HERD OF MUTE SWANS,
MAFF Veterinary Investigation Centre, Loughborough (England).
V. R. Simpson, A. E. Hunt, and M. C. French.
Environmental Pollution, Vol. 18, p 187-202, 1979. 10 fig, 4 tab, 17 ref.

Descriptors: *Lead, *Toxicity, *Mute Swan, *Mortality, *Tissue analysis, *Bioaccumulation, *Anemia, Swans, Waterfowl, Poisons, Heavy metals, Iron, Zinc, Animal pathology, Animal physiology, Path of pollutants, Chemical analysis, Weight.

Lead poisoning due to the ingestion of lead fishing shot was shown to be the cause of death of a number of mute swans Cygnus olor. The area in which they were feeding was shown to be heavily contaminated with fishing shot. The results of clinical, histopathological, haematological and analytical examinations are reported. The kidneys of the dead birds contained from 350 to 6650 micrograms/g DM of lead and blood lead levels in the remainder of the herd were greatly elevated, rising to 3290 micrograms/100ml. Consistently elevated liver levels of iron and zinc and a marked loss of body weight were all directly proportional to the increase in kidney lead concentration. (Deal-EIS)

LETHAL AND SUBLETHAL EFFECTS OF BINARY MIXTURES OF CYANIDE AND HEXAVALENT CHROMIUM, ZINC, OR AMMONIA TO THE FATHEAD MINNOW (PIMEPHALES PROMELAS) AND RAINBOW TROUT (SALMO GAIRDNERI),
Minnesota, Univ., St. Paul. Dept. of Entomology, Fisheries, and Wildlife.
S. J. Broderius, and L. L. Smith, Jr.
Journal of the Fisheries Research Board of Canada, Vol. 36, p 164-172, 1979. 1 fig, 2 tab, 31 ref.

Descriptors: *Toxicity, *Minnows, *Rainbow trout, *Chemical properties, *Cyanide, Zinc, Chromium, Bioassay, Mortality, Ammonia, Fish physiology, Growth rates, Chemical reactions, Mathematical models, Juvenile growth stage.

Various models have been proposed to predict the combined interactive effect on fish of mixtures of poisons from separate toxicities of individual substances. The success of these models was tested, using data describing the lethal and sublethal effects of individual substances or binary mixtures of HCN and Cr(VI), Zn(II), or ammonia to the fathead minnow and rainbow trout. Using the strictly additive toxic unit and additive index approach, it was determined from log-dosage mortality curves that the Zn-HCN and ammonia-HCN mixtures were more acutely toxic and Cr-HCN less toxic than predicted. The concentration and response addition models, which have been proposed for toxicants whose joint action is similar or independent, respectively, could not be used to predict dosage-mortality curves for the HCN mixtures. Linear regression lines representing the growth response of fish to log concentration for toxicants alone and in binary combinations were not significantly different, thus, for the toxic substances tested, the sublethal joint action of individual toxicants was not predictable from existing models and, in most cases, no interaction was indicated. The interactive nature of toxicants may be a function of the concentrations tested causing different biological processes to be affected (e.g. mortality vs. growth), and therefore different responses to be measured. A need still exists for development of a valid multiple toxicity approach for evaluating and predicting the toxicity of chemical combinations. (Deal-EIS)

THE EFFECTS OF HYDROGEN CYANIDE ON ASELLUS COMMUNIS AND GAMMARUS PSEUDOLIMNAEUS AND CHANGES IN THEIR COMPETITIVE RESPONSE WHEN EXPOSED SIMULTANEOUSLY,
Minnesota Univ., St. Paul. Dept. of Entomology, Fisheries and Wildlife.
D. M. Oseid, and L. L. Smith, Jr.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 439-447, 1979. 6 tab, 8 ref.

Descriptors: *Fish physiology, *Toxicity, *Dominant organisms, *Hydrogen cyanide, *Gammarus, *Asellus, Isopods, Zooplankton, Competition, Animal behavior, Bioassay, Animal reproduction, Chemical properties, Fish eggs, Chemical wastes.

In the present study, short-term tests were done on each species alone and then full-life-cycle tests were performed on each species alone and then with the two together. The 96-h LC50 for Asellus was 2,295 microgram/l HCN and for Gammarus was 169 microgram/l. The highest no-effect concentration on Asellus in the full-life-cycle test lies between 29 and 40 microgram/l. The no-effect concentration on Gammarus was between 16 and 21 microgram/l. When exposed together to low levels, the competitive advantage shifted from Gammarus to the normally passive Asellus. (Deal-EIS)

METHYLAMINE UPTAKE IN THE GREEN ALGA CHLORELLA PYRENOIDOSA,
Rochester Univ., NY. Dept. of Biology.
J. L. Pelley, and T. T. Bannister.
Journal of Phycology, Vol. 15, p 110-112, 1979. 1 fig, 11 ref.

Descriptors: *Absorption, *Chlorella, *Nitrogen, *Methylamine, *Penicillium, Ammonium compounds, Kinetics, Chemical properties, Chemical analysis, Enzymes, Biochemistry, Cytological studies, Nitrogen compounds.

Methylamine uptake in nitrogen-starved Chlorella pyrenoidosa follows Michaelis-Menten kinetics: maximum uptake is about 1.6 nmol/microl cells/min half-saturation occurs at 4 microM methylamine, and the slope in the range where uptake is proportional to concentration is 0.4 nmol microl/min/microM. In cells grown in the presence of a non-limiting nitrogen concentration, methylamine uptake is directly proportional to concentration up to at least 0.5 mM, and the slope is 1/500 that for starved cells. Similar uptake kinetics have been reported for Penicillium chrysogenum and attributed to an inducible 'ammonium permease'. Apparently, a similar permease occurs in algae. (Deal-EIS)

REQUIREMENT OF RED SEA BREAM FOR DIETARY MG,
Kyushu Univ., Fukuoka (Japan). Fisheries Research Lab.
S. Sakamoto, and Y. Yone.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 45, No. 1, p 57-60, 1979. 1 fig, 5 tab, 16 ref.

Descriptors: *Magnesium, *Fish diets, *Bream, *Chrysophrys, *Tissue analysis, Aquiculture, Chemical analysis, Fish management, Growth rates, Calcium, Phosphorus, Fish diseases, Fish physiology.

Red sea bream, Chrysophrys major, were fed diets with and without supplemental magnesium (66 and 12 mg Mg per 100 g diet, respectively) over a 60-day period. No significant differences were recognized between the two groups in the following determinations: the growth rate, feed efficiency, condition factor, and hepatosomatic index; the hemoglobin content, hematocrit value, red blood cell count, mean corpuscular hemoglobin, mean corpuscular volume, mean corpuscular hemoglobin concentration, mean corpuscular diameter, percentage of immature erythrocytes, a number of lymphocytes and granulocytes per 1000 red blood cells, and content of magnesium in the whole blood; the blood serum levels of calcium inorganic phosphorus, and urea-N; the moisture, lipid, and glycogen content of the dorsal muscle and liver; and the ash, calcium, phosphorus, and magnesium content of the vertebrae. Furthermore, no pathological change was recognized in the organs, erythrocytes, and leucocytes of fish fed the diet without the magnesium supplement. From these findings, it appears that magnesium supplementation in the diet for red sea bream is not essential, when the magnesium exists at a level exceeding 12 mg per 100 g diet. (Deal-EIS)

Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 453-457, 1979. 1 fig, 10 ref.

Descriptors: *Cadmium, *Lethal limit, *Daphnia, Toxicity, Mortality, Heavy metals, Aquatic populations, Zooplankton, Mathematical studies, Lake Michigan, Animal physiology, Water pollution effects, Laboratory tests, On-site-investigations, Methodology.

The purpose of this paper is to report on the relationship between exposure time and cadmium toxicity to laboratory and field populations of Daphnia galeata mendotae, as summarized in a cadmium toxicity curve, and to derive a cadmium toxicity curve, and to derive a cadmium application factor. The 96-h EC50 is 30 microg Cd/L and the 48-h EC50 is 40 microg Cd/L. The long-term effects of increased cadmium concentrations on relative carrying capacity for D. galeata mendotae populations, K, is represented by the equation K = 1.0-0.065 Cd, and the corresponding chronic ECl is 0.15 microg Cd/L. STUDIES ON INTRAPERITONEAL TOXICITY OF LEAD TO CICHLASOMA NIGROFASCIATUM (GUENTHER) DEVELOPMENT,
Uppsala Univ. (Sweden). Inst. of Zoology.
P. T. E. Ozoh.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 676-682, 1979. 2 tab, 27 ref.

Descriptors: *Lead, *Toxicity, *Cichlids, Metals, *Mutagens, *Teratogens, Fish reproduction, Fry, Larval growth stage, Mortality, Fish physiology, Spawning, Fertility, Heavy metals, Embryonic growth stage, Water pollution effects.

Zebra cichlids were exposed to several concentrations of lead (50-600ppm) via intraperitoneal injections. Lead affected ovulation and its frequency. All the doses were more toxic to females, which experienced ovulation stresses, loss of muscular coordination and balance, irregular swimming bouts, swollen stomachs and finally falling to the bottom followed by death. In the Zebra cichlids that out-lived lead toxicity, spermatogenesis and oorgenesis occurred up to 300 ppm. Lead affected the survival of the fry. Lead also induced a number of lethal and non-lethal congenital malformations in the fry. (Deal-EIS)

CHEMICAL CONTAMINATION BY PCBS IN THE FISHES OF A FRENCH RIVER: THE FURANS (JURA),
Ecole Nationale Veterinarie de Lyon (France). Lab. of Toxicology.
G. Keck, and J. Raffenot.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 689-696, 1979. 5 fig, 1 tab, 8 ref.

Descriptors: *Polychlorinated biphenyls, *Brown trout, *Bullheads, *Pesticide residues, *Tissue analysis, *Bioaccumulation, *Furans River(France), *Cyprinids, PCB, Salmonids, Chlorinated hydrocarbon pesticides, Pesticide kinetics, Path of pollutants, DDT, Size, Weight, Lipids, Chemical analysis, Water pollution effects.

Representative species of the fish population of the Furans River were analyzed for PCB content. The levels of PCBs found in the fishes were relatively high, much higher than the levels of organochlorine pesticides. The most striking fact is the high degree of accumulation by the barbel and the cub (Cyprinids) in comparison with the Salmonids, trout and grayling. The distribution of PCBs between the organs varies according to the species; the liver always concentrates most; the gills and the eggs also contain high concentrations; the levels in the kidney and the muscle vary with the species. TOXICITY AND BIOACCUMULATION OF HEXACHLOROCYLOPENTADIENE HEXACHLORONORBORNADIENE AND HEPTACHLORONORBORNENE IN LARVAL AND EARLY JUVENILE FATHEAD MINNOWS, PIMEPHALES PROMELAS,
Environmental Research Lab., Duluth, MN.
R. L. Spehar, G. D. Veith, D. L. DeFoe, and B. V. Bergstedt.
Bulletin of Environmental Contamination and Toxicolog,, Vol. 21, p 576-583, 1979. 3 tab, 21 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Toxicity, *Minnows, *Tissue analysis, *Bioaccumulation, *Cyclodiene insecticides, Hexachlorocyclopentadiene, Pesticide toxicity, Pesticide kinetics, Chemical analysis, Chemical reactions, Chemical properties, Insecticides, Bioassay, Mortality, Fish physiology, Larval growth stage, Juvenile growth stage.

The purpose of this study was to determine the toxicity and bioaccumulation of hexachlorocyclopentadiene and selected derivatives using 30 day flow through tests with larval and early juvenile stages of the fathead minnow. Thirty-day exposures with larval and early juvenile fathead minnows showed that concentrations of 7.3, 38.4, and 40.0 micrograms/L and above of hexachlorocyclopentadiene, hexachloronorbornadiene, and

heptachloronorbornene, respectively, would be deleterious to this species. The 96-h LC50 and 30-day LC50 values for these compounds, respectively, were: 7.0 and 6.7 micrograms/L, 188 and 123 micrograms/L, and 85.6 and 60.1 micrograms/L. Bioconcentration factors were uniformly low for hexachlorocyclopentadiene but were proportional to exposure concentration for hexachloronbornadiene and heptachloronorbornene. (Deal-EIS)

REMOBILIZATION OF SEDIMENT-ASSOCIATED PCBS BY THE WORM NEREIS DIVERSICOLOR,
International Lab. of Marine Radioactivity, Monte Carlo (Monaco). Oceanographic Museum.
D. L. Elder, S. W. Fowler, and G. G. Polikarpov.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 448-452, 1979. 1 fig, 10 ref.

Descriptors: *Polychlorinated biphenyls, *Worms, *Absorption, *Bottom sediments, *Nereis, *Depuration, *Bioconcentration, *Tissue analysis, Marine benthos, Sediments, Chlorinated hydrocarbon pesticides, Path of pollutants, Chemical analysis, Organic compounds, Animal metabolism.

In order to test the existence and degree of importance of remobilization of PCBs from sediments, the polychaete Nereis diversicolor was exposed to sediment containing 0.65 ppm PCB. The worms absorbed PCBs until equilibrium was reached in 40-60 days. The concentration factors was approximately 3.5. Following transfer to uncontaminated sediments the PCB content of the worms steadily decreased. It was theorized that the depuration rate was dependent on the PCB level in the sediments. (Deal-EIS)

THE CHRONIC TOXICITY OF CARBARYL AND LINDANE TO THE FRESHWATER MOLUSC LYMNEA STAGNALIS L. (TOXICITE CHRONIQUE DU CARBARYL ET DU LINDANE CHEZ LE MOLLUSQUE D'EAU LYMNEA STAGNALIS L),
Paris-11 Univ., Orsay (France). Lab. de Zoologie.
J. Seuge, and R. Bluzat.
Water Research, Vol. 13, p 285-293, 1979. 4 fig, 5 tab, 20 ref. (English Abstract).

Descriptors: *Toxicity, *Insecticides, *Mollusks, *Lindane, Carbaryl, *Lymnea, *Embryogenesis, Freshwater snails, Growth rates, Larval growth state, Animal physiology, Animal metabolism, Fecundity, Fertility, Pesticide toxicity, Carbamate pesticides, Chlorinated hydrocarbon pesticides.

The chronic toxicity of the two insecticides to snails was studied from the hatching of the eggs. In the case of lindane, the rearing of larvae is impossible beyond a 2 mg/l concentration. With these two toxic products (1 or 2 mg/l) the shell growth is reduced in proportion to the doses. The shell calcification is clearly disturbed only by lindane. This product (1 mg/l) produces a decrease of the fecundity more evident than carbaryl (2 mg/l). The fertility of the eggs is reduced when they are laid and incubated in these toxic solutions from the 2 mg/l concentration. The embryogenesis is disturbed by lindane. An early intoxication by these two insecticides, compared with a late one, affects the biological parameters more severely. (Deal-EIS)

BIOCONCENTRATION OF CHLORDANE BY THE GREEN ALGA SCENEDESMUS QUADRICAUDA,
Toronto Univ. (Ontario). Faculty of Forestry.
V. Glooschenko, M. Holdrinet, J. N. A. Lott, and R. Frank.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 515-520, 1979. 1 tab, 20 ref.

Descriptors: *Scenedesmus, *Chlorinated hydrocarbon pesticides, *Chlordane, *Bioconcentration, Chlorophyta, Pesticide kinetics, Path of pollutants, Metabolism, Phytoplankton, Organic compounds, Chemical analysis, Aquatic algae, Biodegradation.

Results show a bioconcentration factor of 6,000 to 15,000 for cis and trans chlordane at all treatment levels after 24 hr. This is in contrast to a bioconcentration factor of 98,000 observed in the unbranched filamentous algal Oedogonium. The greater algal biomass represented by Oedogonium may have contributed to increased pesticide uptake. Our work shows the major isomers of technical chlordane are concentrated by Scenedesmus from initial environmental levels as low as 0.1 micrograms/L. The 0.1 micrograms/L level is approximately 1/100 of the water solubility of technical chlordane. The data indicate that bioconcentration was rapid, occurring within the first 24 hr. (Deal-EIS)

ORGANOPHOSPHATE POISONING TO SOME FRESH WATER TELEOSTS - ACETYLCHOLINESTERASE INHIBITION,
D.A.V. Coll., Muzaffarnagar (India). Pollution Relevant Research Lab.
S. R. Verma, A. K. Tyagi, M. C. Bhatnagar, and R. C. Dalela.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 502-506, 1979. 2 tab, 14 ref.

Descriptors: *Organophosphorus pesticides, *Pesticide toxicity, *Enzymes, *Acetylcholinesterase, *Tissue analysis, *Channa, *Cirrhina, *Malathion, Biochemistry, Chemical analysis, Insecticides, Freshwater fish, Fish physiology, Animal metabolism, Mortality, Inhibition, Water pollution effects.

The activity of AChE in the brain, liver and muscles of Channa gachua and Cirrhina mrigala was determined after exposure of fishes to sublethal concentrations of Zolone, Rogor and Malathion. A significant fall in the AChE activity has been observed after treatment in both the fishes. A progressive significant fall in the enzyme activity has been observed in all tissues with increased pesticide concentrations. The highest fall in the activity of this enzyme was observed in brain of C. mrigala after three days exposure to Malathion, while least in liver of C. gachua exposed for seven days in Rogor. EFFECT OF INTERMITTENT CHLORINATION ON DEVELOPING ZEBRAFISH EMBRYOS (BRACHYDANIO RERIO),
Florida Inst. of Tech., Melbourne. Dept. of Biological Sciences.
S. F. Yosha, and G. M. Cohen.
Bulletin of Environmental Contamination and Toxicology, Vol. 121, p 703-710, 1979. 3 fig, 3 tab, 24 ref.

Descriptors: *Chlorine, *Toxicity, *Embryonic growth stage, *Chlorination, *Zebrafish, Larval growth stage, Mortality, Ions, Calcium, Magnesium, Chlorides, Fish eggs, Fish physiology, Water quality, Water pollution effects.

The primary objective was to determine whether chlorine adversely affects the hatchability of freshwater fish embryos and to what extent, if any, chlorine toxicity is modified by the ionic composition of the water. Contrary to initial expectations, chlorine, even at a relatively high concentration (1 mg/mL total residual chlorine), was not toxic to developing zebrafish embryos prior to hatching. However, chlorine in the presence of a mild external ionic stress (CaCl2 and MgCl2) significantly reduced the number of embryos hatched. Chlorine was toxic to newly hatched larvae in all solutions tested, whereas no mortalities of the newly hatched larvae occurred in any of the solutions in the absence of chlorine. Once again ionic stress potentiated the effects of chlorine. (Deal-EIS)

VESSEL-RELATED CONTAMINATION OF SOUTHERN CALIFORNIA HARBOURS BY COPPER AND OTHER METALS,
Southern California Coastal Water Research Project El Segundo.
D. R. Young, G. V. Alexander, and D. McDermott-Ehrlich.
Marine Pollution Bulletin, Vol. 10, p 50-56, 1979. 3 fig, 5 tab, 19 ref.

Descriptors: *Mussels, *Copper, *Paints, *Antifouling materials, *Tissue analysis, *Mytilus, Chemical analysis, Polychlorinated biphenyls, Silver, Cadmium, Chromium, Nickel, Lead, Tin, Zinc, Ships, Water pollution sources, Bioindicator.

A number of trace contaminants appear to be introduced to nearshore marine waters as a result of vessel-related activities. Such inputs are clearly reflected by elevated concentrations of these constituents in several tissues of the bay mussel Mytilus edulis. Comparative studies using this bioindicator suggest that harbour-related activities can be as important a source as coastal wastewater discharges in the contamination of nearshore marine ecosystems. TEMPERATURE SELECTION AND ESTIMATED THERMAL ACCLIMATION BY RAINBOW TROUT (SALMO GAIRDNERI) IN A THERMAL PLUME,
Argonne National Lab., IL.
S. A. Spigarelli, and M. M. Thommes.
Journal of the Fisheries Research Board of Canada, Vol. 36, p 366-376, 1979. 5 fig, 3 tab, 38 ref.

Descriptors: *Rainbow trout, *Thermal pollution, *Water temperature, Heated water, Fish physiology, Animal metabolism, Adaptation, Size, Weight, Fish behavior, Lake Michigan, Nuclear powerplants, Cooling water, Water pollution effects.

Body temperatures of rainbow trout caught from a thermal discharge into Lake Michigan were used to determine selected temperatures and to estimate acclimation temperatures of this species under field conditions. Approximately 65-75% of the variability in body temperatures was related to water temperature (direct) and fish weight (inverse). Body temperatures increased with increases in discharge temperature, but the difference between body and ambient water temperatures decreased at high water temperatures. The modal body temperature of small fish was 19 degrees C, the final preferred temperature predicted for rainbow trout by some lab studies. The modal body temperature of large fish was 15 degrees C. Estimates of acclimation temperatures indicate that the majority of rainbow trout caught in this discharge area were acclimated to plume temperatures. Estimated acclimation temperatures exceeded ambient acclimation by as much as 10 degrees C for individual fish while group means ranged between 2 and 6 degrees C for individual fish while group means ranged from 2 and 6 degrees C over acclimation. PCBS AND ORGANOCHLORINE INSECTICIDES IN OYSTERS FROM COASTAL LAGOONS OF THE GULF OF MEXICO, MEXICO,
Universidad Nacional Autonoma de Mexico, Mexico City. Centro de Ciencias del Mar y Limnologia.
M. T. Rosales, L. A. V. Botello, H. Bravo, and E. F. Mandell.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 652-656, 1979. 1 fig, 2 tab, 6 ref.

Descriptors: *DDT, *Polychlorinated biphenyls, *Oysters, *Pesticide residues, *Tissue analysis, *Crassostrea, *Chlordane, *Endosulfan, *Bioaccumulation, Dieldrin, Chlorinated hydrocarbon pesticides, Endrin, Gulf of Mexico, Lagoons, Coastal waters, Path of pollutants, Pesticide kinetics.

The purpose of this study was to determine baseline levels of PCBs and organochlorine insecticides in oysters (Crassostrea virginica) from coastal lagoons of the Gulf of Mexico. PCBs were found in all samples analyzed, indicating that these compounds are widely distributed. The concentration of PCBs ranged from 14 to 90 ppb, with the lowest

values from very sparcely populated areas. DDT and dieldrin were present in most of the oysters analyzed, other organochlorine compounds were infrequently detected or found at low levels. DDT, with its analogs, occurred in concentrations ranging from 6 to 28 ppb. Dieldrin concentrations ranged from 0.03 to 1.1 ppb. (Deal-EIS)

EFFECT OF PH ON TOXICITY OF KRAFT PULP AND PAPER MILL EFFLUENT TO SALMONID FISH IN FRESH AND SEAWATER,
British Columbia Research Council, Vancouver. Div. of Applied. Biology.
D. J. McLeay, C. C. Walden, and J. R. Munro.
Water Research, Vol. 13, p 249-254, 1979. 2 fig, 2 tab, 29 ref.

Descriptors: *Pulp wastes, *Hydrogen ion concentration, *Toxicity, *Acclimation, Bioassays, Rainbow trout, Coho salmon, Chemical wastes, Industrial wastes, Fish physiology, Mortality, Bleaching wastes, Juvenile growth stage, Salmonids, Water pollution effects.

In freshwater bioassays with juvenile rainbow trout at initial pH values from 4 to 11, kraft mill effluents were considerably less toxic at pH 9-10 than at neutrality. When pH of test solutions was controlled throughout the bioassay period, the least toxic range was 8.5-9.5. Toxicity at typical receiving-water pH values was 50-67% greater. The acute toxicity of effluent samples to yearling coho salmon was identical for these effluents in seawater and freshwater respectively, provided that the pH was adjusted and held at the same value, and that test fish were previously acclimated to the dilution water for several months. Thus seawater constituents other than pH did not affect the acute toxicity of pulp and paper mill effluents appreciably. (Deal-EIS)

EFFECT OF UPGRADING A MUNICIPAL WASTEWATER EFFLUENT ON POLLUTION INDICATOR AND OTHER MICROORGANISMS IN RIVER WATER,
Connecticut Univ., Noank. Marine Research Lab.
E. A. Matson, S. G. Hornor, and J. D. Buck.
Environmental Science and Technology, Vol. 13, No. 4, p 460-465, 1979. 5 fig, 6 tab, 48 ref.

Descriptors: *Coliforms, *Enteric bacteria, *Sewage bacteria, *Sewage treatment, Chlorination, Bacteria, Water quality, Water quality control, Primary treatment, Secondary treatment, Municipal wastes, Activated sludge, Waste treatment, Streptococcus, Yeasts, Biochemical oxygen demand.

Densities of total and fecal coliforms, fecal streptococci, plate count bacteria, and certain yeasts were monitored in an eastern Connecticut watershed for 1 year prior to upgrading a municipal primary settling treatment plant to activated sludge. Sampling was continued for 19 months afterward. Substantial reductions in densities of indicator and other bacteria and yeast upstream of the effluent after upgrading were associated with lower annual precipitation and reduced precipitation-associated sampling. The effluent dilution decreased from 0.84 to 1.42% of river volume due to increased daily treatment plant discharge and decreased river discharge. Calculated reductions in effluent discharge of indicators ranged from 10% (total coliforms) to 84% (fecal coliforms), while the discharge of 'total plate count bacteria' increased 500%. Chlorination procedures were still required to reduce river total coliform densities below the accepted limit. Within the microbiological perspective, upgrading this treatment plant was of limited value to potential water users. (Deal-EIS)
W79-07633

EFFECTS OF VARIOUS TEMPERATURE CYCLES ON THE LARVAL DEVELOPMENT OF THE GASTROPOD MOLLUSC CREPIDULA FORNICATA,
Duke Univ., Beaufort, NC. Marine Lab.
J. S. Lucas, and J. D. Costlow, Jr.
Marine Biology, Vol. 51, p 111-117, 1979. 3 fig, 3 tab, 12 ref.

Descriptors: *Water temperature, *Gastropods, *Thermoperiodism, *Tissue analysis, Inhibition, Growth rates, Larval growth stage, Mollusks, Cycles, Period of growth, Biorhythms, Animal physiology, Animal metabolism, Thermal pollution.

Veligers of Crepidula fornicata (L.) were reared for 12 days at constant temperatures of 15, 20, 25, 30 and 35 degrees C, and at 5 degrees C daily cycles of equal periodicity (COEP) over the temperature ranges 15 to 20 degrees C, 20 to 25 degrees C, 25 to 30 degrees C and 30 to 35 degrees C. COEP consisted of equal periods (6 h) of maximum temperature, minimum temperature, and uniformly increasing and decreasing temperature each 24 h period. Survival was high and not influenced by cyclic or constant temperature from 15 to 30 degrees C. At 35 degrees C and COEP 30 to 35 degrees C, all larvae died before day 6. Shell growth rate increased markedly over the range 15 to 25 degrees C, and growth rates at cyclic temperatures in this range were intermediate between growth rates at the corresponding constant temperatures. Larvae reared at COEP 15 to 20 degrees C and COEP 30 to 35 degrees C had discontinuities in their shells due to inhibition of shell secretion during the adverse part of each temperature cycle. Groups of C. fornicata veligers were exposed for 2 days to daily temperature cycles of equal and unequal periodicity in their critical 30 to 35 degrees C range. These veligers showed shell growth although their body tissue declined, as indicated by decreasing carbon content per larva. Least shell growth and most body tissue loss occurred in those cycles with the longest exposure to higher temperature. Rates of shell growth of veligers in temperature cycles show an immediate effect of environmental temperature, while changes in carbon content per larva better reflect the effects of temperature on general metabolism and survival. (Deal-EIS)
W79-07634

INTERACTIVE EFFECTS OF SALINITY, TEMPERATURE AND CHRONIC EXPOSURE TO OIL ON THE SURVIVAL AND DEVELOPMENTAL RATE OF EMBRYOS OF THE ESTUARINE KILLIFISH FUNDULUS HETEROCLITUS,
Texas A and M Univ., College Station. Dept. of Biology.
O. Linden, J. R. Sharp, R. Laughlin, Jr., and J. M. Neff.
Marine Biology, Vol. 51, p 101-109, 1979. 4 fig, 3 tab, 33 ref.

Descriptors: *Killifishes, *Toxicity, *Oil, *Salinity, *Water temperature, *Naphthalenes, *Water soluble fraction, Embryonic growth stage, Growth stages, Growth rates, Oil pollution, Mortality, Organic compounds, Aromatic compounds, Thermal stress, Salt tolerance.

The combined effect of salinity, temperature and chronic exposure to water-soluble fractions (WSF) of a No. 2 fuel oil on the survival and development rate of embryos of Fundulus heteroclitus are described. The embryos were exposed at 3 salinities (10, 20, 30% S) and 3 temperatures (20, 25, 30 degrees C) to 3 different oil concentrations (15, 20, 25% WSF, equivalent to approx 0.28, 0.38 and 0.47 ppm total naphthalens) and to one control without oil. The results were analyzed by response-surface methodology. The lowest oil concentration was only mildly toxic to embryos under optimal salinity/temperature conditions, while the highest was extremely toxic in all factor combinations. Under optimal conditions, only the highest oil concentration resulted in more than 50% mortality. Under sub-optimal conditions, especially high and low temperatures, all 3 oil concentrations caused greater than 50% mortality. The interactive effect of salinity and temperature on survival was greatest at the lowest oil concentration. Temperature had a marked effect and salinity only a slight effect on the developmental rate of the embryos. Exposure to the low oil concentration tended to increase the temperature sensitivity of developmental duration slightly. Generally, exposure to oil decreased the time interval between fertilization and hatching. (Deal-EIS)

ENVIRONMENTAL DISTURBANCE AND LIFE HISTORIES: PRINCIPLES AND EXAMPLES,
Saskatchewan Univ., Saskatoon. Dept. of Biology.
D. M. Lehmkuhl.
Journal of the Fisheries Research Board of Canada, Vol. 36, p 329-334, 1979. 2 tab, 45 ref.

Descriptors: *Environment, *Environmental effects, *Water pollution effects, *Freshwater organisms, Aquatic organisms, Benthos, Heavy metals, Nutrients, Hydrogen ion concentration, Dissolved solids, Toxicity, Water temperature, Food chain, Heavy metals, Herbicides, Pesticides, Aquatic insects, Watershed.

While many environmental disturbances have no readily detectable effect on aquatic invertebrates in the short term, they may prevent normal reproduction and cause eventual local extinction of a species. Small temperature changes may interfere with diapause signals and prevent completion of the life cycle. Heavy metals and toxic substances may drastically reduce reproduction rates in species exposed to sublethal levels. Dissolved salts and pH affect organisms at abnormally high or low levels but most mechanisms are unknown. It is concluded that relatively little information is available on the effects of environmental disturbances on life cycles. Available information, however, is sufficient to provide evidence of many problems that require attention. (Katz-EIS)

EFFECTS OF TEMPERATURE ON THE MEDIAN TOLERANCE LIMIT OF PINK SALMON AND SHRIMP EXPOSED TO TOLUENE, NAPHTHALENE, AND COOK INLET CRUDE OIL,
National Marine Fisheries Service, Auke Bay, AK. Auke Bay Lab.
S. Korn, D. A. Moles, and S. D. Rice.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 521-525, 1979. 2 tab, 8 ref.

Descriptors: *Water temperature, *Oil spills, *Toxicity, *Pink salmon, *Shrimp, *Crude oil, *Naphthalenes, *Toluene, Oil, Oil pollution, Organic compounds, Aromatic compounds, Lethal limit, Mortality, Fish physiology, Animal physiology, Bioassay, Animal metabolism, Water pollution effects.

The concentration of toxicants in the test containers declined with time, from either evaporation losses or biodegradation, with more rapid losses occurring at higher temperatures. The 96-h TLm of pink salmon fry exposed to toluene was significantly lower at 4 degrees (6.41 ppm) than at 12 degrees C (8.09 ppm). The trend toward lower TLm's at lower temperatures was observed for the Cook Inlet crude oil WSF, but the differences were not statistically significant. The 96-h TLm' for shrimp exposed to toluene and naphthalene solutions were significantly higher at 4 degrees C (toluene = 21.4 ppm, naphthalene = 2.16 ppm) than at 12 degrees (toluene = 14.7 ppm, naphthalene = 0.97 ppm). Temperature did not affect the TLm of shrimp to the Cook Inlet crude oil WSF. (Deal-EIS)

RESIDUAL HEAVY METAL REMOVAL BY AN ALGAE-INTERMITTENT SAND FILTRATION SYSTEM,
Utah Water Research Lab., Logan.
D. S. Filip, T. Peters, V. D. Adams, and E. J. Middlebrooks.
Water Research, Vol. 13, p 305-313, 1979. 7 fig, 4 tab, 17 ref.

Descriptors: *Heavy metals, *Algae, *Waste water treatment, *Filtration, *Bioaccumulation, *Tissue analysis, *Oscillatoria, Chromium, Cadmium, Copper, Toxicity, Absorption, Biological treat-

nent, Phytoplankton, Chemical wastes, Growth rates, Scenedesmus, Chlorella.

A laboratory scale study was undertaken to determine the feasibility of using algae growing in wastewater lagoons to absorb residual heavy metals for subsequent complete removal by intermittent sand filtration of the metal laden algae. In semi-continuous cultures the mixed algal flora native to wastewater lagoons absorbed 70-90% of the cadmium and copper from the wastewater media. Chromium absorption was less by ratio (20% was absorbed), but the mass of chromium removed was much greater as high levels of chromium were added. Only one alga (Oscillatoria sp.) which was extremely resistant to chromium grew in the chromium exposed cultures. Nearly total removal of the cadmium and copper was achieved by the algae-intermittent sand filter system. The net chromium removal agreed with the accumulation analyses. The technical feasibility of removing certain heavy metals from wastewater with such a system was established. However, in depth laboratory and field studies must be conducted to maximize system efficiency, demonstrate tactical limitations, and establish design specifications. (Deal-EIS)

THE EFFECT OF TEMPERATURE ON THE TOXICITY OF CHLORINATED COOLING WATERS TO MARINE ANIMALS-A PRELIMINARY REVIEW,
Woods Hole Oceanographic Institution, MA.
J. M. Capuzzo.
Marine Pollution Bulletin, Vol. 10, p 45-47, 1979. 1 tab, 14 ref.

Descriptors: *Water temperature, *Toxicity, *Chlorine, *Chloramine, *Acartia, *Brachionus, *Homarus, Cooling water, Animal physiology, Halogens, Absorption, Thermal pollution, Thermal stress, Bioassay, Mortality, Oysters, Chlorination, Killifishes, Lobsters, Pink salmon, Chinook salmon, Powerplants.

The effect of temperature on the toxicity of free chlorine and chloramine to several species of marine animals is reviewed. For all species tested, except the copepod Acartia tonsa, temperature has a synergistic effect on the toxicity of both halogen forms. It is suggested that the effect of temperature in enhancing the toxic effects of chlorinated cooling waters to marine animals is due to an interaction of uptake rates and regulation of physiological rates and the greatest enhancement in sensitivity could be expected at the upper limit of a species' thermal tolerance. (Deal-EIS)

ACUTE TOXICITY OF PLATINUM TO COHO SALMON (ONCORHYNCHUS KISUTCH),
Normandeau Associates, Bedford, NH.
P. F. Ferreira, Jr., and R. E. Wolke.
Marine Pollution Bulletin, Vol. 10, p 79-83, 1979. 4 fig, 1 tab, 17 ref.

Descriptors: *Toxicity, *Bioassay, *Sockeye salmon, *Platinum, *Survival, *Tissue analysis, Mortality, Fish behavior, Fry, Fish physiology, Animal metabolism, Growth rates, Animal pathology, Metals.

The effects of short-term exposure to tetravalent platinum on survival, opercular movement and post-treatment growth of coho salmon fry was investigated. Employing a static water acute toxicity bioassay with platinum as (PtCl42HCl.6H2), at 8.5 + or - 0.2 degrees C, and a water hardness of 55.9 + or - 3.5 mg/l. (as CaCo3), the 24, 48, and 96-h LC50 values were 15.5, 15.2, and 2.5 mg Pt4+/l respectively. Rates of opercular movement for fish exposed to platinum increased with increasing concentrations to a level of 1.0 mg/l. No further significant increases were evident above this level. Hypoactivity of fish exposed to 0.3 mg/l and higher was evident during the acute toxicity bioassay and much of the post-treatment study. Post-treatment rate of growth for fish exposed to sublethal concentration of platinum for 96 h was less than that of the controls. (Deal-EIS)

MODIFICATION OF THE RHEOTROPIC RESPONSE OF RAINBOW TROUT (SALMO GAIRDNERI) BY SUBLETHAL DOSES OF THE AQUATIC HERBICIDES DIQUAT AND SIMAZINE,
Waterloo Univ. (Ontario). Dept. of Biology.
J. J. Dodson, and C. I. Mayfield.
Environmental Pollution, Vol. 18, p 147-157, 1979. 1 fig, 9 tab, 17 ref.

Descriptors: *Rainbow trout, *Pesticide toxicity, *Fish behavior, *Rheotropism, *Tissue analysis, *Bioaccumulation, *Simazine, Herbicides, Diquat, Absorption, Bioassay, Fish physiology, Currents(Water), Chemical analysis, Pesticide residues, Pesticide kinetics, Path of pollutants.

The rheotaxis and swimming speeds of rainbow trout in response to a water current simulated by moving a striped background past the fish were observed following 24-h exposures to field application concentrations of the herbicides diquat, simazine and their commercial formulations. Fish tissues were subsequently analysed to assess the extent of uptake of the herbicides. Toxicological modification of rheotaxis and swimming speeds was observed in fish exposed to diquat and its formulation Reglone AR resulting in an increased incidence of downstream drift. Simazine residues in fish increased in proportion to treatment levels whereas diquat residues in fish levelled off with increasing treatment levels. The toxicological modification of rheotropism is presented as a sensitive bioassay to assess sublethal effects of biocides. (Deal-EIS)

UPTAKE AND LOSS OF ZINC AND LEAD BY MUSSELS (MYTILUS EDULIS) AND RELATIONSHIPS WITH BODY WEIGHT AND REPRODUCTIVE CYCLE,
Australian Atomic Energy Commission Research Establishment, Lucas Heights. Environmental Biology Section.
R. D. Simpson.
Marine Pollution Bulletin, Vol. 10, p 74-78, 1979. 4 fig, 3 tab, 21 ref.

Descriptors: *Zinc, *Lead, *Mussels, *Absorption, *Tissue analysis, *Bioaccumulation, *Mytilus, Chemical analysis, Animal physiology, Size, Animal metabolism, Heavy metals, Biorhythms, Reproduction, Growth stages, Cycles, England.

The uptake and loss of zinc and lead from the whole soft parts of the mussel Mytilus edulis were investigated under natural conditions in north-east England. Mussels in which high concentrations of these metals were found were transferred to an area where low concentrations were found, and vice versa. Mussels from both areas were also kept in tanks and periodic measurements of metal contents were made. Indications of uptake and loss were greatly affected by changing body weights and the work suggests that phase of reproductive cycle (for animals in the environment) and condition (for animals in tanks) have to be closely considered when reporting on levels of metals in mussels, especially in terms of concentration. (Deal-EIS)

SOME EFFECTS OF SUB-LETHAL CONCENTRATIONS OF COPPER ON A MARINE COPEPOD,
Athens Univ. (Greece). Zoological Lab. and Museum.
M. Moraitou-Apostolopoulou, and G. Verriopoulos.
Marine Pollution Bulletin, Vol. 10, p 88-92, 1979. 3 fig, 1 tab, 31 ref.

Descriptors: *Copper, *Toxicity, *Copepods, *Acartia, Animal behavior, Animal physiology, Animal metabolism, Fecundity, Food habits, Feeding rates, Respiration, Oxygen requirements, Adaptation, Plankton, Heavy metals, Mortality.

Laboratory experiments were carried out to determine the influence of different concentrations of copper in feeding and respiratory rates, fecundity and longevity of the marine planktonic copepod Acartia clausi, taken from a polluted and a clean area of the Saronic gulf (Greece). In the range of copper concentrations 0.001 to 0.01 mg 1.-1, all tested activities of the animals coming from the clean region seemed affected. Feeding activity, longevity and fecundity showed a progressive reduction from 0.001 to 0.001 to 0.01 mg 1.-1. The pollution-adapted population of Acartia seemed more resistant to sub-lethal copper stress. Longevity and respiration were affected in all concentrations used. The fecundity of the pollution-adapted population was higher than that of the clean area, showing a slight increase at 0.001 and 0.0025 mg 1.-1 dropping to the control animals fecundity level at 0.01 mg 1.-1. STRONTIUM, CALCIUM AND MAGNESIUM CONTENTS OF SOME MARINE ALGAE FROM THE WEST COAST OF INDIA,
Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.
S. S. Gogate, S. M. Shah, and C. K. Unni.
Journal of the Marine Biological Association of India, Vol. 17, No. 1, p 28-33, 1975. 3 tab, 20 ref.

Descriptors: *Absorption, *Marine algae, *Strontium, *Calcium, *Magnesium, *Bioaccumulation, *Tissue analysis, *India, Phaeophyta, Chlorophyta, Rhodophyta, Chemical analysis, Radioisotopes, Metabolism.

As part of programme of work on marine radioactivity in the aquatic environment a few samples of algae were collected from the west coast of India and analysed for strontium, calcium and magnesium contents. Strontium to calcium atom ratio in brown algae was found to vary from .0216 to .0295 while in green and red algae it varied from .0051 to .0091 and .0049 to .0056 respectively. Brown algae accumulated strontium in preference to calcium from sea water. All species were shown to concentrate strontium, calcium and magnesium to some extent. (Deal-EIS)

THE EFFECT OF TEMPERATURE ON GROWTH, PHYSIOLOGY, AND GAMETOGENESIS IN THE MANILA CLAM TAPES PHILIPPINARUM (ADAMS & REEVE, 1850),
Woods Hole Oceanographic Institution, MA.
R. Mann.

Journal of Experimental Marine Biology and Ecology, Vol. 38, p 121-133, 1979. 1 fig, 4 tab, 22 ref.

Descriptors: *Clams, *Water temperature, *Tissue analysis, *Histology, *Gametogenesis, Ammonia, Animal metabolism, Animal physiology, Biochemistry, Reproduction, Growth rates, Carbohydrates, Mollusks, Water pollution effects.

Populations of the Manila clam were maintained at temperatures of 12, 15, 18, and 21 degrees C for a period of 19 weeks. Regular determinations were made of ammonia excretion rate following which animals were sacrificed for estimation of dry meat weight, dry shell weight, biochemical composition, and gonadal development. T. philippinarum increased from an initial dry meat weight of 291.5 mg to final values of 957.9, 733.0, 735.0, and 586.0 mg at 12, 15, 18, and 21 degrees C, respectively. An initial increase in percentage carbohydrate content was evident at all temperatures. This was followed by carbohydrate depletion associated with gametogenesis, the transition from accumulation to depletion occurring earlier with increasing temperature. Ripe gonadal material was evident at all temperatures, but spawning was only evident at 15, 18, and 21 degrees C. Ammonia excretion at 12, 15, and 18 degrees C showed an allometric relationship to meat weight; this was not so at 21 degrees C. (Deal-EIS)

BACTERIAL STREAMER GROWTH IN A DISUSED PYRITE MINE,
University Coll. of North Wales, Bangor. Dept. of Biochemistry and Soil Science.
D. B. Johnson, W. I. Kelso, and D. A. Jenkins.
Environmental Pollution, Vol. 18, p 107-118, 1979. 5 fig, 3 tab, 22 ref.

Descriptors: *Acid mine water, *Acid streams, *Thiobacillus ferrooxidans, Acidic water, Mine drainage, Mine wastes, Pyrite, Iron, Sulfates, Hydrogen ion concentration, Bacteria, Acid bacteria, Sulfur bacteria, Water chemistry, Chemical analysis, Seasonal.

A disused pyrite mine in the Conwy Valley, North Wales, was found to contain copious amounts of 'acid streamer' of heterotrophic bacterial origin. The geology of the mine is discussed and analytical data on the acid stream which flows through the mine are presented. The UV and visible spectra of the typically orange/red-coloured water were investigated and the main ionic species responsible for the colour identified as being Fe(OH)2(+), Fe(SO4)2(-), Fe(SO4)(+). The local pollution caused by the acid discharge is mentioned. (Deal-EIS)

MERCURY ACCUMULATION IN IPOMOEA AQUATICA (FORSK) NEAR A CAUSTIC SODA FACTORY IN THAILAND,
Helsinki Univ. (Finland). Dept. of Environmental Science.
S. Suckcharoen.
Water, Air and Soil Pollution, Vol. 10, p 451-455, 1979. 2 fig, 19 ref.

Descriptors: *Mercury, *Industrial wastes, *Food chains, *Bioaccumulation, *Tissue analysis, *Thailand, *Ipomoea, Path of pollutants, Heavy metals, Chemical wastes, Plant physiology, Public health, Human pathology, Chemical analysis, Water quality standards.

Ipomoea aquatica is commonly used as a vegetable and pig food in Thailand. The present study shows that the leaves and floating stems of this plant collected near a caustic soda factory in Thailand had accumulated between 0.75 to 1.26 ppm (average 0.95 ppm) Hg in the leaves and 0.28 to 0.68 ppm (average 0.43 ppm) Hg in the floatingstems. Leaves and floating stems from unpolluted areas had Hg contents between 0.1 to 0.17 ppm and 0.01 to 0.06 ppm, respectively. The contaminated I. aquatica in the study are represents an additional source of Hg, since fish from the same area are also polluted with Hg. This constitutes a serious risk to public health. (Deal-EIS)
W79-07653

TOXICITY OF PERMETHRIN, DECAMETHRIN, AND RELATED PYRETHROIDS TO SALMON AND LOBSTER,
Fisheries and Marine Service, St. Andrews (New Brunswick). Biological Station.
V. Zitko, D. W. McLeese, C. D. Metcalfe, and W. G. Carson.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 338-343, 1979. 3 tab, 8 ref.

Descriptors: *Insecticides, *Pesticide toxicity, *Lobsters, *Atlantic salmon, *Pyrethroids, *Permethrin, *Decamethrin, Toxicity, Mortality, Chemical properties, Bioassay, Juvenile growth state, Chemical analysis, Lethal limit, Gas chromatography.

The lethalities of permethrin, its 1R-cis-isomer, decamethrin, and its dichloro angalogue to juvenile Atlantic salmon (Salmo salar) and adult lobster (Homarus americanus) were determined. As expected from the insecticidal activity patterns, 1R-cis permethrin is more lethal than permethrin to both salmon and lobsters. The lethalities of the cyano-substituted pyrethroids are higher than one would expect from the lethality-octanol/water partition coefficient relationship, derived previously. (Deal-EIS)
W79-07654

ALKANES IN PLANKTON FROM THE BUCCANEER OILFIELD,
Houston Univ., TX. Dept. of Biophysical Sciences.
B. S. Middleditch, E. S. Chang, and B. Basile.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 421-427, 1979. 3 tab, 13 ref.

Descriptors: *Oil, *Oil pollution, *Zooplankton, *Biogenic hydrocarbons, *Alkanes, *Tissue analysis, Offshore platforms, Brines, Metabolism, Organic compounds, Oil spills, Gas chromatography, Chemical analysis, Path of pollutants.

Samples of zooplankton were examined to determine whether they contain petroleum alkanes and whether they might contribute significantly to the dispersion of oil discharged from the production platforms. The total alkane concentrations ranged from 250 ppb to 3.58 ppm. There was also a wide variation in the distribution of alkanes from sample to sample, reflecting species differences. In general, the samples from the center of the oilfield were contaminated with petroleum alkanes while those samples collected at distances from the oilfield predominantly contained biogenic alkanes. (Deal-EIS)

MERCURY POLLUTION OF MEDITERRANEAN SEDIMENTS AROUND ALEXANDRIA, EGYPT,
Alexandria Univ. (Egypt). Faculty of Science.
M. K. El-Sayed, Y. Halim, H. M. Abdel-Kader, and M. H. Moeness.
Marine Pollution Bulletin, Vol. 10, p 84-86, 1979. 1 fig, 3 tab, 11 ref.

Descriptors: *Mercury, *Industrial wastes, *Bottom sediments, *Egypt, Chemical wastes, Path of pollutants, Heavy metals, Sediments, Beaches, Sands, Sewage effluent, Water pollution sources, Chemical analysis, Spectrophotometry, Chlor-alkali plants.

Elemental mercury is associated with industrial wastes discharged through the main effluent pipe of the Chlorine-Alkali plant at El-Max area west of Alexandria. The minimal mercury value of 0.1 ppm dry weight is assumed to be the background level for uncontaminated sediments in the area. Mercury levels ranged from 8.02 to 15.5 ppm in the beach sands from the polluted area beyond the plant, and from 0.14 to 1.4 ppm in the bottom sediments off Alexandria. The Chlorine-Alkali plant is obviously the major source of mercury pollution. The contribution of land drainage, agricultural and domestic wastes is insignificant. (Deal-EIS)
W79-07656

ZINC AND COPPER LEVELS IN BELFAST LOUGH,
Northern Ireland Polytechnic Jordanstown. School of Life Sciences.
M. S. McGrath, and J. Austin.
Marine Pollution Bulletin, Vol. 10, p 86-88, 1979. 1 fig, 2 tab, 6 ref.

Descriptors: *Zinc, *Copper, *Biochemical oxygen demand, *Dissolved oxygen, *Irish Sea, *Belfast Lough(Ireland), Heavy metals, Municipal wastes, Industrial wastes, Water quality, Water chemistry, Chemical analysis, Spectrophotometry, Waste disposal.

A survey of dissolved zinc, copper, oxygen and biochemical oxygen demand in Belfast Lough has been carried out. Zinc and to a lesser extent copper occur at elevated levels compared with a non-industrialized area of the Irish Sea. Zinc levels are particularly high in the marginal waters of the north shore of the lough. Dissolved oxygen and biochemical oxygen demand levels indicate that pollution of the lough by oxygen-demanding wastes is not a serious problem. (Deal-EIS)

STUDIES ON THE TOXICITY OF PULP AND PAPER FACTORY WASTES TO THE FISH NOTOPTERUS NOTOPTERUS (PALLAS),
D.A.V. Coll., Muzaffarnagar (India). Pollution-Relevant Research Lab.
S. R. Verma, G. R. Shukla, and R. C. Dalela.
Acta Hydrochimica et Hydrobiologica, Vol. 6, p 541-552, 1978. 8 tab, 23 ref.

Descriptors: *Bioassay, *Pulp wastes, *Toxicity, *Notopterus, Pulp and paper industry, Industrial wastes, Chemical wastes, Water temperature, Hydrogen ion concentration, Dissolved oxygen, Fish physiology, Chemical analysis, Water chemistry, Mortality, Fish behavior.

Studies are performed on the toxicity for 24, 48, 72 and 96 hours in the static test with dilutions of wastewaters from pulp and paper production as well as of the mixed wastewater. The pulp waste shows the highest toxic effect. A general increase of the toxic effect is caused by a rise in temperature from 26 degrees C to 36 degrees C and an increase of the pH value from 7.5 to 8.2. The increase of the oxygen concentration from 5.2 to 7.2 mg/l results in a reduction of the toxicity of the pulp and mixed wastes, the size of fishes having a significant effect only for the pulp waste. (Deal-EIS)
W79-07659

DOMINANCE AND DISTRIBUTION OF BENTHIC MACROPHYTE ASSEMBLAGES IN A NORTH FLORIDA ESTUARY (APALACHEE BAY, FLORIDA),
Florida State Univ., Tallahassee. Dept. of Biological Science.
M. S. Zimmerman, and R. J. Livingston.
Bulletin of Marine Science, Vol. 29, No. 1, p 27-40, 1979. 3 fig, 4 tab, 13 ref.

Descriptors: *Pulp wastes, *Biological communities, *Toxicity, Algae, *Diversity, *Species diversity, Florida, Pulp and paper industry, Industrial wastes, Chemical wastes, Aquatic populations, Rhodophyta, Benthic flora, Water pollution effects, Biomass, Dominant organisms, Apalachee Bay.

A comparative analysis was made concerning the distribution of benthic macrophyte assemblages in shallow portions of Apalachee Bay (north Florida). This included a comparison of areas affected by bleached kraft mill effluents (BKME) (the Fenholloway River system) with appropriate uncontaminated control stations (the Econfina River system). Meter-square samples of benthic macrophytes were collected monthly in both areas. Relative dominance was generally higher in the unpolluted areas. Areas of acute effect were found to have extremely low biomass and characteristic assemblages of various macrophyte species. Most of the species in unpolluted areas were present in portions of the bay characterized by chronic (low) levels of BKME. However, biomass was consistently reduced in such areas when compared to control stations. It was postulated that selective removal of dominant species by BKME (e.g., increased levels of color and turbidity) allowed recruitment of various 'rare' species in areas of chronic impact, thus contributing to anomalous patterns of community structure when compared to published data from other pollution-stressed aquatic systems. (Deal-EIS)

PHYTOPLANKTON COMMUNITY OF AN ACIDIFIED, HEAVY METAL-CONTAMINATED LAKE NEAR SUDBURY, ONTARIO: 1973-1977,
Ontario Ministry of the Environment, Rexdale. Limnology and Toxicity Section.
N. D. Yan.
Water, Air and Soil Pollution, Vol. 11, No. 1, p 43-55, 1979. 4 fig, 3 tab, 32 ref.

Descriptors: *Phytoplankton, *Heavy metals, *Lakes, *Peridinium, Acidic water, Biomass, Biological communities, Phosphorus, Hydrogen ion concentration, Water chemistry, Canada, Seasonal, Spectrophotometry, Chlorophyta, Chrysophyta, Cyanophyta, Sudbury, Ontario.

Phytoplankton data for 1973 to 1977 from Clearwater Lake, an acid- and heavy metal-contaminated lake near Sudbury, Ontario are presented. Peridinium inconspicuum comprised between 30 and 55% of the average, ice-free period biomass of 0.33 to 0.73 mg/l and is considered indicative of acidic lakes if it forms a substantial portion of the total biomass. The data were compared with those from three other contaminated and ten uncontaminated lakes in Ontario. The phytoplankton communities of all contaminated lakes were dominated by P. inconspicuum while chrysophytes dominated the uncontaminated lakes. Community biomass was better correlated with phosphorus concentration than with hydrogen ion concentration. There was some evidence of reductions of biomass in lakes with the highest heavy metal concentrations. Limitations of phytoplankton data collected in synoptic surveys are discussed. (Deal-EIS)
W79-07661

COMPARISON OF THE EFFECTS OF FOURTEEN-DAY AND CHRONIC EXPOSURES TO A POLYCHLORINATED BIPHENYL, AROCLOR 1242, ON MOLTING OF THE FIDDLER CRAB, UCA PUGILATOR,
Tulane Univ., New Orleans, LA. Dept. of Biology.
S. W. Fingerman, and M. Fingerman.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 352-357, 1979. 2 fig, 14 ref.

Descriptors: *Polychlorinated biphenyls, *Crabs, *Toxicity, *Aroclors, *Molting, *Ecdysis, *Uca, Bioassay, Laboratory tests, Growth stages, Growth rates, Animal metabolism, Pesticide toxicity, Chlorinated hydrocarbon pesticides, Inhibition, Water pollution effects.

The object of the present experiments was to determine whether the inhibitory effect of Aroclor 1242 on molting of the fiddler crab can be at least partially reversed by returning the crabs to sea water that did not contain this pollutant after they had been exposed to it for 14 days. It was discovered that crabs removed from the effect of Aroclor-1242 underwent ecdysis at a faster rate (7%) than those kept continuously in PCB-contaminated water, but still at a much slower rate than the control group. It appears that once the crabs had been exposed for 14 days they accumulated enough PCB to have a long-lasting inhibitory effect on molting. (Deal-EIS)
W79-07662

THE INFLUENCE OF REARING DENSITY ON THE SUBSEQUENT RESPONSE TO DDT DOSING FOR TADPOLES OF THE FROG RANA TEMPORARIA,
Institute of Terrestrial Ecology, Huntingdon (England). Monks Wood Experimental Station.
A. S. Cooke.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 837-841, 1979. 2 tab, 10 ref.

Descriptors: *DDT, *Frogs, *Pesticide toxicity, *Tadpoles, *Tissue analysis, *Bioaccumulation, *Rana, Growth stages, Growth rates, Animal populations, Density, Chlorinated hydrocarbon pesticides, Pesticide kinetics, Path of pollutants, Pesticide residues, Animal behavior, Animal physiology.

By rearing at two densities that differed five-fold, tadpoles were produced that differed in weight, by a factor of about two-fold. When treated with DDT(0.1ppm), the large tadpoles showed no poisoning symptoms under conditions that caused appreciable sublethal effects amongst the small tadpoles. Relative to tadpoles in the field or in stock captive cultures, neither the small nor the large tadpoles were particularly unusual as regards size, although both tended towards the extremes of the normal size range. In addition, the small tadpoles accumulated higher body burdens of DDT. (Deal-EIS)
W79-07663

OXYGEN CONSUMPTION IN LEPOMIS MACHROCHIRUS EXPOSED TO 2,4-D OR 2,4,5-T,
Clemson Univ., SC. Dept. of Zoology.
C. Sigmon.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 826-830, 1979. 2 tab, 11 ref.

Descriptors: *2,4-D, *2,4,5-T, *Pesticide toxicity, *Sunfishes, *Tissue analysis, Water pollution effects, Lepomis, Bluegill sunfish, Respiration, Oxygen requirements, Herbicides, Chlorinated hydrocarbon pesticides, Water temperature, Chemical analysis, Fish physiology, Absorption.

Respiratory changes and herbicide uptake by Lepomis machrochirus were analyzed following short-term exposure to 3 ppm of 2,4-D or 2,4,5-T at three water temperatures (20, 25, 30 degrees C). While weight and temperature were found to be significant variables in determining respiration, exposure to the herbicides was not. Herbicide uptake was quite small. More 2,4,5-T than 2,4-D was retained by the fish. Since 2,4-D is more rapidly degraded by microorganisms, less would be available for uptake. (Deal-EIS)
W79-07664

THE EFFECTS OF AN EXPERIMENTAL SPILLAGE OF OIL SANDS TAILINGS SLUDGE ON BENTHIC INVERTEBRATES,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
D. R. Barton, and R. R. Wallace.
Environmental Pollution, Vol. 18, p 305-312, 1979. 4 tab, 15 ref.

Descriptors: *Oil spills, *Toxicity, *Benthic fauna, *Crude oil, Oil pollution, Oil, Organic compounds, Canada, Bioindicators, Sediments, Bottom sediments, On-site investigations, Heavy metals, Sands, Alberta, Benthos, Aquatic insects.

A very minor, instantaneous spillage of oil sands tailings sludge was introduced experimentally to a small part of a river in northern Alberta, Canada. A 60% reduction in the standing stock of benthic invertebrates occurred throughout a four-week period in the immediate area of the spillage. Sensitive indicator organisms decreased in abundance over an area of at least 30 m downstream of the spillage. The tailings sludge contained fine silt, heavy, sticky oils and heavy metals, all of which would have a deleterious effect on stream benthos. The fine silt mixed with the sticky oils of the sludge probably constituted the principal hazard to aquatic communities. It is recommended that appropriate measures should be established so as to prevent the addition of oil sands tailings sludge, by either accident or design, to lakes or rivers. (Deal-EIS)
W79-07665

OXYGEN CONSUMPTION IN DAPHNIA PULEX EXPOSED TO 2,4-D OR 2,4,5-T,
Clemson Univ., SC. Dept. of Zoology.
C. Sigmon.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 822-825, 1979. 2 tab, 6 ref.

Descriptors: *Pesticide toxicity, *Daphnia, *Oxygen requirements, *2,4-D, *2,4,5-T, Oxygen, Chlorinated hydrocarbon pesticides, Herbicides, Toxicity, Water temperature, Chemical analysis, Respiration, Animal physiology, Water pollution effects.

Oxygen consumption by Daphnia pulex was measured for 9 hours following exposure to two concentrations (1,3ppm) of 2,4-D or 2,4,5-T at three water temperatures (20, 25, 30 degrees C). A general trend of increased respiration at 30 degrees C was apparent in both the 2,4-D and 2,4,5-T experiments, although the differences achieved statistical significance only in the 2,4,5-T data. The physiological basis for the effect of these herbicides on respiration is not known. (Deal-EIS)

ORGANOCHLORINE INSECTICIDE RESIDUES IN AMPHIBIANS AND REPTILES FROM IOWA AND LIZARDS FROM THE SOUTHWESTERN UNITED STATES,
Iowa State Univ., Ames. Dept. of Entomology.
F. Punzo, J. Laveglia, D. Lohr, and P. A. Dahm.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 842-848, 1979. 2 tab, 8 ref.

Descriptors: *Pesticide residues, *Reptiles, *Amphibians, *Tissue analysis, *Lizards, Chlorinated hydrocarbon pesticides, Chemical analysis, Pesticide kinetics, Iowa, Southwest U.S., DDT, Dieldrin, DDE, Toads, Heptachlor, Frogs, Food chains, Snakes.

Ecosystems are generally contaminated with low levels of organochlorine insecticide residues. Numerous reports of residues in biota include relatively little data for amphibians and reptiles. To help fill this void, specimens of amphibians and reptiles were collected from 2 agricultural areas of Iowa, and lizards were collected from nonagricultural areas in Arizona, New Mexico, and Texas. Iowa specimens came from a region with past use of organochlorine insecticides, particularly DDT as a general purpose insecticide and aldrin and heptachlor for control of soil-insect pests. Only residues of DDE and dieldrin in viscera of toads and of DDE, dieldrin, heptachlor epoxide in fat and eggs from reptiles were found in specimens collected in Iowa. Low or nondetectable residues of DDE and dieldrin were found in carcass and viscera samples from lizards collected in the southwestern United States. (Deal-EIS)
W79-07667

EMBRYOTOXICITY AND HATCHABILITY IN CICHLASOMA NIGROFASCIATUM (GUENTHER) EGGS AND LARVAE BRIEFLY EXPOSED TO LOW CONCENTRATIONS OF ZINC AND COPPER IONS,
Uppsala Univ. (Sweden). Inst. of Zoology.
P. T. E. Ozoh, and C.-O. Jacobson.

Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 782-786, 1979. 2 tab, 11 ref.

Descriptors: *Zinc, *Copper, *Toxicity, *Cichlids, *Zebrafish, *Mutagens, Fresh water fish, Fish eggs, Larval growth stage, Embryonic growth stage, Hatching, *Metals, Fish physiology, Ions, Mortality, Bioassay.

Zebra cichlid eggs were exposed to 0, 16 and 32 ppb of zinc and copper singly and in combination. The presence of copper ions affected both eggs and larvae. The pro-larvae and larvae exposed to copper ions for 48 h showed many morphological malformations, especially in the nervous system. Zinc ions caused no observable malformations in eggs or larvae. In terms of hatchability, zinc had a more severe effect. This was to copper's bacteriocidal effect at low concentrations, which facilitated hatching. For the two factor interactions of zinc and copper, concentrations of 32 ppb zinc and 16 ppb produced the lowest hatching success. (Deal-EIS)

INDUCTION OF BENZO (A) PYRENE MONOOXYGENASE IN FISH AND THE SALMONELLA TEST AS A TOOL FOR DETECTING MUTAGENIC/CARCINOGENIC XENOBIOTICS IN THE AQUATIC ENVIRONMENT,

Institut Rudjer Boskovic, Zagreb (Yugoslavia). Lab. for Marine Molecular Biology.
B. Kurelec, Z. Motajaseric, M. Rijarec, M. Alaceric, and S. Britvic.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 799-807, 1979. 1 fig, 1 tab, 23 ref.

Descriptors: *Toxicity, *Carp, *Enzymes, *Salmonella, *Mullets, *Mutagens, *Carcinogens, *Tissue analysis, *Crude oil, *Hexane, *Aflatoxin, Chemical analysis, Organic compounds, Fish physiology, Sea water, Path of pollutants.

Considering the induction of Benzopyrene Monoxygenase as a means of detoxification in fish, we studied the consequences of i/p application of polluted water extracts from different marine sites to young carp. Aliquots of these extracts served in Salmonella/microsome mutagenicity tests using liver homogenates of pollution-induced fish as activating systems. The pollutants tested were hexane, commercial corn oil, aflatoxin, NADP, NADPH, glucose-6-phosphate, dimethyl sulphoxide, and benzo(a)pyrene. A single i/p injection of 25 or 50 ug benzo(a)pyrene, 25 ug aflatoxin, 50 ul crude oil and hexane extract of seawater was sufficient to induce BPMO activity in carp within one or two days. The ability of the compounds to induce mutations in Salmonella typhimurium was influenced by the presence of liver postmitochondrial fraction. (Deal-EIS)
W79-07669

SCHEMA OF LETHAL ACTION OF COPPER ON MUSSELS,

Centre Oceanologique de Bretagne, Brest (France).
J. L. M. Martin.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 808-814, 1979. 3 fig, 1 tab, 14 ref.

Descriptors: *Copper, *Toxicity, *Mussels, *Bioaccumulation, *Tissue analysis, *Mytilus, Bioassay, Chemical analysis, Path of pollutants, Chemical reactions, Lethal limit, Bioassay, Animal physiology, Animal metabolism, Metals, Spectrophotometry, Chemical properties, Mode of action.

In order to demonstrate the relationships between concentration, lethal time and bioaccumulation levels and rates in determining the response of an organism to a toxic element, experiments were carried out on Mytilus edulis using copper as the test element. The results show that the toxicity of copper to mussels is regulated by a two step reaction. The first factor is the speed of accumulation in the test organism while the second determining factor is the speed of action of the test element in producing toxic effects at the target organ(s). (Deal-EIS)
W79-07670

ACUTE TOXICITY OF DECHLORINATED DDT, CHLORDANE AND LINDANE TO BLUEGILL (LEPOMIS MACROCHIRUS) AND DAPHNIA MAGNA,

Army Medical Bioengineering Research and Development Lab., Fort Detrick, MD.
W. F. Randall, W. H. Dennis, and M. C. Warner.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 849-854, 1979. 2 tab, 9 ref.

Descriptors: *DDT, *Pesticide toxicity, *Daphnia, *Sunfishes, *Catalysts, *Chlordane, *Lindane, *Dechlorination, Zooplankton, Fresh water fish, Chlorinated hydrocarbon pesticides, Chemical analysis, Chemical reactions, Catalysts, Nickel, Chemical wastes, Waste disposal, Insecticides, Bioassay, Waste treatment.

The purpose was to test the effectiveness of Ni2B-catalyzed dechlorination in reducing the acute toxicity of DDT, chlordane and lindane to bluegill and daphnia. It was discovered that the acute toxicity of DDT and chlordane formulations was considerably reduced by nickel boride-catalyzed dechlorination. However, the reduction in toxicity was not sufficient to warrant the use of this method for the ultimate disposal of these pesticides. The dechlorination of lindane by this method appears to have potential as a chemical disposal procedure. (Deal-EIS)

THE REPRODUCTION BEHAVIOR OF GAMMARUS DUEBENI (LILLJEBORG), AND THE INHIBITORY EFFECT OF A SURFACE ACTIVE AGENT,

Southampton Univ. (England). Dept. of Oceanography.
M. C. Lyes.
Marine Behavior and Physiology, Vol. 6, p 47-55, 1979. 5 fig, 16 ref.

Descriptors: *Animal behavior, *Reproduction, *Surfactants, *Toxicity, *Gammarus, *Chemoreceptors, *TWEEN 80, *Pheromones, Bioassay, Inhibition, Bioassay, Crustaceans, Chemical analysis, Animal physiology, Amphipoda.

The process by which reproductive behavior in the male Gammarus duebeni is evoked has been found to depend upon the reception of a chemical cue from the female. This cue is perceived by receptors on the second antennae and its function is to synchronize mating with the suitable phase of ecdysis in the female. Small concentrations of the surfactant TWEEN80 are shown to interfere with the reception of this chemical cue, resulting in a decrease in mating success. (Deal-EIS)

CHEMOSENSORY INDUCED BRADYCARDIA IN THE KELP CRAB, PUGETTIA PRODUCTA (RANDALL),

California Univ., Santa Barbara. Dept. of Biological Sciences.
R. K. Zimmer, D. P. Cook, and J. F. Case.
Journal of Experimental Marine Biology and Ecology, Vol. 38, p 135-150, 1979. 5 fig, 5 tab, 31 ref.

Descriptors: *Animal physiology, *Crabs, *Inhibition, *Carbohydrates, *Chemoreceptors, *Water soluble fraction, Animal metabolism, Chemical analysis, Amino acids, Oil, Toxicity, Organic compounds, Crustaceans, Chemical properties.

Bradycardia was induced in specimens of Pugettia producta by chemical stimulation of the branchial chamber with synthetic clam extract. Chemical stimulation of the dactyls, antennules, and mouthparts did not effect cardiac inhibition. Stimulation of the branchial chamber with amino acids and sugars evoked cardiac inhibition that was significantly greater than that induced by sea-water controls. Of the sugars tested, disaccharides were generally found to have a greater capacity to induce bradycardia than monosaccharides. The possibility of a disaccharide or polysaccharide receptor is discussed. Taurine and B-alanine induced bradycardia was significantly greater than that effected by other amino acids. All tested amino acids were, however, at least mildly effective ($P < 0.10$); thus it appears that several types of amino-acid receptors are likely to exist. From these results and from observations described by other investigators, it is apparent that the branchial chamber is a major chemoreceptive site in decapod crustaceans. (Deal-EIS)

IN VIVO EFFECT ON ATPASE IN CERTAIN TISSUES OF LABEO ROHITA AND SACCOBRANCHUS FOSSILIS, FOLLOWING CHRONIC CHLORDANE INTOXICATION,

D. A. V. Coll., Muzaffarnagar (India). Pollution Relevant Research Lab.
S. R. Verma, S. K. Bansal, A. K. Gupta, and R. C. Dalela.
Bulletin of Environmental Contamination and Toxicology, Vol. 20, p 769-777, 1978. 2 tab, 18 ref.

Descriptors: *Pesticide toxicity, *Enzymes, *Tissue analysis, *Chlordane, *Labeo, *Saccobranchus, Chlorinated hydrocarbon pesticides, Biochemistry, Fish physiology, Chemical analysis, Sodium, Potassium, Magnesium, Freshwater fish.

The purpose of this study was to determine the effect of various concentrations of chlordane upon the ATPase system in the brain, gill, liver and kidney or two fresh water teleosts, Labeo rohita and Saccobranchus fossilis, following chronic chlordane intoxication after 30 and 60 days treatment. Mg++, Na+ and K+ ATPases were analyzed. The present investigation observed inhibition of all the three ATPases in both fish Labeo rohita and Saccobranchus fossilis in all tissues, following chronic chlordane treatment. However, inhibition of ATPases in all the tissues of Labeo rohita was found higher as compared to Saccobranchus fossilis, indicating more susceptibility of the former to chlordane. (Deal-EIS)

DISTRIBUTION OF CHAETOGNATHS ALONG THE SALINITY GRADIENT IN THE COCHIN BACKWATER, AN ESTUARY CONNECTED TO THE ARABIAN SEA,

National Inst. of Oceanography, Cochin (India); and Indian Ocean Biological Centre.
V. R. Nair.
Journal of the Marine Biological Association of India, Vol. 16, No. 3, p 721-730, 1974. 5 fig, 1 tab, 15 ref.

Descriptors: *Fish populations, *Salinity, *Chaetognaths, Temporal distribution, Diel migration, Spatial distribution, Seasonal, Monsoons, Estuaries, Growth stages, Fish behavior, Fish migration, Diurnal distribution, Arabian Sea, India.

A study was made of the chaetognaths of the Cochin Backwater. Krohnitta pacifica Aida, Sagitta bedoti Beraneck, Sagitta enflata Grassi and S. oceania Gray were the species found in the collections. S. bedoti was the dominant chaetognath. S. oceania is recorded for the first time from Indian waters. Salinity plays a major part in controlling the distribution of chaetognaths in this estuary. They penetrated to the southernmost part of the estuary during the premonsoon period when a uniform high salinity prevailed throughout the system. In the postmonsoon period the chaetognath population synchromically followed the steep gradient in salinity along the estuary and became restricted to its seaward end. It is suggested that during the monsoon period they are removed from the area and fresh recruits from the sea are brought back to the system along with the incoming waters of the postmonsoon periods. INTERTIDAL ECOLOGY OF THE SEA SHORE NEAR TARAPUR ATOMIC POWER STATION,
Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.
M. C. Balani.
Journal of the Marine Biological Association of India, Vol. 17, No. 1, p 101-106, 1975. 2 fig, 6 ref.

Descriptors: *Nuclear powerplants, *Littoral, Tides, Beaches, Radioisotopes, Intertidal areas, Shores, Seasonal, Oysters, Clams, Manganese, Zinc, Potassium, Iodine, Iron, Strontium, Food chains, Crabs, Tarapur Atomic Power Station.

Surveys were carried out between March 1969 and August 1970 to study the fauna and flora in the littoral zone of the sea shore near the Tarapur Atomic Power Station. The beach adjacent to the station is rocky with a number of tidal pools inhabited by a variety of organisms whereas the beach to the south is mostly sandy and barren except for a small rocky stretch. The tidal range is 6 m and over a mile of beach is exposed during low tide. The near shore currents are very strong and have a clear north-south oscillation with the changing tides. Less Atherina sp. fry were available near the Power Station in March 1970 than during the previous year. Possible reasons for these differences are discussed, including the effect of heated discharges on biota. The need is also emphasized to monitor the biota (Plankton, Nekton and Benthos) systematically for content of fission products released by the Power Station. (Deal-EIS)

KEPONE: TOXICITY AND BIOACCUMULATION IN BLUE CRABS,
Environmental Research Lab., Gulf Breeze, FL.
S. C. Schimmel, J. M. Patrick, Jr., L. F. Faas, J. L. Oglesby, and A. J. Wilson, Jr.
Estuaries, Vol. 2, No. 1, p 9-15, 1979. 4 fig, 3 tab, 11 ref.

Descriptors: *Toxicity, *Crabs, *Insecticides, *Kepone, *Bioaccumulation, *Depuration, *Callincetes, *Tissue analysis, *James River(Virginia), Blue crabs, Absorption, Animal physiology, Path of pollutants, Oysters, Pesticide residues, Pesticide kinetics, Mortality, Pesticide toxicity.

Two long-term studies were conducted to determine toxicity, uptake and depuration of Kepone in blue crabs (Callinectes sapidus). In the first, Kepone was administered to crabs in seawater or food. Uptake of Kepone in 28 days was primarily through the contaminated oysters. When these crabs were held in Kepone-free seawater and fed Kepone-free oysters for 28 days, no loss of the insecticide was evident. There were adverse effects on molting and survival in crabs fed oysters that contained 0.25 micrograms/g Kepone. A second study was conducted to determine: (1) the depuration of Kepone over a 90-day period in blue crabs fed oysters from the James River, Virginia (containing 0.15 micrograms/g Kepone); and (2) the effects of Kepone on molting and survival of blue crabs fed James River oysters or laboratory-contaminated oysters that contained 0.15 or 1.9 micrograms/g Kepone. Crabs fed Kepone-contaminated oysters followed by a diet of Kepone-free oysters for 90 days had detectable concentrations of the insecticide in tissues. Also, blue crabs that ate oysters containing Kepone in concentrations similar to those found in oysters from the James River, died or molted less frequently than crabs fed Kepone-free oyster meats. A MATHEMATICAL MODEL FOR THE UPTAKE OF HEAVY METALS IN BENTHIC ALGAE,
Central Inst. for Industrial Research, Oslo (Norway).
K. L. Seip.
Ecological Modelling, Vol. 6, p 183-197, 1979. 12 fig, 4 tab, 11 ref.

Descriptors: *Heavy metals, *Marine algae, *Methodology, *Mathematical models, *Zinc, Algae, Mathematical studies, Benthic flora, Water pollution effects, Path of pollution, Toxicity, Chemical analysis, Biomass, Mortality, Sea water, Simulation studies, Ascophyllum nodosum.

A mathematical model for the uptake of heavy metals in the benthic algae Ascophyllum nodosum has been developed. The model allows assignment of age-dependent growth parameters which also may be a function of external factors. Mortality curves for A. nodosum corresponding to a highly polluted and a nearly unpolluted area have been used in the study of metal uptake. Uptake has been simulated for different values of growth parameters and different concentrations of heavy metals in seawater. Emphasis has been on the uptake of zinc. The simulations showed that the concentration of zinc in the algae changed much less (6%) than the biomass (30%) with changes in intrinsic growth rate, mortality and carrying capacity. The concentration in the algae was found to be an approximately linear function of the mean concentration in seawater up to about 100 ppb. At very high concentrations, associated with high mortality, the deviation from linearity may be significant (about 13% at 162 ppb at one locality). The calculation indicates further that variations in the zinc concentration in the seawater are considerably damped in the algae. Simulations have also been performed to study the effects of sampling different parts of the algae, and some initial simulations have been performed to study the effects of heavy metal exchange between algae and sea water. W79-07680

GROWTH DYNAMICS OF CORDGRASS, SPARTINA ALTERNIFLORA, LOISEL., ON CONTROL AND SEWAGE SLUDGE FERTILIZED PLOTS IN A GEORGIA SALT MARSH,
Georgia Univ., Sapelo Island. Marine Inst.
E. B. Haines.
Estuaries, Vol. 2, No. 1, p 50-53, 1979. 4 fig, 1 tab, 13 ref.

Descriptors: *Sewage sludge, *Plant growth, *Growth rates, *Cordgrass, *Spartina, Fertilizers, Sewage sludge disposal, Biomass, Nitrogen, Nitrogen compounds, Seasonal, Salt marshes, Soils, Estuaries.

Seasonal plant growth dynamics were followed for a year in undisturbed plots of tall and short form Spartina alterniflora and in plots of short form S. alterniflora which were enriched with sewage sludge. Monthly determinations of aboveground live and dead biomass, density of live stems, the ratio of number of young shoots to total number of shoots, and belowground mass of macro-organic matter to a depth of 30 cm were made for each area. Sludge fertilization increased the live biomass of the short form S. alterniflora by up to 150% of the control live biomass, but had little effect on the dead biomass, stem density, or proportion of young shoots. There was a trend of increased amount of belowground macroorganic matter in fertilized compared to control plots during the last 6 months of the study. In all areas, there was a marked decrease in the proportion of young shoots from winter to early summer, followed by a rapid increase in the percent of young shoots from late summer to fall. Sampling of plots 7 and 20 months after termination of sludge enrichment showed higher plant biomass and % N content in surface soils, but no difference in N content of live plant tissue, in fertilized compared to unfertilized marsh. After 20 months, about half of the sludge nitrogen remaining in the soils of the fertilized plots had disappeared. (Deal-EIS)
W79-07681

DISTRIBUTION OF MIREX IN AN EXPERIMENTAL ESTUARINE ECOSYSTEM,
Environmental Research Lab., Gulf Breeze, FL.
W. P. Schoor.
Bulletin of Environmental Contamination and Toxicology, Vol. 21, p 315-321, 1979. 1 fig, 2 tab, 12 ref.

Descriptors: Pesticide kinetics, *Shrimp, Laboratory tests, Water pollution effects, *Tissue analysis, *Bioaccumulation, *Mirex, *Palaemonetes, *Thalassia, Pesticide residues, Grasses, Path of pollutants, Estuarine environment, Ecosystems, Gas chromatography, Chemical analysis, Animal metabolism.

The purpose of these experiments was to determine the movement and accumulation of mirex in an experimental ecosystem by utilizing a method of introducing mirex that is representative of what occurs in the natural environment. Experimental aquaria contained sand, grass plants (Thalassia) and grass shrimp (Palaemonetes) in artificial seawater. Test aquaria were exposed to varying concentrations of mirex, then sampled over a period of two weeks. Results showed that the shrimp hepatopancreas was the only living component in which the concentration of mirex increased throughout the test period. Small but constant levels were detected in other shrimp tissues and grass, probably due to adsorption. (Deal-EIS)
W79-07682

THE EFFECTS OF TEMPERATURE AND DIFFERENT FOOD ORGANISMS ON THE RATE OF GASTRIC EVACUATION IN PERCH (PERCA FLUVIATILIS),
Lund Univ. (Sweden). Limnology Inst.
L. Persson.
Freshwater Biology, Vol. 9, p 99-104, 1979. 3 fig, 4 tab, 23 ref.

Descriptors: *Digestion, *Fish physiology, *Perches, *Water temperature, *Tissue analysis, *Gammarus, Thermal pollution, Fish food organisms, Zooplankton, Diptera, Annelids, Fish diets, Mathematical models, Animal metabolism.

The rate of gastric evacuation in perch was studied at different mean temperatures (range 4.0-21.7 degrees C). Gastrix evacuation rates were empirically described by an exponential function and the relationship between the instantaneous evacuation rate and temperature was also exponential. Evacuation rates were not significantly different ($P>0.1$) for the following food organisms: Gammarus pulex, Chaoborus, chironomids and zooplankton. The effects of temperature, different food organisms and fish size on the evacuation rates in different fish species are discussed. (Deal-EIS)

SOME ECOLOGICAL EFFECTS OF THE VENPET - VENOIL COLLISION,
Department of Industries, Sea Point (South Africa). Sea Fisheries Branch.
A. Moldan, P. Chapman, and H. O. Fourie.
Marine Pollution Bulletin, Vol. 10, p 60-63, 1979. 2 fig, 16 ref.

Descriptors: *Oil spills, *Oil pollution, *Intertidal areas, *Crude oil, *Winkles, *Limptes, *Barnacles, Path of pollutants, Oil, Organic compounds, Estuaries, Mortality, Tidal effects, Crabs, Beaches, Rivers, Littoral, Estuarine environment, Venpet-Venoil collision, South Africa.

The effects of oil, released after the Venpet-Venoil collision in December 1977, on the intertidal fauna along the South Coast of South Africa have been monitored at monthly intervals since the incident. Localized areas, such as estuaries and sheltered coves, suffered the greatest damage due to the smothering effects of the oil. Damage to the remaining areas has been slight owing to the patchy distribution of the oil together with its physical and chemical characteristics. (Deal-EIS)

MODELLING THE DISTRIBUTION AND EFFECT OF HEAVY METALS IN AN AQUATIC ECOSYSTEM,

Royal Danish School of Pharmacy Copenhagen. Dept. of Chemistry.
S. E. Jorgensen.
Ecological Modelling, Vol. 6, p 199-222, 1979. 7 fig, 11 tab, 77 ref.

Descriptors: *Metals, *Heavy metals, *Methodology, *Model studies, *Geosystems, Environmental effects, Path of pollutants, Toxicity, Sediments, Water, Trophic level, Toxicant exchange, Suspended solids, Suspended matter, Adsorption, Reviews, Freshwater fish, Daphnia, Biomass, Lead, Sea water.

Models are reviewed describing the distribution and effect of heavy metals in an aquatic ecosystem. Since a model used for an impact statement should give the maximum concentration level rather than the seasonal variation, a model focussing on this situation is suggested. The basic differential equations describe (1) the variation in concentration of the toxicant per biomass dry matter in a given trophic level, and (2) the exchange of toxicant between sediment and water. Furthermore, since a substantial part of the heavy metal in an aquatic ecosystem is bound to suspended matter, an equation describing the equilibrium between dissolved and suspended matter must be included. A literature review has been carried out on the parameters used in the above mentioned equations and a demonstration, showing how it is possible to find approximate values for such parameters as excretion coefficient and uptake coefficient on the basis of a relationship between these two parameters and the size of an organism, is given. TRANSPORT, DISTRIBUTION AND TOXIC EFFECTS OF POLYCHLORINATED BIPHENYLS IN ECOSYSTEMS: REVIEW,
Tennessee Univ., Knoxville. Memorial Research Center and Hospital.
E. V. Kalmaz, and G. D. Kalmaz.
Ecological Monitoring, Vol. 6, p 223-251, 1979. 5 tab, 80 ref.

Descriptors: *Water pollution effects, *Toxicity, *Chlorinated hydrocarbons, *Environmental effects, Industrial wastes, Path of pollutants, Transport, Transport depletion, Polychlorinated biphenyls, Ecological distribution, Ecosystems, Chemical analysis, Chemical properties, Chemical reactions, Physical properties, Physicochemical properties, Environmental impacts, Ecological magnification, Trophic level.

Investigation of various aspects of the ecological problems of polychlorinated biphenyls (PCBs) has grown and continues to grow with remarkable intensity. However, it appears that certain areas of PCBs research are developed further than the others. For example, chemical and physical behavior and synthesis of PCBs are well studied, while the metabolism of PCBs and other routes of degradation, including toxicological significance and environmental impact, continue to challenge the scientists. In this paper, the chemical and physical properties of PCBs as well as the implications of these properties for the behavior of PCBs in ecological systems are discussed. The effect of PCBs on interrelated ecological systems are described. The distribution and fate of PCBs in the atmosphere, hydrosphere and lithosphere, and transport of PCBs through these systems are discussed. The toxic significance, biological accumulation and ecological magnification are described at various trophic levels. (Katz-EIS)

UPTAKE FROM SEAWATER AND CLEARANCE OF P,P'-DDT BY MARINE PLANKTONIC CRUSTACEA,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Marine Ecology Lab.
G. C. H. Harding, and W. P. Vass.
Journal of the Fisheries Research Board of Canada, Vol. 36, p 247-254, 1979. 2 fig, 4 tab, 41 ref.

Descriptors: *DDT, *Chlorinated hydrocarbon, *Insecticides, *Zooplankton, Crustacean, Seawater, Biological concentration, Excretion, Clearance rates, Euphausiids, Copepods, Path of pollutants, Water pollution effects, Mathematical studies, Food chain.

A simple exponential model is used to interpret the simultaneous uptake and clearance of p,p'-DDT by euphausiids and copepods to and from seawater. The clearance rate constant for euphausiids, is not significantly different from that observed for copepods. No trend value is detected over the range of p,p'-DDT concentrations in seawater used, 27.8-1388 ng/L. Furthermore, there is a great deal of overlap in the uptake rate constant values between organisms. Uptake rate constants range from 0.76 to 1.21 x 10 to the 4th power/d for euphausiids and from 1.04 to 2.51 x 10 to the 4th power/d for copepods. Knowing levels of Sigma DDT present in planktonic crustaceans in nature, back calculations suggest that there must be << 0.1 ng Sigma DDT/L in seawater. A considerable amount of the Sigma DDT reported in seawater must therefore be unavailable to plankters because it is 'bound' to particles. (Katz-EIS)

CADMIUM SORPTION IN ESTUARINE MUD-TYPE SEDIMENT AND THE ACCUMULATION OF CADMIUM IN THE SOFT-SHELL CLAM, MYA ARENARIA,
District of Columbia Univ., Washington. Mount Vernon Square Campus.
H. L. Phelps.
Estuaries, Vol. 2, No. 1, p 40-44, 1979. 3 fig, 3 tab, 22 ref.

Descriptors: *Cadmium, *Cadmium radioisotopes, *Clams, *Bottom sediments, *Mya, *Tissue analysis, *Bioaccumulation, Humic acids, Bentonite, Absorption, Metals, Path of pollutants, Estuaries, Chemical analysis, Bioassay, Proteins, Animal physiology, Chesapeake Bay.

Young Mya arenaria were exposed to cadmium-109 sorbed to humic acid, bentonite, protein (albumin), mud-type sediment and filtered estuarine water in a 24-hour static assay. After 3 1/2 hours, shells had sorbed twice as much cadmium as tissues. Cadmium-109 was linearly accumulated over 24 hours by Mya exposed to cadmium in estuarine water and bentonite-sorbed cadmium. Protein(albumin)-sorbed cadmium was not accumulated by Mya. Final 24-hour average accumulation levels of sorbed cadmium compared to cadmium in estuarine water were: bentonite-cadmium, 100%; humic acid-cadmium, 60%; mud sediment-cadmium, 33%; albumin-cadmium, 12%. HYPOTHERMAL MORTALITY IN MARINE FISHES OF SOUTH-CENTRAL FLORIDA JANUARY, 1977,
Harbor Branch Foundation, Inc., Fort Pierce, FL.
R. G. Gilmore, L. H. Bullock, and F. H. Berry.
Northeast Gulf Science, Vol. 2, No. 2, p 77-97, 1978. 4 fig, 3 tab, 51 ref.

Descriptors: *Fishkill, *Cold resistance, *Water temperature, *Hypothermia, Tampa Bay, Indian River, Sanibel Island, Thermal stress, Mortality, Fish physiology, Marine fish, Growth stages, Air temperature, Weather, Fronts(Atmospheric), Florida, Tropical fish.

Comparable climatic conditions on both coasts of central Florida resulted in cold induced fish mortalities from 19 January to 13 February 1977. Lethal temperatures, the species killed and their relative numbers killed are compared for the Indian River lagoon, Tampa Bay and Sanibel Island estuarine systems. Fifty-six species were killed in the Indian River area, 36 in the Tampa Bay area, while 19 died at Sanibel Island. The higher species mortality in the Indian River lagoon may be attributed to local hydrological and topographical conditions and a richer ichthyofauna. Cold-induced mortality was noted in both juvenile and adult tropical fishes. Some tropical species appear to be more eurythermic than others as lethal minimum temperatures ranged from 6 to 13 C. Hypothermal stress and mortality were observed in offshore reef fishes. (Deal-EIS)

PLANKTON OF THE HOOGHLY ESTUARY WITH SPECIAL REFERENCE TO SALINITY AND TEMPERATURE,
Central Inland Fisheries Research Inst., Barrackpore (India).
S. B. Saha, B. B. Ghosh, and V. Gopalakrishnan.
Journal of the Marine Biological Association of India, Vol. 17, No. 1, p 107-120, 1975. 6 fig, 6 tab, 6 ref.

Descriptors: *Phytoplankton, *Zooplankton, *Salinity, *Water temperature, Plankton, Diatoms, Seasonal, Rivers, Estuarine environment, Copepods, Commercial fishing, Cyanophyta, Chlorophyta, Monsoons, Rotifers, India, Hooghly Estuary, Hooghly River, Matlah River.

The results of investigations conducted on the plankton fluctuations in the Hooghly-Matlah estuarine system are presented. The upper zones of rivers Hooghly and Matlah have been found to be rich in phytoplankton. Taking the entire estuarine system, generally two peaks of phytoplankton abundance, with yearly variations in their magnitude are observed, the diatoms playing the most important part in determining the pattern of seasonal variations. Among the zooplankters, copepods form the dominant group. Two annual peaks of abundance have also been observed in the case of zooplankton abundance. The surface water temperature of the estuarine system varied between 19.0C and 32.5C, with the annual range of variation between 7.7C and 12.08C. The salinity varied from traces to 32.77% in different zones. Information so far gathered on the plankton in this major estuarine system, in relation to salinity and temperature fluctuations, is reviewed and discussed, with special reference to the fisheries potential of the area. SURVIVAL OF EUGLENA GRACILIS EXPOSED TO SUBLETHAL TEMPERATURE AND HEXAVALENT CHROMIUM,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
W. H. Yongue, Jr., B. L. Berrent, and J. Cairns, Jr.
Journal of Protozoology, Vol. 26, No. 1, p 122-125, 1979. 4 fig, 3 tab, 12 ref.

Descriptors: *Chromium, *Toxicity, *Water pollution sources, *Temperature, *Lethal limit, *Euglena, Microorganisms, Laboratory tests, Heat resistance, Thermal stress, Water quality.

The joint effects of exposure to various concentrations of chromium trioxide and to sublethal temperature were examined on Euglena gracilis. The

experiments were performed to determine the highest temperature at which the organisms survive for three hours, the highest concentration of chromium trioxide at which most of these organisms survive for three hours, and the combined effects of the determined temperature and chromium concentration on the organisms. Chromium trioxide with hexavalent chromium appears relatively stable in water, but is more toxic than other chromium oxides due to its odixizing potential and ease of penetration of biological membranes. The concentration of hexavalent chromium has been limited by the Water Quality Act of 1965 to five ppm or less in waters discharged into municipal sewage; the allowable concentration standard for drinking water is less than 0.05 ppm. Most Euglena gracilis survived a three hour exposure to a concentration of 1 mg/liter of chromium trioxide at room temperature, or 20C. When the flagellate were kept for one hour at 31.5C and exposed to chromium at room temperature they were as sensitive to 0.001 mg/liter as to 10 mg/liter. Simultaneous exposure to 31.5 plus or minus 0.5C and chromium concentrations down to 0.001 mg/liter resulted in less than 50% Euglena survival at the end of three hours. The most important results were the lasting effect of sublethal temperature and the lethal effect of chromium at concentrations lower than the 0.05 mg/liter legal standard for drinking water. Available from the National Technical Information Service, Springfield, VA 22161 as PB-296 504, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA-600/3-78-085, September 1978. 117 p, 4 tab, 11 ref, 1 append.

Descriptors: *Aquatic microbiology, *Phytoplankton, *Lakes, *Eutrophication, Outlets, Sewers, Environmental effects, Water quality, Florida, Water pollution effects, Distribution, Sampling, Nygaard's trophic indices, Palmer's organic pollution indices.

The species and abundance of phytoplankton in 40 lakes were sampled by the National Eutrophication Survey in Florida to ascertain the relationships between algal characteristics and trophic status of individual lakes. The lake selection criteria included: (1) lakes impacted by one or more municipal sewage treatment plant outfalls; (2) lakes of 40 hectares in size or larger; and (3) a mean hydraulic retention time of at least 30 days. Sampling sites were selected on the basis of available information on lake morphometry, potential major sources of nutrient input, and on-site judgement of the field limnologist. Results include the calculation of Nygarrd's Trophic State Index, Palmers Organic Pollution and species diversity and abundance indices. The computer generated appendix contains alphabetical phytoplankton lists, and also lists taxa without species names. (Davison-IPA)

In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry,' Texas University Marine Science Institute, Supplemental Reports to Contract AA550-CT6-17, to the Bureau of Land Management, p 1-1 -1-82, 1979. 14 fig, 4 tab, 6 ref, append. AA550-CT6-17.

Descriptors: *Texas, Benthos, *Sediments, *Silting, *Sites, Water pollution effects, Drilling, Resources development, Baseline studies, *Outer Continental Shelf, *Foraminifera, Benthonic foraminifera, Bolivina lowmani, Ammonia beccarii, South Texas Outer Continental Shelf(STOCS).

The South Texas Outer Continental Shelf was sampled for living benthonic foraminiferans at 12 stations during three seasons in 1975. During 1976, 29 stations were sampled during three seasons and 10 of these stations were sampled during six monthly cruises. These samples were processed and living benthonic foraminiferans were picked, counted, identified and the data evaluated via cluster analysis and maps of density, diversity and richness. The significant findings include: the division of benthonic foraminiferans into groups or individuals characteristic of such features as nearshore-offshore, seasonality, regions of the shelf such as the modern mud blanket, etc. Findings that may prove useful for site evaluation or monitoring include: the use of Bolivina lowmani as a indicator of silting and bottom current movement, the use of Ammonia beccarii and other species to indicate perturbations in the water column and sediments, and the suggestion that the bank stations may represent a region very susceptible to man's activities. DETERMINATION OF AVERAGE DRY WEIGHTS OF IMPORTANT NEUSTON SPECIES COLLECTED IN 1976,
Texas A and M Univ., College Station.
J. H. Wormuth.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry,' Texas University Marine Science Institute, Supplemental Reports to Contract AA550-CT6-17, to the Bureau of Land Management, p 3-1 - 3-37, 1979. 15 fig, 6 tab, 2 ref. AA550-CT6-17.

Descriptors: *Texas, *Ecology, *Plankton, *Biota, *Temporal distribution, *Spatial distribution, Baseline studies, Resources development, Water pollution effects, *Outer Continental Shelf, Diversity index, Species composition.

Dry weights per individual of a number of neuston taxa, considered to be ecologically important, were determined and then used in conjunction with the actual concentrations to give estimates of dry weights of the 1976 winter through April samples. In addition, analyses of variance were run to look at diel, seasonal and spatial variability; factor analysis was used to look at species groupings; comparisons of neuston and zooplankton data were made; and plots of seasonal variation of selected species means along Transect II were made. Groups of species which respond to the environment in similar ways are defined. The relationships of these groups to other parameters are not apparent in the 1976 data, but most of the other parameters were measured on different cruises than those on which the neuston samples were collected. BUREAU OF LAND MANAGEMENT SOUTH TEXAS OUTER CONTINENTAL SHELF REPORT OF CONSULTANCY ON BENTHIC ECOLOGY PROGRAMME - 22 AUGUST - 11 SEPTEMBER AND 24 OCTOBER - 5 NOVEMBER,
Marine Lab., Aberdeen (Scotland).
A. D. McIntyre.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry,' Texas University Marine Science Institute, Supplemental Reports to Contract AA550-CT6-17, to the Bureau of Land Management, p 5-17 - 5-38, 1979. AA550-CT6-17.

Descriptors: *Texas, *Benthos, *Ecology, *Water pollution effects, Baseline studies, Environmental effects, Leases, Oil pollution, Monitoring, *Outer Continental Shelf, Petroleum development, South Texas Outer Continental Shelf(STOCS).

Work done to date in the benthos ecology programme is reviewed, giving particular attention to an evaluation of data collected during the first three years, and examining possible future developments. The aims are to achieve an understanding of how to assess and control the impact of petroleum exploitation and development in the STOCS area, and in particular to protect the living marine resources from deleterious effects, the overall aim being the general management of the OCS leasing programme. The research considered falls mainly into two parts - in general surveys of first the macrobenthic infauna and second the epifauna, but two related programmes, on regions of topographic highs and on the monitoring of drilling rig effects, are also included. In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry,' Texas University Marine Science Institute, Supplemental Reports to Contract AA550-CT6-17, to the Bureau of Land Management, p 6-1 - 6-28, 1979. 18 fig, 1

tab. AA550-CL6-17.

Descriptors: *Texas, *Invertebrates, *Benthos, *Ecology, Baseline studies, Water pollution effects, Environmental effects, Resources development, *Outer Continental Shelf, *Population density, Spatial variation, Temporal variation, South Texas Outer Continental Shelf(STOCS).

Benthic invertebrate data from the STOCS were examined for spatial and temporal variation in abundance. Species which were characteristic of station groups and which showed strong variation in population density were studied. Samples collected in 1976 were retrieved and individuals sexed and measured. Length-frequency histograms of all species measured are presented. Variations in epifaunal abundance due to recruitment of young size classes into the study area were verified. Infaunal data analysis did not show seasonal peaks of reproduction possibly because generation time of infaunal organisms is short. Simple linear regressions of mean length of an epifaunal species against physical variables revealed significant correlations with depth, salinity and grain size parameters. Preliminary examination of non-linear, multi-variate analysis shows it to be a useful tool for explaining the distribution of a species. (Sinha-OEIS)

BIOMASS MEASUREMENTS OF BENTHIC INVERTEBRATES,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
J. S. Holland, J. Holt, P. J. Cotter, P. B. McDonald, and S. McBride.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry,' Texas University Marine Science Institute, Supplemental Reports to Contract AA550-CT6-17, to the Bureau of Land Management, p 7-1 - 7-23, 1979. 8 tab, 7 ref. AA550-CT6-17.

Descriptors: *Texas, *Biomass, *Benthos, *Invertebrates, Baseline studies, Water pollution effects, Resources development, Environmental effects, *Outer Continental Shelf, Petroleum development, Biomass distribution, South Texas Outer Continental Shelf(STOCS).

Biomass, measures as wet weight, of 19 epifaunal species and 14 infaunal species for nine monthly and seasonal collections during 1976, was assayed. Distribution of biomass spatially and temporally was analyzed and regression of biomass on numbers of individual by species was obtained. Total sample biomass was distributed according to depth for both epifauna and infaunal organisms. Infauna exhibited a gradient in total biomass inversely proportioned to depth. Epifaunal biomass decreased precipitously in the deepest of the zones while remaining essentially the same in the two shallow zones. Analysis of variance on raw biomass and standing crop data showed no significant differences in total biomass with season or with transect. Biomass of individual species showed several interesting patterns. Infaunal species were either basically shallow-water species grading into deeper zones or the reverse. Epifaunal species exhibited several other biomass distribution patterns including apparent mid-depth species which exhibited decreased biomass in both shallower and deeper zones. Mean collection biomass exhibited possible recruitment periods for a limited number of species, with no significant pattern for most. (Sinha-OEIS)

ADDENDUM TO HISTOPATHOLOGY OF DEMERSAL FISHES. HISTOPATHOLOGY OF MICROPOGON UNDULATUS (ATLANTIC CROAKER) EXPOSED TO WATER SOLUBLE FRACTIONS OF SOUTH LOUISIANA CRUDE OIL,
Texas A and M Univ., College Station. Dept. of Veterinary Anatomy.
W. E. Haensly, and J. C. Eurell.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry,' Texas University Marine Science Institute, Supplemental Reports to Contract AA550-CT6-17, to the Bureau of Land Management, p 8-1 - 8-10, 1979. 2 tab, 4 ref.

Descriptors: *Texas, *Pathology, *Fishes, *Water pollution effects, Baseline studies, Environmental effects, Resources development, *Outer Continental Shelf, *Crude oil, Demersal fishes, Atlantic croaker, Micropogon undulatus, South Texas Outer Continental Shelf(STOCS).

Histopathologic analyses of approximately 100 Micropogon undulatus (Atlantic croaker) exposed to water soluble fractions of South Louisiana crude oil were made. Five fish were exposed to two solutions (5 and 10% of a stock solution) for 1, 3, 7, 14 and 21 days. Samples of liver, kidney, heart, skeletal muscle, stomach, gonad and gill were collected following the various periods of exposure. Most of the organ samples obtained from fish exposed to varying concentrations of water soluble fractions of South Louisiana crude oil did not show lesions that could be attributed to the oil. Two of the organs, gill epithelium and liver, and possibly a third organ, the subcutaneous areas, did show a response to the crude oil. The fact that some organs did not demonstrate a response and that others showed a minimal response suggests that the lengths of exposure, the concentrations used, or both exposure and concentrations, were too low to permit severe lesions to occur. J. K. Winters.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry,' Texas University Marine Science Institute, Supplemental Reports to Contract AA550-CT6-17, to the Bureau of Land Management, p 12-1 - 12-77, 1979. 20 fig, 29 tab, 4 ref. CC550-CT6-17.

Descriptors: *Texas, *Oil spills, *Aromatic compounds, Water pollution effects, Resources development, Environmental effects, Baseline studies, *Outer Continental Shelf, *Petroleum development, Alkanes, South Texas Outer Continental Shelf(STOCS).

Two simulated oil spills (300 and 100 PPM) were conducted in 7000 liter outdoor tanks. A mixture of aromatic compounds was added to a tank in a third experiment. Dissolved and particulate fractions of seawater were analyzed by gas chromatography and combined gas chromatography-mass spectrometry. Results showed that the concentration of petroleum derived alkanes was approximately ten times greater in particulate fractions. Aromatics were generally at least five times more concentrated in dissolved fractions. Aromatic compounds were partitioned between dissolved and particulate fractions with parent and mono-methyl compounds enriched in dissolved fractions while more highly methylated compounds were enriched in particulate fractions. BIOLOGICAL CHARACTERIZATION OF THE NEPHELOID LAYER,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
D. Kamykowski, J. Batterton, J. Bird, R. Jordan, and S. Milton.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry,' Texas University Marine Science Institute, Supplemental Reports to Contract AA550-CT6-7, to the Bureau of Land Management, p 15-1 - 15-86, 1979. 29 fig, 15 ref, 3 append. CC550-CT6-17.

Descriptors: *Texas, *Phytoplankton, *Biomass, *Water pollution effects, Oil pollution, Baseline studies, Resources development, Environmental effects, *Outer Continental Shelf, *Nepheloid layer, Species composition, Petroleum development, South Texas Outer Continental Shelf(STOCS).

A single station (near STOCS 4/II) was sampled for 24 hour periods on 29-30 June, 24-25 July, 25-26 September and 8-9 November 1978. Samples surveyed turbidity, light transmission, temperature, salinity, plant nutrients, plant biomass, species abundances, and near bottom 14C uptake. A variable nepheloid layer was encountered during each cruise; only the first two cruises had associated phytoplankton abundances. These phytoplankton accumulations were composed of both pelagic and benthic species. Net 14C uptake was detected within these layers under in situ conditions. Evidence suggests that this layer may be especially vulnerable to energy related activities. It is speculated that oil introduced into the near bottom layer probably will affect the species composition and net production of the phytoplankton community either through direct toxicity or through detrimental effects on light conditions, nutrient conditions or grazers. The ecosystem impact of changes in this phytoplankton reservoir will depend on the alternate choices available to grazers. (Sinha-OEIS)

FEDERAL ROLE IN OCS OIL AND GAS DEVELOPMENT.
Office of Technology Assessment, Washington, DC.
Staff Paper, May 1977. 22 p.

Descriptors: *Leases, *Resources development, *Federal government, *Baseline studies, Pollution abatement, Environmental effects, Water pollution effects, Oil pollution, United States, *Outer Continental Shelf, Petroleum development.

The numerous Federal Government related activities which make up the entire OCS leasing and regulating process are set forth as well as estimates for each step. One chart provides an overview of the process in its entirety. Detailed charts describing the process step-by-step are also provided. Finally a bar chart is provided to show the amount of time required by both Government and industry to proceed through the various stages of the OCS oil and gas development process. Separate 'timelines' are provided for both established and frontier areas. Baseline studies are conducted in frontier areas to establish an environmental benchmark to permit continued monitoring after the sale during drilling and production to detect possible adverse effects from these operations. If such adverse effects are detected, additional regulations would be adopted to reduce or eliminate them. Studies cover data on geology, geophysics, biological environment, oceanography and meteorology associated with a particular region where offshore leasing may take place. These studies include original research as well as an analysis of existing information. (Sinha-OEIS)

STUDY DESIGN FOR RESOURCE MANAGEMENT DECISIONS: OCS OIL AND GAS DEVELOPMENT AND THE ENVIRONMENT.
Bureau of Land Management, Washington, DC.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $0.00. Stock No. 024-011-00100-0. October 1978. 111 p, 3 fig, 4 tab, 10 ref, 10 append.

Descriptors: *United States, *Resources development, *Water pollution effects, *Environmental effects, Pollution abatement, Gases, Oil spills, Water resources, Planning, Decision making, *Outer Continental Shelf, Petroleum development, Resources management.

This document is an updated statement of the program design for the Bureau of Land Management's (BLM) Outer Continental Shelf (OCS) Environmental Studies Program. The analyses contained in this document are useful for delineating information needs and for establishing program direction, but these are only examples and are not intended to be exhaustive. Chapters three and four and a number of the appendices show a few of the ways in which public issues for a given OCS area can be determined and used to define studies that can provide timely and useful information to the decisionmaker. It is hoped that this document represents a clear statement of the structure and function of the OCS environmental studies program as it exists now, and provides a framework in which changes can be readily accommodated on a regular basis. A glossary of terminology has been provided. (Sinha-OEIS)

THE MICROFOULING PROBLEM AND THE FUTURE OF THE OCEAN THERMAL ENERGY CONVERSION (OTEC) PROGRAM,
Columbia Univ., New York. Dept. of Biological Sciences.
W. A. Corpe.
Marine Technology Society Journal, Vol. 13, No. 1, p 21-25, February-March, 1979. 1 tab, 25 ref.

Descriptors: *Resources development, *Energy conversion, *Fouling, *Sea water, Heat exchangers, Films, Slime, Environmental effects, Water pollution, Electric power, Water pollution effects, *Outer Continental Shelf, *Ocean Thermal Energy Conversion(OTEC).

The Ocean Thermal Energy Conversion (OTEC) concept is looked upon as a potentially important, renewable source of electric power for the future, deserving of study and possible development. The temperature difference between warm surface water and cold deep water at most suitable tropical or subtropical oceanic sites is only about 20 degrees K, so the thermal resistance between seawater and working fluid must be as low as possible so as not to compromise the technical viability of the system. Microfouling in the form of a 'slime layer' invariably develops on all solid surfaces exposed to seawater. Such films significantly affect the performance of heat exchanges by acting as insulators. Some aspects of marine microfouling are discussed and some views are presented about (a) what kind of research effort in microfouling must be undertaken if progress in OTEC development is ultimately to be realized, and (b) what considerations ought to be taken into account when establishing research priorities. (Sinha-OEIS)

OCS DEVELOPMENT AND COMMERCIAL AND RECREATIONAL FISHING,
Resources for the Future, Inc., Washington, DC.
E. A. Wilman.
Coastal Zone Management Journal, Vol. 5, No. 3, p 211-230, 1979.

Descriptors: *Resources development, *Fisheries, *Oil spills, *Leases, Environmental effects, Water pollution effects, Fishing grounds, Economics, *Outer Continental Shelf, Petroleum development, Commercial fisheries, Recreational fisheries.

As the controversy over Outer Continental Shelf (OCS) oil and gas leasing continues, with environmentalists and fishermen seeking to block or delay leasing decisions that they think will adversely affect their interests, the need for better estimates of the environmental costs associated with OCS development becomes increasingly apparent. Although high degrees of precision in such estimates may never be economic, let alone feasible, better knowledge would reduce the uncertainty surrounding the magnitude of such costs, and would make it easier to come to grips with the problem and reduce, if not resolve, the controversy. BENTHIC MACROINVERTEBRATES OF THE FRESHWATER POTOMAC,
Maryland Dept. of Natural Resources, Annapolis. Water Resources Administration.
G. H. Harmon.
Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2. In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 29-35, 2 fig, 1 tab, 28 ref.

Descriptors: *Benthic fauna, *Invertebrates, *Aquatic animals, *Potomac River Basin, *Water quality, *Bioindicators, *Water pollution, Water pollution sources, Acid mine water, Sampling, Monitoring, Ecology.

Potomac River benthic invertebrates are sampled in a program conducted by the Maryland Water Resources Administration to provide information applicable to the assessment of trends in water quality. As part of the Baseline Water Quality Monitoring Network (BWQMN) established by the Interstate Commission on the Potomac River Basin, the statewide program consists of 15 sampling locations. Results are reported for each of the 10 mainstream stations above Washington which have been sampled at least once during the past three years. These results show that the benthic macroinvertebrate communities of the Upper North Branch of the Potomac River are impoverished, indicating severely degraded water quality primarily caused by acid mine wastes. The nea annihilation of the aquatic communities including fish and most aquatic plants, in addition to the macroinvertebrates, is attributed to the acid mine waters. At Paw Paw and Hancock good-to-excellent water quality is indicated by the diverse benthic communities. A downward trend in water quality and benthic community diversity in the Shepherdstown to Little Falls region is attributed to point discharges and nonpoint runoff. The

impact of the environmental stresses created by man and nature in the basin is generally reflected by the macroinvertebrate communities. Approximately 200 macroinvertebrate species have been identified in the freshwater Potomac. (Davison-IPA)

BENTHIC MACROINVERTEBRATES OF THE SHENANDOAH BASIN,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies.
H. H. Seagle, Jr., and A. C. Hendricks.
Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 36-43, 5 fig, 2 tab, 22 ref.

Descriptors: *Benthos, *Invertebrates, *Bioindicators, *Environmental effects, Systematics, Aquatic insects, Shenandoah River basin.

Semi-quantitative samples of benthic macroinvertebrates were taken at four stations in the Shenandoah basin to determine the meaningful attributes of the biotic community which could be used as indicators of environmental changes. A total of 191 taxa representing 78 families and six phyla of macroinvertebrates have been collected in the basin. The most diverse, the phylum Arthropoda, represented 84.2% of the taxa. The aquatic insect orders Trichoptera, Coleoptera, Ephemeroptera, and Diptera were the most abundant organisms. Of the four genera of aquatic moths reported, only Paragyractis is believed to actually occur in the basin. The four organisms being reported from Virginia for the first time are Ephemera varia, Ephoron leukon, Potamanthus myops, and P. Walkeri. (Davison-IPA)

FISHES OF THE APPALACHIAN REGION OF MARYLAND,
Maryland Dept. of Natural Resources, Cumberland. Regional Service Center.
R. M. Davis.
Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 59-65, 1 fig, 2 tab, 19 ref.

Descriptors: *Fish populations, *Appalachian Mountain Region(Maryland), *Acid mine water, Potomac River, Tributaries, Drainage patterns, Water pollution effects, Water quality, Fish migration, Fish establishment, Aquatic habitats, Aquatic environment.

Fish populations of the Potomac River are discussed for the portion of the river from its headwaters near Kempton, Maryland, to Hancock, Maryland, and associated Potomac River tributaries. Acid mine drainage adversely affects the water quality in this region of Maryland, and in turn affects the fish populations of the Potomac River. Because it is extremely toxic to all forms of aquatic life, acid mine drainage, left undiluted, may destroy biological activity for many miles downstream from its discharge point. Past and current studies concerning the Potomac River water quality are cited. Fish samples were taken from seven stations on the North Branch, Potomac River, from three stations on the Potomac River Main Stem, and from 35 tributary stations. No fish were found at the three uppermost stations on the North Branch and 14 tributary stations due to heavy acid mine drainage. Water quality is extremely poor from Kempton to Luke, and remains poor from Luke to McCoole where three species of minnows were collected. Just upstream from Cumberland seven species of fish were collected, indicating some improvement of water quality. Gradual improvement of water quality was noted from Cumberland to Little Orleans, Maryland; the slight deterioration at Hancock was due to local waste water discharge. Water quality was sufficiently improved at Westernport and Keyser to allow 22 species of fish to become established. A total of 42 different species of fishes were collected at the various stations. Only three to nine species of fish occur where streams receive intermittent-to-small amounts of acid mine drainage; streams with no acid mine drainage had three to 24 species in more abundant populations. (Davison-IPA)

FISHERY RESOURCES OF THE SHENANDOAH VALLEY,
Virginia Commission of Game and Inland Fisheries, Charlottesville.
J. Kauffman.
Interstate Commission on the Potomac River Basin, Rockville, MD. Technical Publication 78-2.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 66-69, 5 fig, 1 tab, 8 ref.

Descriptors: *Fisheries, *Fish populations, *Fish establishment, *Aquatic habitats, *Aquatic life, *Aquatic environment, Water pollution effects, Fish food organisms, Water quality, Phosphate, Nitrate, Phytoplankton, Agricultural runoff, Creel census, Shenandoah River(Virginia).

The Shenandoah is the most heavily fished stream in Virginia, and has an estimated economic expenditure value of 2,718/hectare a year. Creel surveys conducted on the South Fork of the Shenandoah from 1964 to 1968 and from 1973 to 1975 showed a decline in catches of channel catfish, panfish, and largemouth bass; smallmouth bass and rock bass catches remained stable. Increased nutrient loads resulting from changed land use practices have caused the aquatic plant community to change from a macrophyte to a phytoplankton food chain. This may have caused a change from a smallmouth to largemouth bass community in intermediate habitats. The increased human populations, industry, and agricultural production which resulted in environmental changes are reflected in changes in the Shenandoah River fishery. (Davison-IPA)

THE FISHERY OF THE PIEDMONT POTOMAC,
Maryland Dept. of Natural Resources, Annapolis. Water Resources Administration.
A. Dietemann, and A. Sanderson, Jr.
Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 70-75, 3 fig, 1 tab, 32 ref.

Descriptors: *Fisheries, *Fish management, *Fish populations, *Fish conservation, *Fish establishment, *Spawning, Fish passages, Anadromous fish, Ecology, Aquatic habitats, Aquatic environment, Water quality control, Water utilization, Water pollution, Water pollution effects, Potomac River(Maryland).

Although the fishery of the Piedmont Potomac has declined during the past 10 years, the River and its tributaries from the Monocacy to below Little Falls still support a fair resident fishery; there is great spawning potential for anadromous fish in the river below Little Falls. Overfishing, lack of effective fish passages at water supply intakes, flow reduction caused by increased withdrawals, sediment pollution, and stormwater containing contaminants are all probable factors contributing to the decline. A total of 63 fish species are reported for this area of the Potomac River, and of these, four not reported for several years may be extirpated from the Piedmont Potomac. Limiting water supply withdrawals and problems of water quality control associated with urbanization and agricultural runoff are examined. It is concluded that fish life in the Piedmont Potomac is still a diverse and admirable resource. Specific suggestions are made for the protection and enhancement of this resource. (Davison-IPA)

Descriptors: *Water pollution effects, *Aquatic insects, *Aquatic habitats, *Aquatic environment, Electric generators, Environmental effects, Thermal pollution, Sediments, Deposition(Sediments), River flow, Turbidity, Silting, Potomac River(Maryland), Monocacy River(Maryland), Whites Ferry(Maryland), Point of Rocks(Maryland).

The Potomac River was surveyed at four stations from Point of Rocks to Whites Ferry from 1956 to 1972. The stations are located above and below the Potomac Electric Power Company (Pepco) generating plant which is situated at the confluence of the Potomac and Monocacy Rivers. Station 2, the first below the plant, is split with the left bank (2L) receiving the heated plant effluent; the right bank (2R) is free of heated water, except under very unusual flow conditions. High-water flow dilutes the heated effluent and also concentrates and holds the silt from the Monocacy along the left bank. Station 2L and the left channel of station 3 monitor the effects of silt form urbanization and agriulture which flow from the Monocacy into the Potomac. The fluctuations in the total insect fauna at each station are charted with the starting dates of operation for the different Pepco generating units. Species number declined at stations 1, 2L and 3 when unit 1 started up. When units 2 and 3 became operational no disturbances were noted. At the beginning of the survey in 1975, a range of 54 to 104 species of insects were noted; by 1975 these numbers declined to a range of 47 to 76 species. This decline in the insect fauna is attributed to increased nonpoint discharges. Fluctuations are charted for the following insect families found in this study: Gomphidae (Odonata: Anisoptera), Heptageniidae (Ephemeroptera), Perlidae (Plecoptera), Elimidae (Coleoptera), and Hydrosychidae (Trichoptera). THE CHANGING MOLLUSCAN COMMUNITY,
Academy of Natural Sciences of Philadelphia, PA. Div. of Limnology and Ecology.
S. Fuller.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 124-131, 1 tab, 62 ref.

Descriptors: *Water pollution effects, *Mollusks, *Thermal pollution, *Sedimentation, *Animal populations, Ecosystems, Ecological distribution, Aquatic invertebrates, Benthic fauna, Mussels, Effluents, Gastropods, Snails, Toxins, Potomac River, Montgomery County(Maryland).

An environmental survey of the middle Potomac River was conducted from 1956 to 1976 on behalf of the Potomac Electric Power Company (Pepco) and its steam electric station at Dickerson, Montgomery County, Maryland. Mollusks were selected for study because they are a predominant element of the fresh-water macrobenthos, and are widely adaptable to environmental changes. In addition to studying the changes in the mollusk population, the effects of thermal effluents on these invertebrates were examined. Information concerning the numbers of animals present, the location and state of the environment, symbiosis, and condition of the animal is presented for numerous bivalves and gastropods. The severe decline of these populations over the years is attributed to sedimen-

ation, heightened water temperature, symbiotic elationships, and toxins. Significant changes ocurred in 1967 or 1968, and most of the affected nollusks were extirpated or their populations were liminished below recruitment level. At present the nadequate environmental conditions persisting consist of sedimentation, adverse water temperaure, the onslaught of exotic organisms, and the ffects of toxic pollutants. Thermal effects are local nd no longer affect the composition of the comnunity which has been reduced to a core of speies notoriously tolerant of environmental disturbances. (Davison-IPA)

EFFECTS OF THERMAL DISCHARGES ON FRESHWATER FISHES,
Ichthyological Associates, Inc., Middletown, DE. Experimental Studies.
J. W. Meldrin, and S. Peterson.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 132-136, 5 fig, 32 ref. Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2.

Descriptors: *Water pollution effects, *Thermal pollution, *Fresh water fish, *Water temperature, *Environmental effects, Entrainment, Thermal powerplants, Ecology, Fish management, Fish behavior, Fish physiology, Aquatic environment.

The use of water by steam electric power generating stations to cool their condensers results in a thermal discharge, the effects of which vary with the type of fish and how that species exploits the environment of that site. The degree of ecological significance of a particular effect is site-specific, and must be evaluated consistant with the ecological potential of the water body. Results of laboratory experiments show that fish have preferred temperatures, i.e., they will avoid temperatures too high or too low. This response varies with the season, species, ambient temperature of the receiving water, and the temperature of the thermal discharge. Light level size also influence avoidance temperature and preferred temperature. Fish seem to prefer thermal plume during the colder months. Crowding resulted in an increased incidence of disease, starvation, and poor condition in some species, but not others. Sudden temperature decreases are of more concern than upped lethal temperatures which will be avoided. Mortalities can occur during the colder seasons if the thermal discharge stops, or if the plume temperatures drop below the temperature tolerance of the species. The effects of secondary (or plume) entrainment on fish eggs and prolarvae are small compared to the other effects. (Davison-IPA)

IMPACT OF WASTEWATER TREATMENT PLANT DISCHARGES,
Maryland Univ., College Park. Inland Environmental Lab.
C-f. Tsai.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 147-150, 5 fig, 33 ref.

Descriptors: *Sewage effluents, *Environmental effects, *Water pollution effects, Ecosystems, *Aquatic habitats, Fish behavior, Spawning, Benthos, Waste treatment, Water pollution sources, Waste disposal, Sewers, Outfalls, Treatment facilities, Water quality control, Water pollution treatment, Chlorination, Nitrates, Phosphates, Eutrophication.

Chemical composition of sewage treatment plant effluents varies from plant to plant, depending on the sources of sewage, the degree of treatment, and the chemicals added during treatment. The impact of these effluents differs from one receiving stream to another, according to the quality and quantity of the effluent, and the physical and chemical condition of the stream. Sewage effluents often toxic, damage aquatic life through direct toxication. The sludges contained in these effluents are also damaging in that turbidity is increased, fish may receive abrasive injuries and clogged gills, bottom organisms are reduced and modified, and spawning grounds are destroyed. Phosphates and nitrates, the organic nutrients in sewage effluents, increase primary productivity and are beneficial in amounts which can be assimilated into the food chain. Excessive amounts of the nutrients result in water deoxygenation, algal bloom, growth of molds and bacteria, and eutrophication. Events occurring when improperly treated or raw sewage is discharged to a receiving stream are summarized; the effects of proper and improper chlorination are discussed; four types of plants are described; and four types of sewage outfall locations are examined. Because they contain two major resources, water and nutrients, sewage effluents can be reclaimed by crop irrigation, and used as fertilizer, soil conditioners, and compost. It is concluded that the impact of sewage effluents can be damaging or beneficial, depending on the type of sewage produced, how it is treated, and the manner of its disposal. (Davison-IPA)

5D. Waste Treatment Processes

AEROBIC DIGESTION OF WASTE ACTIVATED SLUDGE,
Alley (E. Roberts) and Associates, Brentwood, TN.
C. S. Reece, R. E. Roper, Jr., and C. P. L. Grady, Jr.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers. Vol. 105, No. EE2. p 261-272, April 1979. 5 fig, 3 tab, 20 ref, 2 append. OWRT A-033-IND (5).

Descriptors: *Activated sludge, *Aerobic treatment, Sludge, Sludge digestion, Suspended solids.

Activated sludge that had been grown on a completely soluble wastewater in a pilot plant was subjected to aerobic digestion in batch, lab-scale reactors. During the course of digestion, destruction of nonvolatile solids occurred so that it was preferable to express the kinetics of digestion upon the loss of total suspended solids rather than volatile suspended solids. The first-order rate constant for the destruction of degradable suspended solids was found to be unaffected by the solids retention time (SRT) at which the activated sludge had been grown, whereas the nondegradable fraction of the activated sludge was found to increase as the SRT increased.

NITROGEN AND PHOSPHORUS REMOVAL FROM SEWAGE EFFLUENT WITH HIGH SALINITY BY CHORELLA SALINA,
Chinese Univ. of Hong Kong. Dept. of Biology.
K-Y. Chan, K. H. Wong, and P. K. Wong.
Environmental Pollution, Vol. 18, p 139-146, 1979. 3 fig, 1 tab, 34 ref.

Descriptors: *Microbial degradation, *Chlorella, *Sewage effluent, Salinity, Nitrogen, Phosphorus, Ammonia, Domestic wastes, Waste water treatment, Phosphates, Nitrates, Absorption, Chlorophyta, Secondary treatment, Nutrients, Growth rates.

Cells of Chlorella salina CU1 are able to grow well in domestic sewage effluent having salinities as high as 16 ppt. By using controlled C. salina CU1 cultures, it is possible to remove the nitrogen and phosphorus from the sewage effluent before it is discharged into marine coastal water. With a retention time of 8 days, 86% to 100% NH3-N, 98% NO3-N and 98% PO4-P are removed from the sewage effluent under laboratory conditions. It is also found that cells of C. salina CU1 prefer ammonia to nitrates as nitrogen source. Uptake of nitrates by the cells occurs only after the ammonia in the sewage effluent has been reduced to levels below 0.5 ppm. Ammonia at higher concentrations completely inhibits the nitrate uptake by the algal cells. Since cells of C. salina CU1 have a high protein content (44%), it is proposed that this unicellular green alga can be used to serve the dual function of wastewater purification and waste recycling through the production of algal protein from sewage effluent having high salinities. Descriptors: *Waste water treatment, *Evapotranspiration, *Effluents, Septic tanks, Aerobic treatment, Infiltration rates, Flow rate, Trace elements, Absorption, Methodology, Costs.

A laboratory study, mathematical models, and a literature search were employed to determine the applicability of evapotranspiration to treat on-site disposal of septic tank effluent and aerobically treated effluent. The relative fate of some trace metals within the evapotranspiration bed was determined in the laboratory. Mathematical models were employed in determining the evapotranspiration rates (outflow) and the infiltration rates (inflow) of the proposed evapotranspiration bed. A literature search related soil-groundwater parameters to the inflow-outflow rates and attempted to determine the effective life of the system. Results of the study show that evapotranspiration rates of aerobically digested water are equal to the rates for septic tank effluent; that evapotranspiration is independent of the dry plant matter produced; and the two feed solutions showed equal metal uptake rates. Life expectancy data were inconclusive. A methodology was proposed for an evapotranspiration waste water disposal bed design, but the current literature allowed only an estimate as to the range of bed sizes. It is concluded that the cost of this method is economically justifiable in certain circumstances. (Davison-IPA)

MANAGEMENT OF SMALL WASTE FLOWS.
Wisconsin Univ.-Madison.
Available from the National Technical Information

Service, Springfield, VA 22161 as PB-286 560, Price codes: A99 in paper copy, A01 in microfiche. Report EPA-600/2-78-173, 1978. 807 p, 235 fig, 251 tab, 411 ref, 5 append.

Descriptors: *On-site collections, *Domestic wastes, *Soil investigations, *Treatment, *Septic tanks, Infiltration, Clogging, Aerobic treatment, Filtration, Flow characteristics, Hydraulic conductivity, Nutrient removal, On-site tests, Waste water treatment, Wisconsin.

A seven-year research project was conducted to conceive, evaluate and develop satisfactory methods of on-site treatment and disposal of waste waters. The study included characterization of household and commercial waste waters, assessment of waste water treatment alternatives dependent or independent of soil design, management of on-site disposal systems, and institutional and regulatory control of on-site systems. Waste water characteristics and flow data were monitored at 11 rural Wisconsin homes over a period of 434 days; the quality of the waste water was monitored for 35 days at four of the sites. Four sand filters, 11 septic tanks, 11 aerobic units, and a chemical unit were evaluated at 10 field sites and in one controlled system with a waste water simulator. Soils were evaluated as a treatment and disposal medium, and for capabilities for removing bacteria, viruses, and nutrients from waste water under different loadings and soil temperatures. The infiltration rates through biologically clogged soils were calculated; methods for reducing clogging in soils were investigated. Field methods of measuring soil hydraulic conductivity were developed and results of the investigations were utilized to improve the design, installation, and operation of both conventional and alternative soil absorption systems. Institutional control strategies for on-site waste management were discussed. (Lisk-FRC)

DEMONSTRATION OF A LEACHATE TREATMENT PLANT,
Applied Technology Associates, Philadelphia, PA.
R. L. Steiner, J. E. Keenan, and A. A. Fungaroli.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 502, Price codes: A04 in paper copy, A01 in microfiche. Report, 1977. 67 p, 8 fig, 18 tab, 63 ref, 1 append.

Descriptors: *Landfills, *Leachate, *Chemical precipitation, *Activated sludge, *Neutralization, Nutrients, Linings, Lime, Waste water treatment, Municipal wastes.

Chemical-physical and biological treatment is provided in a demonstration sanitary landfill leachate treatment plant. The physical-chemical treatments include lime precipitation, sedimentation, and air stripping. These processes remove heavy metals, ammonia, and organic materials; neutralization and nutrient supplement with sulfuric acid and phosphoric acid, respectively, enhanced the subsequent biological treatment. Activated sludge is used in the biological treatment. Processing of the leachate from a lined landfill permits discharge of the effluent into the Delaware River. (Lisk-FRC)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 842, Price codes: A03 in paper copy, A01 in microfiche. Report, 1977. 33 p, 19 fig, 4 tab, 1 append.

Descriptors: *Oil wastes, *Activated carbon, *Adsorption, *Filtration, *Polychlorinated biphenyls, Heavy metals, Settling basins, Oily water, Sludge, Treatment facilities, Waste water treatment, Industrial wastes, Florida.

An on-site treatment process was developed for six abandoned waste oil pits in Florida which contained high levels of polychlorinated biphenyls (PCB). Sampling of the ponds, which had a total surface area of about 5 acres and depths ranging from 5-15 ft, indicated they contained a bottom layer of thick oily sludge underlaying a layer of water and covered by a layer of oil. Pit pH was 1.0, permitting the PCBs to be soluble in the oil/water mixture. PCB concentrations in the sludge samples ranged 8.7-23.3 ppm and significant levels of copper, lead, zinc, cadmium, and chromium were measured. To reduce PCB levels to within 1 ppb, activated carbon was selected. Because adsorption columns were not considered practical in this instance, a powdered activated carbon adsorption system was developed which incorporated a collection sump, a carbon mixing chamber, a sedimentation basin, and a sand filter. The sump drained the pits into the mixing chamber where carbon was added at 27 ppm to the influent. The carbon-PCB sludge was then transferred to a 22,500 gal stabilization basin for at least 6.25 hrs, followed by filtration through a sand filter. The treated effluent was discharged into the St. Johns River. (Lisk-FRC)

CLOSED LOOP SYSTEM FOR THE TREATMENT OF WASTE PICKLE LIQUOR,
Crown Chemical Co., Inc., Indianapolis, IN.
J. C. Peterson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 090, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-127, 1977. 60 p, 18 fig, 12 tab, 6 ref.

Descriptors: *Acid streams, *Iron oxides, *Crystallization, *Ion exchange, *Oxidation, Hydrolysis, Recycling, Chemical wastes, Resins, Waste water treatment, Industrial wastes.

The conversion of ferrous sulfate, produced by the low temperature crystallization from sulfuric acid waste pickle liquor generated by acid-cleaning steel surfaces, to marketable ferric oxide in a closed-loop system was demonstrated. The closed-loop conversion system contains a crystallizer, an ion exchange unit, an oxidizer, and a hydrolyzer. All acids are recycled with the ferrous sulfate consumed and ferric oxide produced. In the continuous ion exchange unit, the ferrous sulfate solution is contacted with hydrogen ion exchange resin, resulting in 90% removal of ferrous ion. The system produced about 11-15% by weight sulfuric acid for recycle to the pickling process. Regeneration of the resin with 4M HNO_3 produced a ferrous-ferric nitrate solution which was subsequently heated to 180C and contacted with air for complete oxidation to the ferric phase and to oxidize NO_2 to HNO_3. Hydrolysis of this nitrate solution in a continuous coil autoclave at 205C generated ferric oxide and HNO_3. This process produced about 20% by weight HNO_3 which was recycled to the ion exchange unit. The ferric oxide was about 99% pure after drying and had an estimated market value of $0.10-0.80/kg. DEMONSTRATION OF ULTRAFILTRATION AND CARBON ADSORPTION FOR TREATMENT OF INDUSTRIAL LAUNDERING WASTEWATER,
Abcor, Inc., Wilmington, MA. Walden Div.
M. H. Kleper, R. L. Goldsmith, and A. Z. Gollan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-287 830, Price codes: A06 in paper copy, A01 in microfiche. Report EPA-600/2-78-177, 1978. 109 p, 16 fig, 26 tab, 8 ref, 3 append.

Descriptors: *Filtration, *Activated carbon, *Laundering, *Waste water treatment, *Performance, Costs, Pilot plants, Industrial wastes, Waste water.

The treatment of industrial laundering wastewaters by ultrafiltration and activated carbon adsorption was investigated. Pilot-scale testing was done at Abcor, Inc., pilot-scale testing was done at a field demonstration site, and an economic analysis was performed of full-scale treatment systems. Noncellulosic spiral-wound ultrafiltration modules were used in all experiments. A consistently high quality product water was produced. The operation of the spiral-wound ultrafiltration modules was hindered by the fouling tendency of the feed stream. Thus, average module permeate flux was low. This resulted in high capital and operating cost estimates for full-scale treatment systems. For a 100,000 gpd treatment system (assuming 14 gfd flux and 98% water recovery), operating cost was estimated to be $9.01/1000 gal. Total carbon adsorption costs of $1.07/1000 gal could be offset by credits gained from reuse of the product water within the laundry. (Small-FRC)

COMPATIBILITY OF FLOCCULATING AGENTS WITH RDX/TNT/COMP B,
Picatinny Arsenal, Dover, NJ. Feltman Research Labs.
T. C. Castorina, J. W. McCahill, and A. C. Forsyth.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A035 136, Price codes: A02 in paper copy, A01 in microfiche. Technical Memorandum 2224 1977. 14 p, 3 fig, 3 tab, 3 ref.

Descriptors: *Flocculation, *Explosives, *Polymers, *Compatibility, *Cations, Stability, Chemical reaction, Waste water treatment, Separation techniques, Industrial wastes, Military aspects.

WT2600, WT-2635, CAT-FLOC, CAT-FLOC-T, and E-653 were evaluated as flocculating agents in the treatment of ammunition waste waters containing RDX, TNT, and Comp B. The compatibility of the polymer flocculating agents with the explosives was examined with the standard Compatibility Test. The samples consisted of 2.5 g of explosive and 2.5 g of polymer, or a 50:50 5 g mixture. The samples were placed in a glass heating vial attached to a capillary tube, and the apparatus was evacuated and sealed; the vial was heated at about 100 C for 40 hrs and the volume of gas evolved was recorded. WT-2635 is a cationic homopolymer of ethenimine, WT-2600 is a cationic copolymer of dimethyldiallyl ammonium chloride and acrylamide, CAT-FLOC is a cationic homopolymer of dimethyldiallyl ammonium chloride polyelectrolyte, CAT-FLOC-T is the same as the latter but a liquid with a higher molecular weight distribution, and E-653 is an experimental sulfonated polyacrylamide powder which is hydrolytically stable under acidic conditions at high temperatures and with acidic compounds, including explosives. The results of the tests indicated E-653 was a compatible flocculating agent. (Lisk-FRC)

THE SURVIVAL OF HUMAN ENTERIC VIRUSES IN HOLDING PONDS,
Texas Univ. at San Antonio. Center for Applied Research and Technology.
B. P. Sagik, S. W. Funderburg, and B. E. Moore.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A034 387, Price codes: A03 in paper copy, A01 in microfiche. Report No. 76-1, 1976. 43 p, 16 fig, 10 tab, 17 ref.

Descriptors: *Viruses, *Ponds, *Sedimentation, *Human diseases, *Separation techniques, Deposition(Sediments), Waste water treatment, Municipal wastes.

Virus removal from municipal waste water in holding ponds has been studied in field models since 1975. Data from the investigation have indicated that the removal of human enteric viruses in holding ponds involves the components of inactivation and sedimentation. One factor identified in the inactivation process, especially for poliovirus inactivation, is higher temperatures. Laboratory investigations and differing field results in the winter and spring months indicate that this primary effect leads to more rapid inactivation. Increased biological activity due to increased sunlight and temperature have a secondary effect on virus survival. This biological activity has an antagonistic effect on the virus communities. Poliovirus appeared in the sediments generated by the holding ponds and further investigations revealed that poliovirus continued to be recovered from the sediments for a long period after they had disappeared from the overlying waters. These findings indicated that viral inactivation may include deposition of particulate-associated virions as a means of virus removal. (Lisk-FRC)

WASTEWATER CHARACTERIZATION AND PROCESS RELIABILITY FOR POTABLE WASTEWATER RECLAMATION,
Dallas Water Utilities Dept., TX.
A. C. Petrasek, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 874, Price codes: A07 in paper copy, A01 in microfiche. Report EPA-600/2-77-210, 1977. 124 p, 56 fig, 22 tab, 10 ref.

Descriptors: *Water reuse, *Potable water, *Waste water treatment, *Activated sludge, *Biological treatment, Coagulation, Lime, Carbon dioxide, Gravity, Filtration, Activated carbon, Adsorption, Tertiary treatment, Water quality, Waste quality standards, Municipal wastes.

The performance of a waste water treatment facility producing an effluent product of a quality potentially suitable for potable reuse was evaluated. The reliability of individual unit processes and the effects of process instability on the product water quality were also investigated. The municipal waste water treatment sequence involved screening, degritting, primary clarification, biological treatment with completely mixed activated sludge, lime coagulation at high pH, single-stage recarbonation with liquid carbon dioxide, gravity filtration, and two-stage activated carbon adsorption. In the pilot plant, the activated sludge influent flow rate was 152 gpm while the flow rate of the product water was 18 gpm. The collection of 24-hr composite samples was performed daily for routing analyses and weekly composite samples were utilized for metals determinations. The quality of the final product water complied in all aspects with the quality criteria of the National Primary Drinking Water Regulations. Process breakdowns or instabilities, such as in the activated sludge system and the mixed-media filter, did not impair the product water quality because of the duplication of the treatment processes. (Lisk-FRC)

TREATMENT OF PRIMARY SEWAGE EFFLUENT BY RAPID INFILTRATION,
Corps of Engineers, Waltham, MA. New England Div.
M. B. Satterwhite, B. J. Condike, and G. L. Stewart.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A035 390, Price codes: A02 in paper copy, A01 in microfiche. CRREL Report 76-49, 1976. 23 p, 11 fig, 6 tab, 22 ref.

Descriptors: *Infiltration, *Return flow, *Sewage, *Recharge ponds, *Groundwater, Biochemical oxygen demand, *Chemical oxygen demand, Coliforms, Cold regions, Nutrient removal, Phosphorus, Nitrogen, Clogging, Land management, Application methods, Rates of application, Waste water treatment, Municipal wastes.

Rapid infiltration basins were evaluated as a method of treating unchlorinated primary sewage effluent in a cool and humid climate. The untreated effluent was applied to 9 treatment basins for a period of 7 days followed by a rest period of 14 days. The basin inundations resulted in effluent additions totaling about 27 m. In groundwater samples taken from the treatment site and the surrounding area, analyses indicated that total coliform bacteria, BOD, and COD had been removed. Phosphorus concentrations in the samples were about one-third those in the applied primary effluent. In comparison with previous tests, total nitrogen additions to the treatment basins during the 7 day inundation period were 54% higher in these tests. However, groundwater nitrogen levels were comparable for both tests. When longer inundation periods were attempted in an effort to decrease nitrogen concentrations, infiltration capacities of the basins demonstrated a gradual decrease. The reduced infiltration rates were attributed to surface clogging. Proper management was considered necessary for rapid infiltration basins to maintain nitrogen removal in cold climates. (Lisk-FRC)

FEASIBILITY STUDY OF WASTE WATER RECOVERY IN SHRIMP PROCESSING PLANTS,
Economic Development Administration Technical Assistance Project, Report 01-6-09226, 1972, 58 p, 2 fig, 79 ref, 4 append.

Descriptors: *Industrial wastes, *Food processing industry, *Waste water treatment, *Feasibility, *Recycling, Chlorination, Filtration, Settling basins, Gloucester(Mass).

The number and size of shrimp processing plants were determined which might be accommodated by the City of Gloucester water supply system, and the feasibility of possible waste water recovery systems was evaluated. Shrimp processing practices were reviewed, and water use and waste water characteristics of modern shrimp peeling machines were determined. The water quality required for shrimp processing was investigated. Possible waste water treatment and recovery systems were selected for possible further development. Water treatment would possibly include chlorination, filtration, and clarification. Abstracts are provided of literature studied. (Small-FRC)

A METHOD OF MANURE DISPOSAL FOR BEEF PACKING OPERATION,
Procedyne Corp., New Brunswick, NJ.
R. Ricci.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 316, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-103, 1977. 63 p, 17 fig, 6 tab, 11 ref.

Descriptors: *Food processing industry, *Industrial wastes, *Filtration, *Dewatering, *Incineration, Farm wastes, Ultimate disposal, Cattle.

Preliminary studies are described for process design of a system to successfully treat paunch manure in a beef slaughtering operation. Preliminary studies were conducted to determine paunch manure characteristics, the present disposal system was evaluated, and paunch manure filtration studies were performed. A process designed in which the paunch manure is collected from the slaughtering operation and fed to a screening device which separates the coarse solids. The screenings are dewatered to a solids content of 37%, and the dewatered material is incinerated in a fluid bed incinerator. The liquid from the screening step is fed to a settler and is combined with the liquid stream from the dewaterer prior to sand filtering. The filter cake is also incinerated. The filtrate is recycled back to the settler. (Small-FRC)

APPLICATION OF SEQUENCING BATCH REACTORS FOR TREATMENT OF MUNICIPAL AND INDUSTRIAL WASTEWATERS (FIRST ANNUAL REPORT, JULY 1, 1976 TO JUNE 30, 1977),
Notre Dame Univ., IN. Dept. of Civil Engineering.
R. L. Irvine.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 846, Price codes: A07 in paper copy, A01 in microfiche. Report NSF/RA-770259, 1977. 146 p, 8 fig, 3 tab, 31 ref, 5 append.

Descriptors: *Industrial wastes, *Municipal wastes, *Waste treatment, *Unsteady-flow, *Performance, *Biological treatment, Laboratory tests, Phosphorus, Market value, Computers.

Fill and draw reactors are evaluated in terms of their applicability to a wide variety of treatment areas, and design and control procedures are developed. An attempt is made to develop batch technology as a viable option to conventional continuous flow systems which can satisfy present and future effluent requirements. User market areas are defined. Three primary research products and user areas are actively investigated: (1) Microprocessor control system for batch or continuous flow treatment systems, (2) Single tank batch reactors for small municipalities and small industries in rural areas, and (3) Multiple tank batch reactors for larger municipalities and industries. A micro-computer control system using microprocessors is feasible for small and large treatment systems. Laboratory studies of batch treatment application to high strength wastes demonstrated that the batch system is extremely efficient from a substrate to organism conversion point of view. Also, the development of filamentous organisms and the settling characteristics of the organisms can be controlled in a batch treatment system. The relative growth rate of the filamentous organisms to the remaining organisms was strongly influenced by the waste concentration. Chemical treatment studies of the removal of phosphorus with iron salts found that the batch system developed a better flocculating sludge, was less sensitive to pH, and produced better quality effluent with reduced iron dosages when compared to continuous flow. SHIPBOARD EVALUATION OF A CARLSON MARK 10 CHLORINATOR/MACERATOR SANITARY WASTE-WATER TREATMENT SYSTEM,
David W. Taylor Naval Ship Research and Development Center, Bethesda, MD.
C. S. Alig.
Available from the National Technical Information

Service, Springfield, VA 22161 as AD-919 175, Price codes; A03 in paper copy, A01 in microfiche. Report 28-939, 1974. 47 p, 7 fig, 10 ref, 5 append.

Descriptors: *Waste water treatment, *Ships, *On-site tests, *Performance, *Chlorination, *Mechanical equipment, Aeration, Maintenance, Regulation, Coliforms.

The Carlson Mark 10 chlorinator/macerator sanitary wastewater treatment system was technically evaluated aboard USS Fidelity (MSO 443). Compliance with effluent quality standards set forth in MIL-S-24201B (SHIPS) was evaluated, as was the ability to obtain reliability and maintainability information. During a 1150-hour test, the system treated 16,600 gallons of wastewater. Over 28% of the samples collected exceeded military standards for effluent coliform bacteria. Eight failures were experienced which resulted in a mean time between failures of 88.5 hours at a 90% confidence interval. The maximum failure repair time was two hours and 40 minutes. Military stands were not met, and the chlorinator/macerator did not satisfy the test plan for reliability and maintainability. Effluent bacterial quality could be improved by increasing chlorination, but then high levels of chlorine would enter receiving waters. A simple preventive maintenance program could reduce system downtime. (Small-FRC)

THE EFFECT OF POLYACRYLAMIDE MOLECULAR STRUCTURE ON FLOCCULATION ACTIVITY OF DOMESTIC SEWAGE,
Rose-Hulman Inst. of Tech., Terre Haute, IN. Dept. of Chemical Engineering.
J. Caskey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 016, Price codes: A06 in paper copy, A01 in microfiche. Report GK-43989, 1977. 101 p, 29 fig, 16 tab, 40 ref, 8 append.

Descriptors: *Flocculation, *Polymers, *Suspended solids, *Organic matter, *Molecular structure, Hydrolysis, Hydrogen ion concentration, Sewage treatment, Cations.

The flocculating effectiveness of the branched and linear polymer fractions for suspended solids and organic matter removal was investigated. Linear and branched polyacrylamides were polymerized, the samples were fractionated into different molecular weight portions, and the resulting fractions were hydrolyzed to several anionic levels. Settling rate ratio tests with three weight percent kaolin slurries indicated increased flocculation effectiveness with increased molecular weight in a solution pH of 6.0. The effects of polymer molecular structure were studied on 220 ppm kaolin slurries and domestic sewage, and the polymer did not improve the rate of flocculation. These results confirmed the necessity of multivalent cation addition for effective flocculation of dilute slurries. A linear structure was more effective than a branched structure. Also, increasing molecular weights increased the flocculation effectiveness of the polymer for both linear and branched polymers within the molecular weight range studied. The polymer should be hydrolyzed in the range of 15-30% for optimum effectiveness. (Small-FRC)
W79-07805

CYANIDE REMOVAL FROM PETROLEUM REFINERY WASTE WATER USING POWDERED ACTIVATED CARBON,
IIT Research Inst., Chicago, IN.
J. E. Huff, and J. M. Bigger
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 862, Price codes: A06 in paper copy, A01 in microfiche. Report, 1977. 107 p, 24 fig, 25 tab, 19 ref, 1 append.

Descriptors: *Activated carbon, *Copper compounds, *Oil industry, *Oil wastes, *Adsorption, Oxidation, Continuous flow, Laboratory tests, Aqueous solutions, Activated sludge, Aerated lagoons, Waste water treatment, Industrial wastes

Batch and continuous tests were performed to evaluate the treatment of cyanide-bearing refinery waste waters with powdered activated carbon (PAC) and cupric chloride. The operating parameters of pH, copper dosage, mode of copper addition, carbon dosage, and type of carbon were varied to investigate the basic chemistry and cyanide removal efficiency of the adsorption and catalytic oxidation of cyanide. When the pH was in the neutral range, low equilibrium cyanide in the aqueous solution was achieved while a low copper level was maintained. When solutions containing 0.5 mg/liter iron cyanide were treated with 250 mg/liter PAC and 1.0-1.5 mg/liter of copper, greater than 95% removal of cyanide was achieved in batch tests. In the continuous tests, two laboratory scale activated sludge units were used and carbon and copper were added to the aeration basin. The results of this study indicated that cyanide could be effectively removed by the addition of PAC and cupric chloride to the activated sludge unit without reduction of the biological efficiency of the unit. The treatment process appeared economically attractive for refineries because no capital expenditures are necessary. (Lisk-FRC)

EVALUATION OF LEACHATE TREATMENT VOLUME 1: CHARACTERIZATION OF LEACHATE,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
E. S. Chian, and F. B. DeWalle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 885, Price codes: A11 in paper copy, A01 in microfiche. Report EPA-600/2-77-186a, 1977. 226 p, 47 fig, 18 tab, 34 ref.

Descriptors: *Leachate, *Landfills, *Aerobic treatment, *Anaerobic treatment, *Heavy metals, Degradation, Waste water treatment, Water pollution sources, Activated carbon, Reverse osmosis.

Leachate samples collected from landfills located in the United States were analyzed for organics and inorganics. Also, bench-scale performance data were obtained for selected leachate treatment methods. Leachate from recently constructed landfills was best treated by aerobic or anaerobic processes. Leachate from stabilized landfills was best treated by activated carbon and reverse osmosis. Membrane ultrafiltration, gel permeation chromatography, and specific organic analysis were used on leachate samples to separate different molecular fractions and to determine the main types of organics and associated functional groups. Biological degradation studies revealed the sequential removal of different classes of organics presents in leachate from a recently constructed solid waste lysimeter. In most leachate, high levels of heavy metals were present. Generally, the metal concentrations did not cause toxic effects due to the formation of hydroxides and carbonates in aerobic systems and sulfides and carbonates in anaerobic systems. W79-07807

EVALUATION OF LEACHATE TREATMENT VOLUME 2: BIOLOGICAL AND PHYSICAL-CHEMICAL PROCESSES,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
E. S. Chaian, and F. B. DeWalle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 855, Price codes: A05 in paper copy, A01 in microfiche. Report EPA-600/2-77-186b, 1977. 265 p, 86 fig, 20 tab, 4 ref.

Descriptors: *Anaerobic digestion, *Filtration, *Aerated lagoons, *Activated sludge, *Leachate, *Performance, Costs, Biochemical oxygen demand, Activated carbon, Oxidation, Organic matter.

The efficiencies of anaerobic filtration, aerated lagoons, and activated sludge units in removing organic matter from solid waste leachate were investigated. A completely mixed anaerobic filter, in which the effluent is diluted with recirculated effluent, was found to effectively remove organic matter concentrations in high strength, solid waste leachate over a range of organic loadings and shock loads. Various physical-chemical treatment methods such as chemical precipitation, activated carbon adsorption, and chemical oxidation were investigated and found to be not very effective in removing organic matter. Higher adsorptive capacities were observed for biologically pretreated leachate. Biologically aerated lagoons had TOC removal efficiencies of 96.8-99%, and, had high heavy metal removal rates. The combined treatment of leachate and municipal sludge in a conventional plugflow activated sludge unit effectively treated high strength leachate. Cost esimates were obtained. The aerated lagoon was the least expensive process. The combined treatment of leachate using the activated sludge process had a high dilution factor, especially when leachate BOD levels were low and flow rates were high. W79-07808

APPLICATION OF OXYGEN TO TREAT WASTE FROM MILITARY FIELD INSTALLATIONS, PART I. INACTIVATION OF VIRUS IN BENCH-SCALE OXYGENATED WASTE STABILIZATION PONDS,
Texas Univ. at Austin. Dept. of Environmental Health Engineering.
A. R. Melbard, J. F. Malina, and C. W. Beere.
Available from the National Technical Information Service, Springfield, VA 22161 as AD/A-027 092, Price codes: A06 in paper copy, A01 in microfiche. Report, 1974. 112 p, 2 fig, 20 tab, 23 ref, 1 append.

Descriptors: *Viruses, *Sewage bacteria, *Oxygenation, *Oxidation lagoons, *Suspended solids, Chemical oxygen demand, Biochemical oxygen demand, Sewage sludge, Oxygen, Waste water treatment, Municipal wastes.

The application of high purity oxygen to waste stabilization ponds can prevent the reduction of treatment efficiency during overloaded conditions. While stabilization ponds treating municipal wastes may accomodate loadings from 20-70 lbs BOD/acre/day, a loading of 50 lbs BOD/acre/day is considered the average design figure. The effects of oxygenation on the inactivation of enteric viruses and bacteria were studied in a pond incorporating a downflow bubble contact aeration system utilizing pure oxygen. Settled municipal waste water was used as the feed and oxygen transfer efficiencies greater than 95% were achieved. The yield was 0.47 lb volatile suspended solids/lb COD removed; the decay coefficient was 0.02/day. The maximum specific growth rate was 3.7 lb volatile suspended solids produced per pound volatile suspended solids; the half-velocity constant was 281 mg/liter. The system achieved 94.5% BOD removal at substrate removal rates of up to 0.73 lb BOD/lb mixed liquor suspended solids/day. Sludge separation was enhanced by auxiliary mixing and the sludge volume index was 84 ml/g. The introduction of high purity oxygen to the waste stabilization ponds increased the dieoff and inactivation of enteric viruses and bacteria. (See also W79-07810) (Lisk-FRC)
W79-07809

APPLICATION OF OXYGEN TO TREAT WASTE FROM MILITARY FIELD INSTALLATIONS PART II. AN EVALUATION OF AN ACTIVATED SLUDGE PROCESS EMPLOYING DOWNFLOW BUBBLE CONTACT AERATION,
Texas Univ. at Austin. Dept. of Environmental Health Engineering.
A. R. Melbard, J. F. Malina, and C. W. Beere.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A027 034, Price codes: A05 in paper copy, A01 in microfiche. Report 1974. 96 p, 19 fig, 8 tab, 46 ref, 1 append.

Descriptors: *Activated sludge, *Aeration, *Oxygenation, *Pilot plants, *Biochemical oxygen demand, Chemical oxygen demand, Suspended solids, Design criteria, Waste water treatment, Municipal wastes.

The performance of a downflow bubble contact aeration system in an activated sludge waste water treatment system was evaluated. Kinetic coeffi-

ient calculations indicated that the sludge yield vas 0.47 lb volatile suspended solids/lb COD removed, the endogenous respiration coefficient was 0.02/day, the maximum net specific growth rate vas 3.7 lbs volatile suspended solids produced/lb volatile suspended solids, and the substrate concentration at half the maximum net specific growth rate was 281 mg/liter. The concentration at half he maximum net specific growth rate was 281 ng/liter. The system removed 94.5% of the BOD, 30.4% of the COD and 70.0% of the suspended solids. Modifications to the system eliminated sludge flotation and significantly improved solids separation. The installation of automatic monitoring and control equipment was considered necessary to maintain longer unattended, uninterupted service. The design of the system was inflexible to severe changes in the loading; the addition of an equalization basin to overcome high peak loadings may reduce the variability of performance. A pop-off valve to reflood the chamber in the event of phase separation was recommended. Other recommendations for designing pilot plant and large scale activated sludge systems with downflow bubble contact aeration were presented. (See also W79-07809) (Lisk-FRC)
W79-07810

USA-USSR WORKING GROUP ON THE PREVENTION OF WATER POLLUTION FROM MUNICIPAL AND INDUSTRIAL SOURCES SYMPOSIUM ON PHYSICAL-MECHANICAL TREATMENT OF WASTEWATERS, HELD AT CINCINNATI, OHIO ON APRIL 5-6, 1977,
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 663, Price codes: A07 in paper copy, A01 in microfiche. 1977. 144 p, 81 fig, 19 tab, 102 ref. No. 9, Environmental Protection Agency, Washington, DC.

Descriptors: *Industrial wastes, *Municipal wastes, *Waste water treatment, *Sewerage, *Filtration, Settling basins, Incineration.

Thirteen papers were presented on the physical-mechanical methods of waste water treatment. Topics included pyrolysis of municipal and industrial wastes, physical treatment of oil refinery waste water, radial settling tanks, and effluent treatment in the paper industry. Also discussed were: microstrainers, the role of zeta potential in refinery waste waters, Sala-HGMF high gradient magnetic filters, flotation, and tertiary granular filters. The treatment of mining, metallurgical, and oil-chemical wastes, the swirl concentrator, and sewerage in Moscow are also discussed. (See W79-07812 thru W79-07824) (Small-FRC)

PYROLYSIS APPLICATIONS FOR INDUSTRIAL AND MUNICIPAL TREATMENT,
Envirotech Corp., Menlo Park, CA.
F. P. Sebastian, D. S. Lachtman, G. K. Kroneberger, and T. D. Allen.
In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio, p 5-14, 1977. 5 fig, 3 tab, 6 ref.

Descriptors: *Ultimate disposal, *Incineration, *Sludge disposal, *Evaluation, Industrial wastes, Municipal wastes, Economics, Regulations, Energy, Water quality.

Pyrolysis in a multiple hearth furnace was investigated and found to have a number of advantages over conventional incineration. This process improves process control and prevents clinker formation. Also, it offers economical energy recovery. Other advantages include increased furnace capacity, potential revenue from stream or power, reduced particulate loading prior to scrubbing, and a permanent solution to solids disposal. The method has numerous industrial applications. Pyrolysis in a multiple hearth furnace meets Environmental Protection Agency emission regulations, and has been proven on a full scale. Bacterial, viral, and organic contamination of groundwater is avoided when thermal destruction methods are used. (See also W79-07811) (Small-FRC)

WASTE WATER TREATMENT BY PHYSICAL AND MECHANICAL METHODS,
Vsesoyuznyi Nauchno-Issledovatelskii Inst. Vodosnabzheniya, Kanalizatsii, Gidrotekhnicheskikh Sooruzhenii i Inzhenernoi Gidrogeologii, Gosstroi (USSR).
I. N. Mjasnikov, V. G. Ponomarjev, A. P. Nechaev, and I. V. Kedrov.
In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio, p 15-22, 1977. 10 fig.

Descriptors: *Sedimentation, *Centrifugation, *Filtration, *Flotation, Waste water treatment, *Performance, Municipal wastes, Industrial wastes, Mechanical equipment.

Waste water treatment by physical and mechanical methods is reviewed, and the results of investigations carried out by VODGEO are mentioned. Sedimentation is discussed. Hydraulic investigations of thin-layer settling tanks that operate according to cross scheme have indicated that maximum efficiency of volume utilization up to 80-90% is achieved when using proportional water distribution devices designed by VODGEO. Pressure hydrocyclones are described, and a hydrocyclone with an internal cylinder and tapered membrane located in the upper part and a multistage hydrocyclone are discussed. Other centrifuges considered include bowl centrifuges, pendulum centrifuges, and scroll centrifuges. VODGEO investigated low-speed centrifuges with a separation factor up to F = 800. Flotation treatment methods are described, and filtration of waste water is discussed. VODGEO has found that the use of a filter charged with polyurethane removed 90% of oil from waste water at a filtering rate of up to 20 m/hr. (See also W79-07811) (Small-FRC)
W79-07813

PHYSICAL TREATMENT OF OIL REFINERY WASTEWATER,
Environmental Protection Agency, Washington, DC. Office of Research and Development.
W. J. Lacy.
In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio, p 23-26, 1977.

Descriptors: *Activated carbon, *Industrial wastes, *Oil industry, *Adsorption, *Performance, Costs, Chemical oxygen demand, Separation techniques, Oxidation.

Physical treatment is defined, and the results of a demonstration project on activated carbon treatment of refinery effluent are presented. Gravity separation, solvent extraction, adsorption, combustion, and filtration are described. The demonstration treatment system was made up of four main systems plus an impounding reservoir. The water treatment unit reduces the organic COD of water impounded in the refinery prior to discharge. It consists of 12 identical adsorber cells, each cell containing a 4 m deep bed of carbon having a dry weight of approximately 22,100 kg supported by gravel. The carbon regeneration system utilizes selective oxidation of the organic impurities in the pores at high temperatures (900-970C) and with a controlled low oxygen atmosphere in a multiple hearth furnace. During the two-year project, 172,040,000 gallons of water was processed to load 747,000 kg of carbon with 165,000 kg or COD. The overall operating cost was 49 cents per 1000 gallons of water treated, or 524 kg of COD removal from the water. During the second year, the plant demonstrated the ability to operate at 40 cents per 1000 gallons of water treated. (See also W79-07811) (Small-FRC)
W79-07814

IMPROVEMENT OF HYDRAULIC CONDITIONS OF RADIAL SETTLING TANKS,
Vsesoyuznyi Nauchno-Issledovatelskii, Vodosnabzheniya, Kanalizatsii, Gidrotekhnicheskikh Sooruzhenii i Inzhenernoi Gidrogeologii, Gosstroi (USSR).
I. V. Skirdov.
In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio, p 26-30, 1977. 3 fig.

Descriptors: *Sedimentation, *Settling basins, *Hydraulic machinery, *Performance, Design, Waste water treatment.

The advantages of radial settling tanks over other types of settling tanks are discussed, and a new type of radial tank developed in the USSR is described. Radial settling tanks are often utilized at large treatment facilities. The hydraulic conditions of conventional radial settling tanks do not ensure the effective use of most of these installations. The newly developed tank has a water distributing device which rotates continuously with the scraping arm. Hydraulic conditions are improved, installation load can be increased about 1.5 times, and the depth of the tank can be significantly reduced, when the rotatory distributing device is employed. W79-07815

CURRENT STATUS AND DIRECTIONS OF DEVELOPMENT OF PHYSICO-MECHANICAL EFFLUENT TREATMENT IN THE PAPER INDUSTRY,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
I. Gellman.
In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio, p 31-39. 1977, 32 ref.

Descriptors: *Pulp and paper industry, *Industrial wastes, *Sedimentation, *Filtration, *Dewatering, Recycling, Activated sludge, Waste water treatment, Sludge treatment, Aeration, Settling basins, Flotation, Biological treatment.

Physico-chemical treatment of effluent in the paper industry is reviewed including: clarification of untreated or biotreated mill effluents by gravity separation or filtration, in-process use of treatment for improved water economy and reduction of organic load, and dewatering and disposal of sludge. Methods for the clarification of biotreated effluents are: Quiescent zone sedimentation in aerated stabilization basin systems, secondary sedimentation for activated sludge treatment systems, secondary flotation for aerated stabilization basin effluent clarification, and media filtration of biologically treated effluents. White water system reuse studies have included combination waste paperboard operations, fine paper manufacture, and tissue and towelling manufacture. Condensate stripping methods include kraft condensate processing and sulfite condensate processing. Current sludge dewatering practices are reviewed. In the future it is likely that total mill effluent clarification at the primary level will be characterized by physico-mechanical methods. At the secondary clarification level, more frequent use of coagulant aids is anticipated to meet water quality standards. Greater internal water reuse is expected, and stripping of condensates from chemical pulp mill liquor evaporation and heat recovery systems will become more extensive. (See also W79-07811) (Small-FRC)
W79-07816

EMPLOYMENT OF MICROSTRAINERS IN THE WASTE WATER TREATMENT PRACTICE,
Vsesoyuznyi Nauchno-Issledovatelskii Inst. Vodosnabzheniya, Kanalizatsii, Gidrotekhnicheskikh Sooruzhenii i Inzhenernoi Gidrogeologii, Gosstroi (USSR).
I. V. Skirdov, I. A. Sidorova, and Yu. L. Maximenko.
In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial

Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio, p 39-44, 1977. 4 fig.

Descriptors: *Filtration, *Performance, *Biochemical oxygen demand, *Suspended solids, *Industrial wastes, Waste water treatment, Effluent streams, Settling basins, Municipal wastes, Pulp and paper industry, Biological treatment.

In waste water treatment, microstrainers can be used as possible substitutes for primary clarifiers. Microstrainers are compact and economical, simple to operate, and permit the process to be automated. Microstraining provides BOD removal up to 25-30% and suspended solids removal by 45% (after pretreatment) and suspended solids removal by 50-60% and 30-40% removal of BOD (for final treatment). Microstraining is widely used for final treatment of biologically treated effluents of artificial fiber plants, pulp and paper complexes, chemical plants, and municipal sewage treatment plants. Pretreatment of waste waters with microstrainers is economically feasible. Capital expenditures can be reduced by 70 to 90% when microstrainers are used instead of primary clarifiers. When microstrainers are used for final treatment of biologically treated effluents, the area of the pond is reduced by one half. (See also W79-07811) (Small-FRC)
W79-07817

THE CONTROL OF REFINERY MECHANICAL WASTE WATER TREATMENT PROCESSES BY CONTROLLING THE ZETA POTENTIAL,
Amoco Oil Co., Chicago, IL.
J. F. Grutsch.
In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio. p 44-74, 1977. 26 fig, 6 tab, 13 ref.

Descriptors: *Oil industry, *Industrial wastes, *Filtration, *Optimization, *Zeta potential, Costs, Waste water treatment, Colloids, Flocculation, Flotation, Separation techniques.

Zeta potential titration curves are used to optimize waste water treatment. Zeta curves are used to quantify proper destabilization chemical treatment, compare chemical's effectiveness, and measure synergisms and antagonisms of various components in a waste stream. Thus, zeta potential curves can be used to determine the most cost effective of alternative treatment methods. Granular media filtration and dissolved air filtration, important in refinery waste water treatment, are described. Examples are presented which show the utilization of these methods to result in major capital and energy savings. For coke fines and biocolloids, pretreatment for the dissolved air filtration unit includes a flash mix (1-2 minutes) and flocculation zones (10-15 minutes) using two chemicals (cationic for destabilization and anionic for flocculation). A flotation zone loading of 1.5 gpm/sq ft and 30% recycle at 50 psi air pressurization are recommended for optimal phase separation. (See also W79-07811) (Small-FRC)
W79-07818

COMBINED STORM OVERFLOW TREATMENT WITH SALA-HGMF HIGH GRADIENT MAGNETIC FILTERS,
Sala Magnetics, Inc., Cambridge, MA.
D. M. Allen, and J. A. Oberteuffer.
In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio, p 75-91. 1977 5 fig, 6 tab, 16 ref.

Descriptors: *Filtration, *Pilot plants, *Performance, *Costs, *Design, Biochemical oxygen demand, Bacteria, Viruses, Turbidity, Phosphates, Heavy metals, Color.

Magnetic-seeded high gradient magnetic filtration is described which permits highly effective removal of BOD, COD, bacteria, color, turbidity, and viruses from contaminated waters. The theory and design of these filters is presented and applications to two types of polluted waters are described. A 4 liter/min continuous pilot plant is being used to investigate the applicability of the indirect filtration process for treating combined sewer overflow, storm water, secondary effluent, and dry weather sewage flow. The pilot plant contains a flocculation train in which all necessary chemical additions are made, a SALA-HGMF magnetic filter and power supply, and a surge tank and thickener to handle the backflushed flocs. Performance of the high gradient magnetic filters exceeds conventional treatment and significantly reduces the levels of phosphates, heavy metals, and viruses in waste waters. Capital cost for a high gradient magnetic filtration integrated wet and dry weather flow facility is $107,000/mgd as compared to $168,000/mgd for a comparable physical-chemical treatment facility, and $73,000/mgd for a dual media filtration plant using polyelectrolyte. (See also W79-07811) (Small-FRC)
W79-07819

USE OF FLOATATION FOR WASTE WATER TREATMENT,
Vsesoyuznyi Nauchno-Issledovatelskii Inst. Vodosnabzheniya, Kanalizatsii, Gidrotekhnicheskikh Sooruzhenii i Inzhenernoi Gidrogeologii, Gosstroi (USSR).
I. N. Mjasnikov, L. V. Gandurina, and L. N. Butseva.
In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio, p 91-99, 1977. 4 fig, 5 ref.

Descriptors: *Flotation, *Industrial wastes, *Oil industry, *Frothing, *Performance, Biochemical oxygen demand, Separation techniques, Oily water, Bubbles.

Flotation is used as a treatment method for waters contaminated with oil wastes, oil processing products, fats, resins, latexes, organic synthesis products, surface-active agents, and dyestuffs. The types of flotation used include compression, impeller, vacuum, biological chemical, electric, ionic, and froth separation. Compression is usually employed to treat oil containing waste water, and frother cells have been designed with up to 80-98% efficiency. Considerable reductions in COD and BOD have been achieved. For waste water treatment, system modifications include straight-flow, recirculation, and partially straight flow. Frother separation is used along with compression for final treatment of biologically purified waste water. A recent development, electroflotation, utilizes uniformly distributed, microbubbles of gas. Treatment of oil containing waste water with electroflotation can reduce the oil content up to 1-10 mg/liter when original concentration is 200 mg/liter. (See also W79-07811) (Small-FRC)
W79-07820

PERFORMANCE TESTS ON FULL-SCALE TERTIARY GRANULAR MEDIA FILTERS,
Northwestern Univ., Evanston, IL. Dept. of Civil Engineering.
J. A. FitzPatrick, and C. L. Swanson.
In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio. p 100-114, 1977. 9 fig, 4 tab, 6 ref.

Descriptors: *Filtration, *Performance, *Design, *Flow rates, *Suspended solids, Correlation analysis, Tertiary treatment.

Eight small-scale (0.8-2.5 mgd) tertiary granular media filtration plants in Chicago were evaluated. Filtration plant performance was characterized as a function of design and operational variables. For plants with varied flow to individual filters, average clarification performance decreased linearly with average flow rate. Relatively poor correlations were obtained between filter solids removal efficiency and operating parameters due to seasonal and other variations. Improved correlations were obtained for data analyzed over shorter time periods. Run length did not affect plant performance except in one case where backwash frequency was varied over a wide range. Variations in clarification efficiency from plant to plant were due to differences in characteristics of secondary effluent suspended solids rather than media grain size and depth. In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio. p 115-121, 1977. 5 fig.

Descriptors: *Industrial wastes, *Mineral industry, *Dewatering, *Chemical industry, *Flocculation, Filtration, Waste water treatment, Separation techniques.

Technologies developed by the Ukrvodokanalproekt Institute are described and discussed. A method was developed to recycle the water used in the extraction of iron from ore by clarification of the rock-pulp and pulp thickening. The basic design of the thickener is described. A vortex dispenser for the preparation of polyacrylamide solution is also described. The system saves up to 10% of the polyacrylamide and improves the process of pulp clarification and thickening. A project to remove cinder from rolling mill waste using magnetic flocculation is described. A project utilizing quartz filters for oil industry waste treatment is also described. Maximum pollution reduction and decreased water consumption are goals of all Ukrvodokanalproekt projects. (See also W79-07811) (Small-FRC)

THE SWIRL CONCENTRATOR FOR TREATING AND REGULATING SEWERED (SEPARATE AND COMBINED) AND UNSEWERED FLOWS,
Municipal Environmental Research Lab., Cincinnati, OH.
R. Field.
In: USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, April 5-6, 1977, Cincinnati, Ohio, p 122-133, 1977. 9 fig, 24 ref.

Descriptors: *Separation techniques, *Suspended solids, *Sedimentation, *Municipal wastes, Pilot plants, Erosion control, Urban runoff.

A swirl concentrator was developed and demonstrated for treating and regulating sewered and unsewered waste water flows. Swirl concentrators are static, non-mechanical devices which remove suspended solids by rotationally induced forces causing inertial separation and vertical gravity sedimentation with relatively short detention times. Swirl design characteristics are described, and a modeling study is discussed. Operation is described for a Syracuse, New York prototype swirl regulator/concentrator, a Denver, Colorado pilot swirl degritter, a Rochester, New York pilot swirl primary separator and swirl degritter, and a Lancaster, Pennsylvania prototype regulator/concentrator can also be used as an erosion control device or an urban runoff pollution control device. The swirl principal can be employed anywhere it is desirable to remove solids from liquid flows. Better efficiencies are achieved with steady flow conditions or when two half-size chambers are used rather than one full-size unit. (See also W79-07811) (Small-FRC)

SEWAGE TREATMENT OF THE CITY OF MOSCOW,

Vater Supply and Sewerage Administration, Ioscow (USSR).
. I. Galanin.
n: USA-USSR Working Group on the Prevention f Water Pollution from Municipal and Industrial ources Symposium on Physical - Mechanical reatment of Wastewaters, April 5-6, 1977, Cincinati, Ohio, p 133-138, 1977. 3 fig.

escriptors: *Activated sludge, *Municipal astes, *Sewerage, *Tertiary treatment, Industrial astes, Biological treatment, Water pollution ources.

Ioscow's sewerage and treatment systems are described. The central sewerage system serves 98.5% f the city's population with treatment plants with total capacity of 4,230,000 cu m/day. 4.3 million u m/day is subjected to biological treatment. bout 40% of this total is industrial wastes. Activated sludge plants are used and the discharging of aw sewage into waterways has almost been eliminated. The activated sludge plants utilize the following scheme: screens, grit chambers, primary ettling tanks, aeration tanks, secondary settling nks. Tertiary treatment is becoming more ommon. At the activated sludge plants treatment onsists of digestion in aerobic digesters at thermohilic conditions (52 C), washing and thickening, oagulation vacuum filtration, and heat drying. uture plans are discussed. THICKENING OF SLUDGES,
Delaware Univ., Newark.
R. I. Dick.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 93-100, 1975. 5 fig, 13 ref.

Descriptors: *Sludge treatment, *Dewatering, *Costs, *Design, *Optimization, Sludge disposal, Sedimentation rates, Equations.

Basic sludge thickening concepts are reviewed, and the optimum design for sludge thickeners is examined. The rational basis for design of thickeners is reviewed briefly, and the interaction of thickening with other sludge treatment and disposal processes is examined quantitatively. Thickening greatly influences the cost of sludge treatment and disposal because the cost effectiveness of sludge treatment and disposal techniques depends on the concentration of solids in the sludge. The effect of the design of thickeners on the cost of sludge treatment are discussed. Thickeners should be sized with regard to the thickening properties of the sludge being treated and the settling characteristics of the sludge. An equation is presented for the calculation of required thickener size. (See also W79-07825) (Small-FRC)

DISSOLVED AIR FLOTATION THICKENING AS PRACTICED IN THE U. S.,
Envirex, Inc., Waukesha, WI.
W. N. Konrad.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 101-108, 1975. 7 fig.

Descriptors: *Sludge treatment, *Flotation, *Pilot plants, *Optimization, Design, Flow rates, Suspended solids, Pressure.

Dissolved air flotation thickening secondary of biological sludges has demonstrated its ability to reduce the hydraulic loading on subsequent units. In the United States applications include preceding anaerobic digestion, vacuum filtration, or centrifugation. Design parameters which must be considered in this process are spacing and speed of flights which remove the surface thickening sludge, frequency of removal, tank configuration, source of pressurized flow, and air to solids ratio. High rate loadings and various air to solids ratios were evaluated on a full scale dissolved air thickener. An attempt was made to determine what happens when the air to solids ratio is changed by changing the pressure and then by keeping the same pressure and changing the air to solids ratio by changing the volume of recycle flow which contains the dissolved air. A change in the air to solids ratio by increasing the pressure was detrimental to the operation of the unit, and 40 psig was the optimum operating pressure. The air to solids ratio can be converted directly to a practical design approach by using 100% recycle or pressurized flow for every 1/2% of influent sludge concentration while operating at 40 psig. An air to solids ratio of about 0.015 results. (See also W79-07825) (Small-FRC)

PROCEEDINGS OF THE SEMINAR ON CURRENT APPROACHES IN WASTEWATER TREATMENT.
Held April 5, 1978 at the Ontario Ministry of Health Laboratories, Toronto, Canada. (1978) 140 p, 25 fig, 22 tab, 82 ref. Pollution Control Association of Ontario and the Ontario Ministry of the Environment.

Descriptors: *Sewage treatment, Water treatment, *Grants, *Tertiary treatment, *Dewatering, *Oxidation, Vacuum drying, Nitrification, Activated sludge, Biological treatment, Disinfection, Waste water treatment, Municipal wastes.

Six papers were presented on current processes and methods of evaluating waste water treatment alternatives. Topics discussed included Ontario's grant policy for low-cost alternatives to communal water and sewage treatment, tertiary treatment experience in a region of Canada, operating experience with the Zimpro low-pressure, wet air oxidation unit, treatability studies for initiating nitrification in activated sludge systems, fixed film biological process utilization, and methods of evaluating disinfection alternatives. YORK REGION'S OPERATIONAL EXPERIENCE WITH TERTIARY TREATMENT,
J. W. G. Rupke, J. D. Seldon, and A. T. Robson.
In: Proceedings of the Seminar on Current Approaches in Wastewater Treatment, April 5, 1978, Ontario Ministry of Health Laboratories, Toronto, Canada, p 7-36, 1978. 10 tab.

Descriptors: *Tertiary treatment, *Filters, *Canada, *Settling basins, *Treatment facilities, Dewatering, Cost comparisons, Sands, Coals, Biochemical oxygen demand, Suspended solids, Phosphorus, Waste water treatment, Municipal wastes.

More than half of the 11 municipal waste water treatment plants in the Regional Municipality of York in Canada utilize tertiary treatment. The flows at the treatment plants range from .44-2.40 imperial mgd and utilize gravity or pressure filters; one plant provides tertiary clarification. Filter areas range from 255-20,000 sq ft and utilize single layers or mixtures of anthracite, sand, and/or gravel. Effluent from the plants meet discharge guidelines for BOD, suspended solids, and total phosphorus. While the tertiary clarification system has been relatively trouble free, the operation requires more labor and costs and must be monitored and controlled on a daily basis. The filters must be enclosed in a building whereas the clarifiers may be exposed and may also be used as chlorine contact basins. Tertiary clarifiers may require chemical sludge thickening tanks. (See also W79-07842) (Lisk-FRC)
W79-07844

ROLE OF TREATABILITY STUDIES FOR THE DESIGN AND OPERATION OF NITRIFICATION IN ACTIVATED SLUDGE PLANTS,
Ontario Ministry of the Environment, Toronto.
A. G. Smith.
In: Proceedings of the Seminar on Current Approaches in Wastewater Treatment, April 5, 1978, Ontario Ministry of Health Laboratories, Toronto, Canada, p 47-71, (1978). 5 fig, 2 tab, 23 ref.

Descriptors: *Nitrification, *Activated sludge, *Optimization, *Aeration, *Alkalinity, Toxicity,

Nitrates, Nitrites, Waste water treatment, Municipal wastes.

Control parameters necessary for promoting nitrification in activated sludge systems are reviewed as an alternative to the expansion of the aeration basins. Conditions in the reactor must be maintained suitable for the growth of nitrosomas and nitrobacters which convert ammonia to nitrite and nitrate. The activated sludge system may be a single sludge system in which both carbonaceous and nitrogenous oxidation occur simultaneously or a two sludge system where the processes are separated. When the ratios of BOD/total Kjeldahl nitrogen and COD/NH4-N (C/N) are reduced, increased nitrification per reactor volume may be achieved. Because a high C/N ratio waste water will stimulate heterobacter bacteria growth, this ratio should be reduced to 2:1 to promote nitrifier growth. The optimum pH for the nitrifiers is between 7.2-8.3; nitrification rates increase with increasing pH and may reduce aeration requirements. Effluent alkalinity should be maintained at 50 mg/liter as CaCO3 for effective nitrification. The nitrification rate improves when dissolved oxygen content is raised from 1 to 2 mg/liter. Chromium, nickel, copper, phenols and other organic materials can be toxic to the nitrifiers at certain concentrations. Lower waste water temperatures will require higher solids retention times. Treatability evaluations, plant influent analysis, historical plant data, and full-scale evaluation are recommended when implementing nitrification in activated sludge. (See also W79-07842) (Lisk-FRC)
W79-07846

NEW DEVELOPMENTS UTILIZING FIXED FILM BIOLOGICAL PROCESSES,
Dorr-Oliver Inc., Stamford, CT.
P. M. Sutton.
In: Proceedings of the Seminar on Current Approaches in Wastewater Treatment, April 5, 1978, Ontario Ministry of Health Laboratories, Toronto, Canada, p 73-115. (1978) 17 fig, 4 tab, 42 ref.

Descriptors: *Trickling filters, *Biological treatment, *Porous media, *Packed beds, *Nitrification, Aerobic treatment, Anaerobic digestion, Denitrification, Industrial wastes, Waste water treatment, Municipal wastes.

The use and performance of fixed film biological reactors are discussed for the treatment of municipal and industrial waste waters and for nitrification. Trickling filters, supporting a biological slime on rocks, wooden slats, plastic sheets, or other support media, are utilized for treating municipal effluent, industrial wastes, and ammonia concentrations and have led to the development of other packed bed reactors for both aerobic and anaerobic treatment. The types of reactors include fixed bed upflow reactors containing porous media of various sizes exhibiting minor pressure gradients; expanded bed upflow reactors demonstrating a constant pressure gradient; and fixed bed downflow or upflow reactors with increasing pressure gradients which require backwashing or flushing. Rotating biological contractors have eliminated problems common to trickling filters and other fixed beds and have been utilized in the treatment of industrial waste waters and the denitrification of municipal waste waters. The principles, design fundamentals, and design considerations are described for fixed film reactors, expanded or fluidized bed reactors, and rotating biological contactors. Applications and performance efficiencies of fixed film and suspended growth systems were compared. (See also W79-07842) (Lisk-FRC)
W79-07847

EVALUATING DISINFECTION ALTERNATIVES,
F. A. Tonelli, and A. K. W. Ho.
In: Proceedings of the Seminar on Current Approaches in Wastewater Treatment, April 5, 1978, Ontario Ministry of Health Laboratories, Toronto, Canada, p 117-138. (1978) 2 fig, 4 tab, 17 ref.

Descriptors: *Disinfection, *Comparative benefits, *Chlorine, *Ozone, *Ultraviolet radiation, Bromine, Toxicity, Cost comparisons, Coliforms, Viruses, Chemical properties, Waste water treatment, Waste water disposal, Municipal wastes.

Chlorine and disinfectant alternatives were evaluated for effectiveness, use-cost, practicality, and potential adverse effects. The disinfectants investigated include chlorine, chlorine dioxide, ozone, bromine chloride, and ultraviolet radiation. Effectiveness was evaluated as the disinfectant's ability to reduce total and fecal coliforms, to inactivate viruses, and to eliminate other pathogenic bacteria. Use-costs were considered as capital costs, amortization costs, operating and maintenance costs, and costs of special waste water pretreatment. Practicality evaluations considered factors of transport, storage, on-site generation, application, control, disinfection predictions, and safety. Desirable properties of chemical disinfectants were considered to be: chemical weakness, predictable chemistry in waste water, readible solubility, and nontoxic or fast-decaying residual; desirable radiation properties include chemical weakness and adequate penetrating power. Potential adverse effects of the disinfected waste water on the receiving waters are considered as toxicity to aquatic life, the formation and transmission of undesirable bio-accumulating substances, and the formation and transmission of toxic, mutagenic, or carcinogenic substances. Results of the evaluation indicated that no single, widely applicable alternative to chlorine disinfection had been demonstrated. Ozone was considered the best developed alternative, but its cost is high and it has limited applicability. Dechlorination was considered feasible for reducing the toxic effects of chlorine. W79-07848

PROCEEDINGS OF THE 23RD ONTARIO INDUSTRIAL WASTE CONFERENCE.
Held June 13-16, 1976 at Toronto, Ontario. (1976) 483 p. Ministry of the Environment, Ontario.

Descriptors: *Industrial wastes, *Sewage disposal, *Waste water treatment, *Separation techniques, Oil industry, Heavy metals, Pesticide residues.

The proceedings of the 23rd Ontario Industrial Waste Conference contains 19 papers on the disposal and treatment of industrial wastes. Topics include the control of hydrogen sulfide emissions at a heavy water plant, control of heavy metal levels discharged into municipal sewers, and solid/liquid separation techniques. A refinery waste water treatment system, pollution abatement at a starch plant, waste water treatment at a General Motors plant, and control of PCBs are discussed. The role of the Ministry of the Environment in the disposal of liquid industrial waste is summarized. (See W79-07850 thru W79-07857) (Small-FRC)
W79-07849

DISCHARGE OF HEAVY METALS TO MUNICIPAL SEWERS 'THE CRUNCH MAY COME',
Ontario Ministry of the Environment, Toronto. Wastewater Treatment Section.
S. A. Black.
In: Proceedings of the 23rd Ontario Industrial Waste Conference, held June 13-16, 1976, Toronto, Ontario, p 155-178. (1976) 7 tab, 25 ref.

Descriptors: *Heavy metals, *Industrial wastes, *Municipal wastes, *Ultimate disposal, Regulation, Sewage treatment, Toxicity, Sludge disposal.

Increasingly high heavy metals content in municipal sewage may cause problems in sewage treatment and ultimate disposal of sewage sludge. Heavy metals are in industrial wastes which are often discharged into city sewers and in domestic wastes. Heavy metals reduce the efficiency of aerobic sewage treatment and anaerobic digestion of sewage sludges. Also, high levels of heavy metals can prevent sludge disposal on agricultural lands. One control method is the precipitation and recovery of metals from the sewage or sludge. Fluidized bed electrodes and digestion with sulfuric acid are two methods of removal from sewage. Industries can be regulated to reduce heavy metals discharge. Examples of this approach in the cities of Windsor and Waterloo are described. (See also W79-07849) (Small-FRC)
W79-07850

THE CONTROL OF HYDROGEN SULPHIDE EMISSIONS AT ONTARIO HYDRO'S BRUCE HEAVY WATER PLANT,
Bruce Heavy Water Plant Ontario Hydro, Tiverton.
S. A. C. Franklin.
In: Proceedings of the 23rd Ontario Industrial Waste Conference, held June 13-16, 1976, Toronto, Ontario, p 70-103, (1976), 23 fig.

Descriptors: *Hydrogen sulfide, *Separation techniques, *Monitoring, *Industrial wastes, Waste water treatment, Water pollution sources, Lake Huron.

Air and water hydrogen sulfide emissions are controlled at Ontario Hydro's Bruce Heavy Water Plant A which uses hydrogen sulfide to extract deuterium from natural water. All water streams containing H2S are stripped before returning the water to Lake Huron. The strippers discharge their effluent into a common line which can be diverted to lagoons. The effluent stripper process parameters including feed temperature, level, and pressure were interlocked to automatically divert the effluent to lagoons if the measured variables exceeded defined limits. Also, an H2S monitor was installed which prevents any sour water from entering the lake. Operator training was found to be an essential part of pollution control. (See also W79-07849) (Small-FRC)
W79-07851

SOLID LIQUID SEPARATION UTILIZING AN INCLINED PLATE SEPARATOR AND FILTER PRESS,
Control and Metering Ltd., Toronto (Ontario).
R. Verstraete.
In: Proceedings of the 23rd Ontario Industrial Waste Conference, held June 13-16, 1976, Toronto, Ontario, p 179-201. (1976) 8 fig, 1 tab, 10 ref.

Descriptors: *Separation techniques, *Filters, *Costs, *Performance, *Sludge treatment, Dewatering, Sedimentation, Industrial wastes.

The principle of operation of the inclined plate clarifier is reviewed, and operating experience in Ontario is discussed for the inclined plate separator and filter press. The inclined plate clarifier is efficient, easy to operate, requires reduced floor space, has no moving parts, and has low capital costs. It requires as little as 10% of the floor space of conventional clarifiers and installed costs are less than 50% of conventional clarifiers. The recessed plate filter press is a sludge dewatering device. The solids from the sludge are retained within the filter media to form a low volume dry cake of 30-60% solids while producing a clear filtrate. Filter presses have high efficiency, low energy consumption, and low manpower requirements. (See also W79-07849) (Small-FRC)
W79-07852

DEVELOPMENT AND IMPLEMENTATION OF AN IMPROVED WASTE WATER TREATMENT SYSTEM AT IMPERIAL'S SARINA REFINERY,
Imperial Oil Enterprises, Ltd., Sarnia (Ontario).
G. W. Schindel.
In: Proceedings of the 23rd Ontario Industrial Waste Conference, held June 13-16, 1976. Toronto, Ontario, p 202-230. (1976) 7 fig, 4 tab.

Descriptors: *Oil industry, *Waste water treatment, *Filtration, *Design, *Pilot plants, Regulation, Sewerage, Suspended solids, Industrial wastes.

A program to upgrade the waste water treatment capability at Imperial Oil Enterprises, Ltd.'s Sarnia Refinery initiated in 1970 is described. It included a comprehensive program to segregate sewer systems with a view toward minimizing the volume of contaminated water requiring further treatment. Also, a dual media gravity flow filtration system was installed for secondary removal of oil and suspended solids. An activated sludge plant was

installed to remove a substantial portion of the dissolved organics from the refinery effluent. Developmental and pilot studies are discussed along with the design details of the system. Operating experience is reported and compared to predicted performance. The treatment system has provided the refinery with a system entailing the best practicable technology and which has the capability to meet all Provincial and Federal guidelines. (See also W79-07849) (Small-FRC)
W79-07853

POLLUTION ABATEMENT AT CANADA STARCH - A CASE STUDY,
Canada Starch Co. Ltd., Cardinal (Ontario).
G. N. Fulford.
In: Proceedings of the 23rd Ontario Industrial Waste Conference, held June 13-16, 1976, Toronto, Ontario, p 231-264. (1976) 8 fig, 4 tab, 16 ref.

Descriptors: *Industrial wastes, *Biochemical oxygen demand, *Monitoring, *Aerobic treatment, Aeration, Waste water treatment, Water pollution sources.

The pollution problems associated with the operation of a corn wet milling plant and their solution at one site are discussed. The effluent streams were divided into those acceptable for discharge into the St. Lawrence River and into a single stream with BOD readings of up to 3000 ppm. Technicon Monitor IV's were used to monitor the acceptable streams. A single cell aerobic facultative or aerated lagoon was used to treat the high BOD waste. The lagoon was constructed by converting an old submerged canal in the St. Lawrence Seaway into a waste treatment plant with approximately 30 days retention time. The plant has operated with an 85-90% reduction of BOD during the summer months and 60-75% reduction during the colder months. The total program is responsible for an overall reduction of 85-90% in BOD to the St. Lawrence River. (See also W79-07849) (Small-FRC)
W79-07854

WASTEWATER TREATMENT AND OIL RECLAMATION AT GENERAL MOTORS, ST. CATHERINES,
General Motors of Canada Ltd., St. Catherines (Ontario).
R. E. Johnson, Jr.
In: Proceedings of the 23rd Ontario Industrial Waste Conference, held June 13-16, 1976, Toronto, Ontario, p 345-357. (1976) 2 fig, 2 tab.

Descriptors: *Oily water, *Reclamation, *Recycling, *Waste water treatment, Separation techniques, Regulation, Costs, Industrial wastes.

The operation of the Liquid Waste Treatment Plant located at the Axle Plant in St. Catherines, Ontario, is described. The plant treats over 270,000 gallons of liquid waste per day which consist of various oils, greases, washing chemicals, and process waters. The treatment plant separates petroleum products from the water phase via the acid-alum process. It removes pollutants from the water in compliance with Regional and Provincial laws. Also, it removes contaminants present in the separated oils and reclaims or recycles the oil back to the manufacturing plants. The chemically treated water is discharged to city sewers. Over 225,000 gallons of soluble oil concentrate and 100,000 gallons of cutting oil are produced annually at this plant at economical prices. Current experiments are described on the feasibility of formulating hydraulic oil from GM reclaimed oil. (See also W79-07849) (Small-FRC)
W79-07855

THE ROLE OF THE MINISTRY OF THE ENVIRONMENT IN THE DISPOSAL OF LIQUID INDUSTRIAL WASTE IN ONTARIO,
Ontario Ministry of the Environment, Toronto (Ontario). Pollution Control Branch.
E. W. Turner, and W. J. Hogg.
In: Proceedings of the 23rd Ontario Industrial Waste Conference, June 13-16, 1976, Toronto, Ontario, p 409-448. (1976) 6 tab.

Descriptors: *Waste disposal, *Industrial wastes, *Regulation, *Liquid wastes, Canada, Reclamation, Incineration, Landfills, Waste disposal wells, Ultimate disposal.

Actions by the Ministry of the Environment to control the problem of the disposal of liquid industrial wastes are reviewed including the way-bill system. The types and volumes of liquid wastes generated in Canada are tabulated. Using the way-bill system, the two parties to a disposal or transfer of liquid industrial waste are required to report independently to the Ministry. A voluntary way-bill system indicated that significant gains in the control and disposal of liquid industrial wastes could be achieved by making a regulation to document and control the movement of all liquid industrial wastes. Waste treatment and disposal technology is reviewed including: reclamation and/or recovery, re-use, incineration, incineration in cement kilns, deep-well disposal, solidification, landfilling, and treatment. (See also W79-07849) (Small-FRC)
W79-07856

PROCEEDINGS OF THE TWENTY-FIFTH SILVER ANNIVERSARY OF THE ONTARIO INDUSTRIAL WASTE CONFERENCE.
Held June 18-21, 1978 at Toronto, Ontario, (1978). 390 p. Ministry of the Environment, Ontario.

Descriptors: *Industrial wastes, *Pollution abatement, Filtration, Trickling filters, Dewatering, Creosote, Mining industry.

Twenty papers were presented at this conference on industrial waste abatement. Waste water treatment topics included ultrafiltration of oily water, a trickling filter for pretreatment of vegetable wastes, solidification of liquid industrial wastes, prevention of creosote contamination of groundwater, and the environmental controls practiced by Ontario's mining industry. 500 delegates attended the meetings. (See W79-07859 thru W79-07863) (Small-FRC)
W79-07858

MINING AND THE ENVIRONMENT - A QUARTER CENTURY IN REVIEW,
Ontario Mining Association, Toronto.
W. C. Ferguson.
In: Proceedings of the twenty-fifth Silver Anniversary of the Ontario Industrial Waste Conference, held June 18-21, 1978, Toronto, Ontario, p 2-21, (1978).

Descriptors: *Mineral industry, *Mining, *Mine water, *Mine wastes, Recycling, Waste water treatment, Heavy metals, Canada.

The environmental achievements of Ontario's mining industry are reviewed. More than 60 minerals are produced in about 300 operating mines in Canada; Ontario produces 40% or more than $2 billion in minerals each year. The three effluent disposal problems associated with mining are mine-water, tailings, and waste rock. Of the 193 million gallons of water per day used in Ontario mines, 111 million gallons are recycled. Treatment processes have reduced the heavy metals including copper, nickel, lead, and zinc discharged by the 53 active mines in Ontario to less than 1000 pounds per day. Reclamation and revegetation efforts are also reviewed. (See also W79-07858) (Small-FRC)
W79-07859

HYDROGEOLOGICAL CONTROL AND CLEAN-UP OF SOIL AND GROUNDWATER CONTAMINANTS AT NORTHERN WOOD PRESERVES, LTD,
G. E. Thompson.
In: Proceedings of the Twenty-fifth Silver Anniversary, Ontario Industrial Waste Conference, held June 18-21, 1978, Toronto, Ontario, p 250-268. (1978) 12 fig.

Descriptors: *Chemical industry, *Creosote, *Lake Superior, *Phenols, *Water quality control, Landfill, Runoff, Pilot plants, Activated carbon, Waste water treatment, Ozone.

Methods to prevent creosote contamination of Lake Superior by the Northern Wood Preservers, Ltd. plant in Thunder Bay are described. At the plant, wood products are treated with creosote, chromated copper arsenate, and pentachlorophenol. Some spilled creosote was washed directly into the lake by runoff, and the major portion infiltrated the landfill and moved laterally into the lake. The lake water had a high phenol content and creosote accumulated on the bottom. Northern Wood dredged the lake to remove the accumulated creosote. An investigation of the site led to the recommendation that well points be installed to prevent the movement of creosote to the lake. Pilot studies were conducted on the effluent which concluded that the most appropriate treatment for the effluent is ozonation or activated carbon. Two alternative treatment systems investigated consisted of an API separator, ozonation system, and gravity sand filter, or an API separator and a battery of activated carbon columns. (See also W79-07858) (Small-FRC)
W79-07860

PRETREATMENT OF VEGETABLE WASTEWATER AT THE H. J. HEINZ PLANT IN LEAMINGTON, ONTARIO,
Heinz (H. J.) Co. of Canada Ltd., Leamington (Ontario). Quality Assurance Dept.
D. Smit, and T. E. Eyre.
In: Proceedings of the Twenty-fifth Silver Anniversary of the Ontario Industrial Waste Conference, held June 18-21, 1978, Toronto, Ontario, p 269-275. (1978) 1 fig.

Descriptors: *Food processing industry, *Waste water treatment, *Trickling filters, *Packed beds, Aeration, Landfills, Biochemical oxygen demand.

Use of a roughing plastic media tower for the pretreatment of vegetable waste water is discussed. The waste water treatment plant consists of screening facilities, a 4 million gallon aeration basin with four 75 HP aerators and one 150 HP aerator, and a 1 million gallon circular clarifier. Sludge is concentrated and removed to a landfill. The tower was constructed to lower BOD during peak operations. It was constructed out of plastic media to a height of 12 ft, with an overall size of 32 x 32 ft. The total waste flow in the plant is kept below 3 million Imperial gallons per day and 25% of the flow is pretreated in the tower. With the new system, COD removal was only about 20% due to scouring by sand caused by machine-picked crops. A settling basin is being installed to remove the sand. More pretreatment towers are planned at this plant. (See also W79-07858) (Small-FRC)
W79-07861

TREATMENT AND RECOVERY OF EMULSIFIED OIL BY ULTRAFILTRATION,
Electrhome Ltd., Kitchener (Ontario).
G. Dhawan.
In: Proceedings of the Twenty Fifth Silver Anniversary of the Ontario Industrial Waste Conference, held June 18-21, 1978, Toronto, Ontario, p 276-291, 1978. 8 fig.

Descriptors: *Filtration, *Oily water, *Recycling, *Separation techniques, Waste water treatment, Costs, Emulsifiers.

An ultrafiltration plant is described which was developed by Electrohome Ltd., and which has been operating at Budd Automotive, Kitchener, Ontario, since 1976. The plant treats oil water from washers, and the oil concentration varies from 0-5%. The ultrafiltration system removes oil continuously and maintains a washer oil concentration under 5%. After settling, the concentrated oil has a final oil concentration of 70-90%. The water from the ultrafiltration system contains most of the emulsifiers used in the washers and it is recycled to the washers. A payback of less than two years is realized by savings in oil, elimination of waste disposal costs, and reduction in the washer clean-up. (See also W79-07858) (Small-FRC)

SOLIDIFICATION OF WASTES,

D. Krofchak.
In: Proceedings of the Twenty-fifth Silver Anniversary, Ontario Industrial Waste Conference, held June 18-21, 1978, Toronto, Ontario, p 378-390. (1978) 6 fig, 1 tab, 4 ref.

Descriptors: *Waste disposal, *Industrial wastes, *Landfills, *Leachate, *Dewatering, Heavy metals, Water pollution sources.

Solidification of wastes was evaluated on liquid wastes from various industrial sources. Industrial wastes were unloaded into either of two 125,000 gallon holding lagoons. A third 100,000 lagoon was used to blend waste prior to solidification treatment. Solidification was performed in 3500 gallon batches. Alkaline and silicate reagents were added to the waste in a blender, and the resulting slurry was fed to the reaction tank. The solidified product was cured for several days and then removed to a landfill. The stability of 10 solidified samples was evaluated with respect to environmental attack by aqueous solutions in a series of 25 leaching tests. Column leaching flow tests were run for 8-26 days while constant volume leaching tests were run for 9-13 days. Concentration of heavy metals was generally less than 1 ppm for individual metals. These elements include Cd, Co, Cr, Cu, Fe, Mn, Mo, Ni, Pb, Ti, V, and Zn. (See also W79-07858) (Small-FRC)

CONFERENCE ON MUSKEGON COUNTY, MICHIGAN WASTEWATER SYSTEM, SEPTEMBER 17-18, 1975, A CRITICAL REVIEW ON EVALUATIONS OF THE SYSTEM AND IDENTIFICATION OF NEEDED RESEARCH,
Available from the National Technical Information Service, Springfield, VA 22161 as PB-263 552, Price codes: A09 in paper copy, A01 in microfiche. Report EPA-905/9-76-006, 1976. 178 p.

Descriptors: *Irrigation systems, *Experimental farms, *Performance, *Waste water treatment, Municipal wastes, Industrial wastes, Design, Costs, Agricultural engineering, Michigan.

The Muskegon County waste water treatment system was reviewed and evaluated. The operation of the municipal-industrial collection system, an aeration system, holding lagoons, and a spray irrigation system are discussed. Progress is outlined from 1969 through 1975. Topics discussed include agricultural engineering, agricultural management of waste water utilization, soil monitoring, and modeling and economic studies. Participants included principal investigators and government representatives. (See W79-07865 and W79-07866) (Small-FRC)
W79-07864

REVIEW OF SYSTEM DESIGN PARAMETERS,
Bauer (W. J.) Consulting Engineers, Chicago, IL.
W. J. Bauer.
In: Conference on Muskegon County, Michigan Wastewater System, September 17-18, 1975, A Critical Review on Evaluations of the System and Identification of Needed Research, p 44-55. 1976.

Descriptors: *Irrigation systems, *Experimental farms, *Design, *Performance, Land clearing, Municipal wastes, Waste water treatment, Costs, Biochemical oxygen demand, Michigan.

The Muskegon County waste water irrigation project experiences during startup are described and related to the original design considerations. The flow was estimated to average 28.5 MGD which was very near the actual flow. BOD is somewhat less than that assumed in the design resulting in less demand than expected for aeration. Problems were encountered with failures in insulation of buried electrical cables, with failures of asbestos cement pressure pipes, and with clogging of nozzles with vegetation and sand. Most of the problems were caused by substandard workmanship, although some are related to design criteria. Problems were also encountered with the clearing of trees, because air pollution regulations made burning of the cleared trees impossible. The water quality objectives of the system were accomplished. In 1975, operating costs were forecast to be $1.4 million to be offset by a crop sales revenue of about $1 million. The net cost per gallon treated would then be $40 per million gallon. (See also W79-07864) (Small-FRC)

PERFORMANCE AND ECONOMICS OF THE SYSTEM,
Muskegon County Wastewater Management System, MI.
Y. A. Demirjian.
In: Conference on Muskegon County, Michigan Wastewater System, September 17-18, 1975, A Critical Review on Evaluations of the System and Identification of Needed Research, p 56-72. 1976 3 fig, 11 tab.

Descriptors: *Irrigation systems, *Experimental farms, *Biochemical oxygen demand, *Nitrogen, *Performance, Phosphate, Coliforms, Costs, Municipal wastes, Waste water treatment, Michigan.

The Muskegon, Michigan waste water treatment system which utilizes land application at an 11,000 acre site, is evaluated. The system reduces BOD over 98% and COD drops from 550 ppm to 30-40 ppm. This reduction occurs during storage and aeration. Total nitrogen is reduced from 15 ppm to 2.5 ppm, and phosphate is reduced by 97%. The systems meets NPDES discharge limits except for fecal coliform. This is thought to be due to contamination by waterfowl. Actual costs for aeration were $216,000, for storage were $62,000, and for irrigation were $250,000 per year. Problems were encountered with sand and vegetation clogging of irrigation nozzles. A sump will be added to remove sand and screens will be used to eliminate vegetation and other debris. The crop yield in 1975 was double 1974 levels. (See also W79-07864) (Small-FRC)

SCREENING/FLOTATION TREATMENT OF COMBINED SEWER OVERFLOWS. VOLUME I - BENCH SCALE AND PILOT PLANT INVESTIGATIONS,
Envirex, Inc., Milwaukee, WI.
M. K. Gupta, D. G. Mason, M. J. Clark, T. L. Meinholz, and C. A. Hansen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 834, Price codes: A13 in paper copy, A01 in microfiche. Report EPA-600/2-77-069a, 1977. 295 p, 38 fig, 117 tab, 71 ref, 6 append.

Descriptors: *Screens, *Flotation, *Combined sewers, *Overflow, Outfall sewers, *Pilot plants, Suspended solids, Biochemical oxygen demand, Chemical oxygen demand, Waste water treatment, Municipal wastes.

The treatment of combined sewer overflows by a combined screening and dissolved-air flotation system was evaluated in laboratory tests and in two 5 mgd pilot plants. Laboratory tests evaluated chemical oxidation, screening, dissolved-air flotation, and disinfection as treatments for combined sewer overflows containing particulate pollutants; chemical oxidation was not considered feasible. A pilot screening and dissolved-air flotation facility incorporating one drum screen was established at an outfall and handled a total of 63 combined sewer overflows. The pilot plant achieved BOD, COD, and suspended solids removals in the range of 60-75%. Another sequential screening plant with three drum screens in series was also operated at the outfall and accomodated 21 combined sewer overflows. The plant achieved about 30% reduction of suspended solids, volatile suspended solids, BOD, COD, and total organic carbon. No significant improvements in removal efficiencies were observed when chemical flocculants were added or when the hydraulic and solids loadings varied. No significant improvements were obtained in the screening/flotation plant when it was operated in an effluent flow pressurization mode or with powdered activated carbon. Removal efficiency was improved by 5-10% when the effluent was polished with 22 micron microscreening. (Lisk-FRC)

SEPARATION OF ALGAL CELLS FROM WASTEWATER LAGOON EFFLUENTS, VOL. III: SOIL MANTLE TREATMENT OF WASTEWATER STABILIZATION POND EFFLUENT - SPRINKLER IRRIGATION,
Utah Water Research Lab., Logan.
B. T. Hicken, R. S. Tinkey, R. A. Gearheart, J. H. Reynolds, and D. S. Filip.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-292 537, Price codes: A11 in paper copy, A01 in microfiche. Report EPA-600/2-78-097, 1978. 233 p, 33 fig, 30 tab, 100 ref, 3 append.

Descriptors: *Waste water treatment, *Land use, *Irrigation practices, *On-site investigations, *Performance, Lysimeters, Leaching, Suspended solids, Nitrates, Phosphorus, Ammonia, Application methods, Coliforms, Utah.

The efficiency of sprinkler irrigation wastewater treatment was evaluated by lysimeter studies and a two-year field study as a means of polishing waste water stabilization lagoon effluent. In the lysimeter study, four Utah soils were evaluated for their effectiveness in removing total coliform and fecal streptococcal organisms as well as nitrogen, phosphorus, and carbon compounds. The removal efficiencies for carbon, nitrogen, and phosphorus compounds were evaluated in field experiments. All four soils were found to be effective in removing three indicator organisms, organic compounds, and suspended solids. Leaching of salts from soils occurred during the field experiments on a drainage farm. The characteristics of the drainage farm system appeared to control the quality of the effluent. Superior quality is expected once equilibrium is established. In the field experiments, phosphorus removal exceeded 80%. The rate of waste water application made no significant difference in the phosphorus removal rate. There was evidence of nitrate leaching from the soil. Ammonia stripping removed about 35% of the ammonia when the lagoon effluent was sprayed on the land. Excellent suspended solids removal was effected by the soil mantle treatment system. The suspended solids concentrations in the drainage water from a 1.2 m deep mole drain contained an average suspended solids concentration of 2 mg/liter. (Small-FRC)

DESTROYING CHEMICAL WASTES IN COMMERCIAL SCALE INCINERATORS. FACILITY REPORT NUMBER 3 - SYSTEMS TECHNOLOGY,
TRW Defense and Space Systems Group, Redondo Beach, CA.
D. G. Ackerman, J. F. Clausen, R. J. Johnson, and C. A. Zee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 540, Price codes: A05 in paper copy, A01 in microfiche. Report, 1977. 96 p, 13 fig, 39 tab, 4 ref, 4 append.

Descriptors: *Chemical wastes, *Phenols, *Incineration, *Ultimate disposal, *Aqueous solutions, Cost analysis, Capital costs, Operating costs, Industrial wastes, Waste water treatment.

The incineration of two liquid industrial waste streams in a fluidized bed incinerator was evaluated. The waste streams were an aqueous phenol sludge and an aqueous solution of methyl methacrylate monomer. The effects of operating and equipment variables were determined by performing the incinceration tests at two different flow rates. The process achieved a destruction efficiency of more than 99.999% of each waste material, as indicated by the analysis of combustion gas samples. No organics could be detected in the scrubber water or ash and stack emissions were analyzed for particulate loading and composition.

capital cost of $6 million and an operating cost f $255/metric ton were estimated for destroying 3.2 million liters/yr of aqueous methyl methacryte. Incineration of 23.8 million liters/yr of aqueus phenol waste would cost an estimated $6 million capital investment and $124/metric ton operatg cost. (Lisk-FRC)

DESTROYING CHEMICAL WASTES IN COMMERCIAL SCALE INCINERATORS. FACILITY REPORT NUMBER 1 - THE MARQUARDT COMPANY,
TRW Defense and Space Systems Group, Redono Beach, CA.
F. Clausen, R. J. Johnson, and C. A. Zee.
Available from the National Technical Information ervice, Springfield, VA 22161 as PB-265 541, rice codes: A06 in paper copy, A01 in microfiche. eport, 1977. 127 p, 27 fig, 39 tab, 4 append.

Descriptors: *Chemical wastes, *Incineration, *Ulmate disposal, *Aqueous solutions, *Effluent treams, Cost analysis, Capital costs, Operating osts, Waste water treatment, Industrial wastes.

The incineration of two liquid industrial waste treams, ethylene manufacturing waste and exachlorocyclopentadiene (C-5,6) was investigatd. The ethylene wastes were combusted at three ifferent temperatures while the C-5,6 wastes, hich required auxiliary fuel for incineration, were urned at three different fuel/waste ratios to deterine the effects of normal operating and equipent variables. Destruction efficiencies of more han 99.999% were achieved for each waste conituent. No increase in organics was detected in he scrubber water. Particulate loading and comosition of the stack emissions were analyzed with Standard EPA Method 5 tests. No chlorinated rganics were found in the burner head residue ormed during incineration of the wastes. Liquid njection incineration of the wastes was considered ffective, but rotary kiln incineration was considred more suitable for C-5,6 waste because of tarry esidual. A capital cost of $1.8 million and an nnual operating cost of $1.0 million were estimatd for the destruction of an annual load of 15 million kg of ethylene waste. Incineration of 4.5 million kg/yr of C-5,6 would cost an estimated 1.6 million capital investment and $2.2 million/yr perating costs. (Lisk-FRC)

PHYSICAL, CHEMICAL, AND BIOLOGICAL TREATMENT TECHNIQUES FOR INDUSTRIAL WASTES. VOLUME 1,
Little (Arthur D.), Inc., Cambridge, MA.
J. B. Berkowitz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-275 054, Price codes: A21 in paper copy, A01 in microfiche. Report, 1977. 474 p, 56 fig, 76 tab, 406 ref.

Descriptors: *Treatment, *Industrial wastes, *Evaluation, *Performance, *Biological treatment, Adsorption, Catalysts, Centrifugation, Chlorination, Dialysis, Distillation, Electrodialysis, Electrolysis, Electrophoresis, Freeze drying, Waste water treatment.

The suitability of 47 unit engineering processes in the treatment of hazardous industrial wastes was investigated. Some of the treatment processes are already in use while others require further research and development before they will be commercially attractive. Descriptions of the unit processes and data on their basic principles, areas of application, economics, energy and environmental considerations, and the future outlook for use on industrial wastes are provided. The treatment processes in this volume include 2 adsorption processes, 7 biological treatments, calcination, catalysis, centrifugation, chlorinolysis, dialysis, dissolution, distillation, electrodialysis, electrolysis, and electrophoresis. Process evaluations are continued in Volume II of the report. Dialysis, electrophoresis, freeze drying, and zone refining were not suitable for the treatment of hazardous industrial wastes. (Lisk-FRC)

HIGHLIGHTS OF THE CLEAN WATER ACT OF 1977,
M. P. Kerner.
Environmental Law, Vol. 8, No. 2, p 869-85, 1978.

Descriptors: *Federal water pollution control act, *Federal government, *Water pollution, Dredging, Oil spills, Industries, Waste water treatment, Taxes, Sewage treatment, Industrial wastes.

Amendments to the 1972 Federal Water Pollution Control Act Amendments (FWPCA), passed by Congress on December 15, 1977, were signed by President Carter on December 28, 1977. The amendments change the name of the FWPCA to the 'Clean Water Act' and reconcile the conflicting provisions of the House and Senate bills. The amendments are basically revisional, allowing for some flexibility in meeting various requirements and time limits of the FWPCA. Those areas where deadlines have been extended are identified: (1) 1977 'Best Practicable Control Technology Currently Available' deadline extensions for industrial dischargers; (2) 1977 secondary treatment deadline extensions for municipal waste treatment facilities; and (3) 1983 'Best Available Technology Economically Achievable' deadline extension for industrial dischargers. Also identified and discussed are new provisions in the following areas: (1) Army Corps of Engineers jurisdiction over dredge and fill materials; (2) Federal facility compliance; (3) oil spill liability; (4) best management practices for industry; (5) irrigation return flows:; (6) secondary treatment requirements for municipal waste treatment dischargers; (7) funding authorization for existing sewer system rehabilitation; (8) federal funding for individual waste treatment facilities; (9) ad valorum taxes; and (10) alternative waste treatment. THE RISING COSTS OF MINE DRAINAGE ABATEMENT,
Maryland Dept. of Natural Resources, Annapolis. Energy and Coastal Zone Administration.
A. F. Abar.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 109-111. Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2.

Descriptors: *Coal mine wastes, *Mine drainage, *Acid mine water, *Water pollution sources, *Pollution abatement, *Costs, Capital costs, Estimates costs, Water pollution treatment, Abatement, Water quality control, Water purification, Georges Creek River basin project(Maryland).

Acid mine drainage (AMD) continuously impacts about 4,275 miles of the Susquehanna, Allegheny, Delaware, Monongahela, and Potomac River basins. In considering abatement program costs, statistics concerning mine drainage sources are more important than those concerning the extent of AMD. Abandoned mines produce 80% of all AMD in the Appalachian Region, and more than 80% of the AMD from all abandoned mines is produced by deep abandoned mines. The solutions and costs are complex, and demonstrate the need for a publicly funded AMD pollution abatement program. According to a 1969 study conducted by the Appalachian Regional Commission, the capital costs of controlling AMD are estimated at $6.6 billion. Abatement program costs are incurred before project construction is actually intiated, because field reconnaissance is necessary to locate AMD sources from deep abandoned mines. The Georges Creek River basin project in Allegheny and Garrett Counties in Maryland is discussed as an example of the complexity of the abatement program. Techniques developed to eliminate or reduce AMD are generally preventive measures to inhibit AMD formation, or treatment measures which capture and treat AMD after its formation and discharge from the mine. Current mining operations are eliminating many abandoned mine problems by mining and reclaiming adjacent areas; this includes daylighting deep mines and reclamation of surface-mined land. Recent legislation passed in Maryland imposes a 15 cent per ton surcharge on all coal mined in the State, which provides a cash flow to cover recurring costs. (Davison-IPA)

5E. Ultimate Disposal Of Wastes

LONG-TERM EFFECTS OF LAND APPLICATION OF DOMESTIC WASTEWATER: HOLLISTER, CALIFORNIA, RAPID INFILTRATION SITE,
Metcalf and Eddy, Inc., Palo Alto, CA.
C. E. Pound, R. W. Crites, and J. V. Olson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-283 405, Price codes: A08 in paper copy, A01 in microfiche. Report No. EPA-600/2-78-084, April 1978. 166 p, 42 fig, 64 tab, 96 ref, 3 append. 68-03-2361.

Descriptors: *Waste water disposal, *Infiltration, *Percolation, Trace elements, Groundwater recharge, Soil chemistry, Flooding, Effluents, Municipal wastes, Liquid wastes, Water table, Infiltration galleries, Settling basins, Hollister(California).

The effects of more than 30 years application of primary treated municipal waste water to a rapid infiltration site were evaluated by analyzing groundwater and soil chemistry at the site. The current daily flow at the Hollister, California, infiltration basins is 43.8 L/s (1.0 M gal/day). The 20 infiltration basins are flooded for one to two days every 14 to 21 days, depending on the size of the basin and the season; annual waste water application equal 15.4 m, or 51 ft/basin. Water table response to the applications was monitored, infiltration rates were determined, and subsurface hydrology was logged. Samples from the one-year analysis program included: (1) primary effluent, (2)

on-site and control site soil profiles, (3) groundwater at the site and upgradient and downgradient of groundwater movement from the site. Results of the primary effluent and groundwater analyses indicated that percolation through 22 ft of unsaturated gravelly, sandy loam effectively reduced COD, BOD, TOC, nitrogen, and fecal coliform bacteria. Although effective phosphorus removal required longer travel distances, the soil sorption capacity has not been exceeded. Soil retention of trace elements was low, and only lead exceeded EPA drinking water limits in the waste water and the shallow groundwater aquifer. Slight boron removal in the percolate was observed; iron and manganese are being leached from the soil with the percolating waste water. (Davison-IPA)

ORGANIC COMPOUNDS IN ORGANOPHOSPHORUS PESTICIDE MANUFACTURING WASTEWATERS,
Midwest Research Inst., Kansas City, MO.
M. Marcus, J. Spigarelli, and H. Miller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 821, Price codes: A07 in paper copy, A01 in microfiche. Report No. EPA-600/4-78-056, September 1978. 141 p, 55 fig, 22 tab, 9 ref, 2 append. 68-03-2343.

Descriptors: *Organophosphorus pesticides, *Organic pesticides, *Industrial wastes, *Pesticide removal, *Waste water treatment, Waste treatment, Effluents, Water pollution sources, Water pollution, Water quality, Water quality control, Liquid wastes, Organic compounds.

The nature of organophosphorus pesticide manufacturing plant effluents was studied to develop preliminary survey information on the waste water streams of this industry, and to develop analytical methods for monitoring compound levels present in these streams. In addition to identifying and quantifying organophosphorus compounds, nonphosphorus chemicals were included in the survey. Samples of diazinon, methyl parathion, azinophosmethyl and disulfoton, fonofos, phosmet and bensulide, and EPN were taken at pre-, mid-, and post-treatment locations from five pesticide plants. These samples were analyzed utilizing extraction and partitioning, gas chromatography with specific element detection, thin-layer chromatography, infrared spectroscopy, and gas chromatography/mass spectrometry. Among the 116 compounds identified were: organophosphorus pesticides, related organophosphorus esters, organophosphorus acids, thiocarbamate pesticides, and triazine herbicides. Final effluent levels of organophosphorus pesticides were generally below 0.005 mg/liter, indicating effective removal by the waste treatment systems studied. Oxygen analogs of the pesticides were not a significant degradation product of any of the treatment processes. Organophosphorus acids were only partially removed by the treatment systems, and methyl phosphorothioates actually increased in concentration during treatment, possibly indicative of biomethylation of phosphorothioic acids. (Davison-IPA)

ASSESSMENT OF LOW-GROUND-PRESSURE EQUIPMENT FOR USE IN CONTAINMENT AREA OPERATION AND MAINTENANCE,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
W. E. Willoughby.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A058 501, Price codes: A06 in paper copy, A01 in microfiche. Technical Report DS-78-9, July 1978. 106 p, 11 fig, 3 ref, 2 append.

Descriptors: *Equipment, *Operation and maintenance, *Dredged material disposal, *Containment areas, *Low-ground-pressure equipment, Soft soils.

Guidelines for the selection of equipment to operate in and around confined dredged material disposal areas were developed as part of the Dredged Material Research Program (DMRP). In the early phase of the DMRP, it was recognized that, in order to implement concepts for management of disposal areas to minimize adverse environmental impacts, equipment must be employed that can operate on very soft soils. In a three-phase study, guidelines were developed (a) compiling a catalog of low-ground-pressure equipment, (b) analytically predicting vehicle performance, and (c) verifying the predictions of the field condition. This report is a synthesis of the three studies. The equipment catalog is included as Appendix A. Guidance for performing required soils tests is contained in Appendix B. (WES)

THE AGRICULTURAL VALUE OF DREDGED MATERIAL,
Science and Education Administration, St. Paul, MN. North Central Region.
S. C. Gupta, W. E. Larson, R. G. Gast, S. M. Combs, and R. H. Dowdy.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A061 298, Price codes: A08 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-36, July 1978. 165 p, 44 fig, 26 tab, 74 ref, 3 append.

Descriptors: *Agricultural engineering, Agriculture, *Dredged material, Sediment analysis.

To study the suitability of dredged material for crop production, 10 dredged material samples and 10 marginal soil samples were collected from locations in the United States. The soils were marginal for crop production and were of such character that additions of dredged material might improve their physical and chemical properties. The soils and dredged material samples were dried, ground, and mixed for plant growth studies and laboratory analysis. These treatments were prepared: (a) soil alone; (b) 1/3 soil and 2/3 dredged material; (c) 2/3 soil and 1/3 dredged material; and (d) dredged material alone. Three productive soils were chosen from the St. Paul, Minn., area as controls. Three cuttings of ryegrass and two crops of barley were harvested from each treatment. Greenhouse yields were greater for all fine-textured dredged material samples compared to coarse-grained marginal soils. Results show that the dredged material used in this study may increase agricultural production when mixed with marginal soils. Relationships between uptake and the availability of various soil elements were developed for setting the ratio of dredged material to marginal soil used in the field. Physical and chemical data, along with plant growth data, were used to develop guidelines for disposing dredged material on marginal soils. (WES)

EFFECTS OF SUSPENDED DREDGED MATERIAL ON AQUATIC ANIMALS,
California Univ., Bodega Bay. Bodega Marine Lab.
R. K. Peddicord, and V. A. McFarland.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A058 489, Price codes: A06 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-29, July 1978. 115 p, 3 append, 11 tab, 39 fig, 55 ref.

Descriptors: *Aquatic animals, *Suspended load, Sediments, *Dredged material.

Evaluates the impact of suspensions of relatively uncontaminated and contaminated harbor sediments on juvenile and adult marine, estuarine and freshwater fish and invertebrates. Studies of survival and tissue accumulation of contaminants were conducted for 21 days exposure to suspended sediments in a flow-through aquarium system. Even the most sensitive fish survived days of continuous exposure to suspensions of relatively uncontaminated sediment on the order of grams per litre, and the invertebrates generally survived similar exposures to tens of grams per litre of relatively uncontaminated sediment. Exposure to suspensions of contaminated sediment decreased survival substantially, but mortality occurred only after exposure to higher concentrations for longer time periods than are created in the water column by the typical dredging operation. Only fingerling striped bass Morone saxatilis showed a sensitivity great enough to indicate potential cause for concern from continuous pipeline discharge of highly contaminated dredged material. While water column impacts appeared to warrant little concern, data indicate potential for impact of contaminated fluid mud on benthic infauna and relatively immobile epifauna. Fluid muds with suspended sediment concentrations of tens of grams per litre can persist for sufficient periods to have potential impact on immobile bottom dwellers. (WES)

FIELD INVESTIGATIONS OF THE NATURE, DEGREE, AND EXTENT OF TURBIDITY GENERATED BY OPEN-WATER PIPELINE DISPOSAL OPERATIONS,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
J. R. Schubel, H. H. Carter, R. E. Wilson, W. M. Wise, and M. G. Heaton.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A058 507, Price codes: A14 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-30, July 1978. 297 p, 4 append, 130 fig, 37 tab, 66 ref.

Descriptors: *Turbidity, Suspended solids, *Dredged material, *Dredged material disposal, *Open water disposal, Plumes, Environmental effects.

Characteristics of turbidity plumes near open-water pipeline disposal operations are evaluated. Distribution and concentration of dissolved heavy metals, nutrients, and dissolved oxygen also are evaluated. Based on field studies at Corpus Christi Bay, Texas, Atchafalaya Bay, Louisiana, and Apalachicola Bay, Florida, a simple model was developed to predict 61 spatial and temporal distributions of suspended solids in turbidity plumes. No well-defined plumes of dissolved metals were observed at sites, indicating dissolution of metals from suspended solids was limited. Increased concentrations of suspended solids and particle-associated metals in receiving waters was associated with discharge plume. Concentrations of dissolved ammonia and silica increased near discharge; however, no increases in dissolved phosphate were noted, despite high dissolved phosphate concentrations in interstitial water of channel sediment being dredged. Elutriate test results using channel sediment had limited use predicting changes in concentrations of dissolved metals during open-water disposal operations. A simple model was developed to predict concentrations of particle-associated constituents. Although large quantities of reduced sediment with high oxygen demand enter the water column during open-water pipeline disposal operations, little is reactive on a time scale comparable to that associated with majority settling of dredged material slurry. ts, *Dredged material, *Habitat development.

his study of terrestrial wildlife habitat develop-
ent on dredged material within the contiguous
nited States compiles existing published and un-
blished data into a user-oriented handbook. A
neral list of 250 plant species with food and
ver value for wildlife is indexed by life form and
ate; a synopsis is given for each of 100 plant
ecies chosen from the general list on the basis of
eir importance to wildlife, ease of establishment,
d geographic distribution. Each synopsis in-
udes a description and discussion of habitat, soil
quirements, establishment and maintenance, dis-
se and insect problems, and wildlife value. A
nge map and illustrations are given along with
propriate miscellaneous comments. The hand-
ok also outlines a suggested approach for devel-
ing terrestrial wildlife habitat on dredged mate-
l; discusses wildlife species inhabiting dredged
aterial areas; and recommends techniques for
opagation, establishment, and maintenance of
antings. (WES)

escriptors: *Mud, *Dispersion, Turbidity,
Mobile Bay(Ala), *James River(Va), *Fluid mud,
Dredged material, *Open water disposal.

pen-water disposal of dense suspensions of fluid
ud with concentrations of 10 to 480 g/l was
udied at field sites in Mobile Bay, Alabama, and
e James River, Virginia. The significance of fluid
ud in dispersal of dredged material and in genera-
on of turbidity was examined. The bulk of the
edged material, more than 99 percent at the
obile Bay site, was dispersed in the form of fluid
ud near the bottom, whereas less than 1 percent
as dispersed through the water column. As sus-
nded solids flocculate and settle, they contribute
the fluid mud. In turn, fluid mud resists resu-
ension and reduces turbidity. Disposal created a
eposit spread over an area 5 to 13 times the
edged area in the channel. Disposal raised the
d, forming dense layers in mounds 0.8 to 2.2 m
gh having slopes 1:125 to 1:2000. After disposal,
e fluid mud consolidated, bulk density increased,
d slopes decreased. Height and volume of the
mes River mound decreased about 50 percent in
year. More field investigations of the movement of fluid mud are needed for a detailed understanding of its dynamics. (WES)

HABITAT DEVELOPMENT FIELD INVESTIGATIONS, PORT ST. JOE SEAGRASS DEMONSTRATION SITE, PORT ST. JOE, FLORIDA; SUMMARY REPORT,
Seattle Pacific Univ., WA.
R. C. Phillips, M. K. Vincent, and R. T. Huffman.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A058 733, Price codes: A04 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi. Technical Report D-78-33, July 1978. 52 p, 7 tab, 5 fig, 1 app, 20 ref.

Descriptors: *Habitats, Plant growth, *Dredged material, *Seagrasses, *Habitat development, *Port St. Joe(Fla.).

Transplants of shoal grass (Halodule wrightii) at Port St. Joe, Florida, indicate that it may be feasible to propagate seagrass on dredged material. Using the plug technique, two sizes of plugs were removed from a natural meadow and planted on coarse-grained dredged material at three different spacing intervals. Many of the transplants demonstrated a siginificant amount of growth before the project failed nearly 13 months after planting. Best growth was obtained with 375-cm2 plugs planted on 0.9-m centers. The reason for the project failure is not known, but it is hypothesized that the factors involved included stresses from an unusually cold winter, exposure, erosion, sedimentation, variation in water quality, and heavy surf. While the study indicates that seagrass propagation on dredged material has promise, further field study is needed. (WES)

COST OF LANDSPREADING AND HAULING SLUDGE FROM MUNICIPAL WASTEWATER TREATMENT PLANTS. CASE STUDIES,
Environmental Protection Agency, Washington, DC. Office of Solid Waste.
R. K. Anderson, B. R. Weddle, and T. Hillmer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 875, Price codes: A08 in paper copy, A01 in microfiche. Report EPA/530/SW-619, 1977. 149 p, 13 fig, 6 tab, 1 append.

Descriptors: *Ultimate disposal, *Municipal wastes, *Sludge disposal, *Costs, *Dewatering, Filtration, Waste water treatment, Personnel, Agricultural, Land use, Application methods.

The cost of disposing of municipal wastewater treatment sludge on land by existing operations was investigated by an on-site survey of 24 communities. The municipal plants surveyed were small to medium in size with throughputs of less than 100 mgd. A cost analysis indicated that landspreading liquid sludge was far less expensive than landspreading sludge dewatered by vacuum filtration. Communities that disposed of liquid sludge had an average cost of $32.00 per dry ton, while those that dewatered their sludge averaged $87.00 per dry ton. Personnel costs represented the largest single cost item for both liquid and dewatered sludge landspreading. Liquid sludge was more acceptable to farmers than dewatered sludge because the municipality spread the liquid sludge. Dewatered sludge was more difficult to spread. (Small-FRC)

ON-LAND DISPOSAL OF MUNICIPAL SEWAGE SLUDGE: A GUIDE TO PROJECT DEVELOPMENT (INTERIM REPORT),
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
M. H. Lutkin, J. L. Smith, and D. B. McWhorter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 144, Price codes: A07 in paper copy, A01 in microfiche. Report NSF/RA-770165, 1977. 151 p, 12 fig, 14 tab, 93 ref, 2 append.

Descriptors: *Sewage sludge, *Sludge disposal, *Land management, *Application methods, *Treatment facilities, Design criteria, Design data, Project planning, Municipal wastes.

A technique for planning a land application facility for municipal sewage sludge disposal was developed. A literature review of pertinent background material included an overview of permits and approval processes; pathogenic microorganisms; inorganic and organic contaminants; potential surface conditions at a field location; a discussion of potential subsurface conditions, including groundwater and soil water movement, soil properties, and procedures for obtaining data; and the impact of climate and sludge application on operation. Important factors in project development were identified and practical data from existing operations were utilized to provide guidelines for site selection, overall design, and monitoring techniques. The application of the data by a designer or administrator for developing a land application facility was demonstrated with a hypothetical project. (Lisk-FRC)

ASSESSMENT IN INDUSTRIAL HAZARDOUS WASTE MANAGEMENT PETROLEUM RE-REFINING INDUSTRY,
J. W. Swain.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 267, Price codes: A08 in paper copy, A01 in microfiche. Report, 1977. 160 p, 3 fig, 44 tab, 30 ref, 6 append.

Descriptors: *Oil industry, *Landfills, *Leachate, *Neutralization, *Cooling water, Sludge, Lead, Zinc, Phenols, Waste disposal, Waste water treatment, Industrial wastes.

Waste management practices in 27 petroleum rerefining plants which generate lubricants and fuels from waste oils are reviewed. The rerefining process utilizes pretreatment with heat and chemicals, distillation with bleaching clay, and post treatment with filtration and acid neutralization. Wastes generated by these processes include acid or caustic sludges and spent clay wastes. Sources of waste water include water in raw waste which settles during storage, groundwater runoff containing oil

from spills and leakage, process cooling water, and steam stripping water. The latter waste water is considered the most hazardous, containing lead, zinc, phenols, and hexane solubles. Treatment and disposal techniques practiced by the industry include the use of on-site or off-site landfills without treatment of wastes, landfilling with prior acid neutralization or fixative material treatment, or the use of chemically secure landfills with or without waste treatment. Projections for production of rerefined oil and production of wastes were made for 1977 and 1983. (Lisk-FRC)

UTILIZATION OF SOIL INVERTEBRATES IN STABILIZATION, DECONTAMINATION, AND DETOXIFICATION OF RESIDUAL SLUDGES FROM TREATMENT OF WASTEWATER (INTERIM REPORT),
State Univ. of New York Coll. of Environmental Science and Forestry, Syracuse. School of Biology, Chemistry and Ecology.
R. Hartenstein, and M. J. Mitchell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 141, Price codes: A07 in paper copy, A01 in microfiche. Report NSF/RA-770138, 1977. 133 p, 5 fig, 15 tab, 45 ref, 11 append.

Descriptors: *Sludge treatment, *Biological treatment, *Organic matter, *Worms, *Degradation, Odor, Toxicity, Salmonella, Nematodes, Stabilization.

The problem of reducing organic matter content in sludge without destroying the biological value of sludge to the soil ecosystem was reviewed. Earthworms may be used to convert a relatively infertile sludge into a fertile, organic topsoil. In combination with nematodes, bacteria, and other microorganisms, earthworms can deodorize soil, destroy salmonella, and reduce the unstable organic content of sludges. Research projects are reviewed on the following topics: sludge toxicity to earthworms, degradation and stabilization of sludge, modification of certain chemical properties of sludge, effect of soil macroinvertebrates on bacterial and nematode populations, and effect of earthworms on salmonella typhimurium. Reports of various studies constitute the bulk of this document. (Small-FRC)

SLUDGE INCINERATION SYSTEMS FOR PURIFICATION AND RESOURCE RECOVERY,
Envirotech Corp., Menlo Park, CA.
F. P. Sebastian.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 8-26, 1975. 10 fig, 8 ref.

Descriptors: *Sewage sludge, *Incineration, *Reclamation, *Polychlorinated biphenyls, *Drying, Oxidation, Heat treatment, Sludge disposal, Ultimate disposal, Waste water treatment, Sewage treatment, Sludge treatment, Municipal wastes.

The use of multiple hearth furnaces for the incineration or drying of various municipal sludges is discussed. Multiple hearth furnaces may also be used for burning or drying raw sludge, digested sludge, and sewage greases; recalcining lime sludge and waste pond sludge; reclaiming various industrial wastes; regenerating spent activated carbon and diatomaceous earth. The multiple hearth furnace is a refractory containing a series of hearths; in the upper hearths, the feed is dried to about 48% moisture, in the incineration/deodorization zone, the temperature is maintained at 760-982C, and in the cooling zone, hot ash contributes its heat to incoming combustion air. Tests for polychlorinated biphenyl (PCB) destruction in incinerated sludge indicated that at 371C, 95% PCB destruction was achieved at 0.1 sec exhaust gas detention time and at 593C, 99.9% destruction was achieved at the same detention time. The importance of PCB destruction is reviewed and the impacts of incineration on air quality are discussed. The incineration of certain sludges also permits the reclamation of lime and/or energy and the recovery of ash as a fertilizer. Costs associated with thermal oxidation of sludges are discussed. W79-07827

MANAGEMENT OF OIL SLUDGE FROM A REFINERY WASTE WATER TREATMENT PLANT,
Bashkirian Scientific Research Inst. of Petroleum Refining (USSR).
E. G. Ioakimis, and A. D. Davletov.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 27-35, 1975. 6 fig.

Descriptors: *Incineration, *Oil wastes, *Sludge treatment, *Oil industry, *Sludge disposal, Pilot plants, Industrial wastes.

Systems currently employed in the USSR for the incineration of oil sludge from refineries are described. Pilot plant studies of rotary drum kiln incinerators indicated that combustion is incomplete with about 28% of the non-combusted materials exhausted with the off-gases. Furnaces with bubble burners are considered simple and operate by separating water from the sludge prior to incineration in the kiln. These furnaces are capable of incinerating aged emulsions and oil sludges containing up to 5% solids and 35-40% petroleum products but lack ash-catching facilities. In fluid-bed incinerators, the sludge is pretreated and incinerated in a sand fluid bed of a vertical kiln where mechanic burners atomize fuel, oil sludge and cooling water. However, air temperatures of 600C for fluidization are required to provide normal operation of the incinerator with oil sludges and problems have been encountered attempting to improve the efficiency of the system. In an incinerator which was modified from a fluid bed to torch burning under the use of a rotary burner, the sludge intake and pretreatment, the sludge feed to the incinerator, and its atomizing, cooling off-gases were modernized. The modifications to the system permitted an average capacity of 2.7 tons/hr with a maximum capacity of 4 tons/hr when incinerating sludge containing 25-27% petroleum products and 5-10% solids. The flow diagram for the system is illustrated. (See also W79-07825) (Lisk-FRC)

MODERN STATE AND PRINCIPAL TRENDS IN TECHNOLOGY DEVELOPMENT FOR WASTEWATER SLUDGE TREATMENT,
Vsesoyuznyi Nauchno-Issledovatelskii Inst. Vodosnabzheniya, Kanalizatsii, Gidrotekhnicheskikh Sooruzhenii i Inzhenernoi Gidrogeologii, Gosstroi (USSR).
G. S. Altovsky.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 36-38, 1975.

Descriptors: *Sewage sludge, *Sludge treatment, *Dewatering, *Separation techniques, *Incineration, Anaerobic digestion, Sludge digestion, Flocculation, Heat treatment, Sludge disposal, Municipal wastes.

Municipal sludge treatment and disposal methodology is discussed and areas for improvement and research are identified. Common sludge treatment practices include gravity thickening, flotation, centrifugal separation, vibrothickening, stabilization by anaerobic or aerobic digestion, addition of reagents such as ferric chloride and lime, heat treatment, flocculation with high molecular polyelectrolytes, vacuum filtration, pressure filtration, centrifugal dewatering, vibrofiltration, and incineration. Improvements in sludge heat treatment systems required include: heat treatment for sludge conditioning prior to dewatering, heat drying of dewatered sludges for utilization in agriculture, and incineration of unutilized sludge to reduce the mass. Developments and improvements are also required for vibrothickening and dewatering equipment and plants, flocculation agents, and centrifugal separators. Agricultural and sanitary-hygienic evaluations of waste water sludges are also necessary. (See also W79-07825) (Lisk-FRC)
W79-07829

MANAGEMENT AND DISPOSAL OF RESIDUALS FROM TREATMENT OF INDUSTRIAL WASTEWATERS,
Environmental Protection Agency, Washington, DC. Industrial Pollution Control Div.
W. J. Lacy, and A. Cywin.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 39-52, 1975.

Descriptors: *Industrial wastes, *Waste treatment, *Waste disposal, *Waste water treatment, *Waste water disposal, Sludge treatment, Sludge disposal, Hazards.

A summation of eleven reports presented at the National Conference on Management and Disposal of Residues from the Treatment of Industrial Wastewaters is presented. The topics discussed by each speaker at the conference are summarized and the cover pages of the reports are reproduced. The speakers were affiliated with the U.S. Environmental Protection Agency and various industries and utilities. The various problems with and methods of treating and disposing of these wastes as discussed by the participants are summarized. (See also W79-07825) (Lisk-FRC)
W79-07830

INDUSTRIAL SLUDGE DISPOSL PRACTICES,
Environmental Protection Agency, Washington, DC. Industrial Pollution Control Div.
W. J. Lacy, and A. Cywin.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 53-62, 1975.

Descriptors: *Industrial wastes, *Chemical wastes, *Chemical industry, *Oil industry, *Food industry, Textiles, Dairy industry, Pulp and paper industry, Sludge treatment, Water reuse, Recycling, Tannery wastes, Waste water treatment, Waste water disposal.

The characteristics of various industrial wastes and costs and methods of treating and disposing of industrial sludges are summarized. The industrial sludges discussed are generated from the apple, citrus, and potato processing industries; building, construction, and paper industries; sugar beet processing; dairy product processing; flat glass production; grain processing; unbleached kraft and semi-chemical pulp industries; leather tanning and finishing processes; inorganic products industry; red meat processing; smelting and slag processing; steel production; synthetic resins industry; petroleum refining; phosphorus derived chemicals production; textile mills; tire and synthetics industry; and synthetic resins industries. Many of the treatment processes recover residual and reusable materials such as product fines, usable water, and thermal energy. (See also W79-07825) (Lisk-FRC)
W79-07831

THICKENING AND DEWATERING OF WASTE WATER SLUDGES BY VIBRO FILTRATION METHOD,
Vsesoyuznyi Nauchno-Issledovatelskii Inst. Vodosnabzheniya, Kanalizatsii, Gidrotekhnicheskikh Sooruzhenii i Inzhenernoi Gidrogeologii, Gosstroi (USSR).
E. V. Dvinskih.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 63-67, 1975. 4 fig, 1 tab.

Descriptors: *Filtration, *Sludge treatment, *Separation techniques, *Mathematical models, *Screens, Vibrations, Dewatering, Filters, Activated sludge, Industrial wastes, Municipal wastes.

Mathematical models for the vibrofiltration of municipal and industrial sludges were developed to describe the thickening and dewatering processes. The study utilized a model of a continuous gravity vibrofilter with directed vibrations of the filtering media in the frequency range of 20-100 Hz and

cceleration of 10g. Metal screens as the filter nedia were found to be better than synthetic cloth ecause the cloth dissipated the vibrations. The rocess of sludge dewatering by vibrofiltration was ound to occur in two stages. In the first stage, a ayer of sludge with a higher solids content than ncoming sludge formed on the filtering screen and vas covered by a layer of sludge suspension conaining a solids content similar to that of the initial uspension. When this layer decreases to zero, the econd stage begins in initial suspension. When this ayer decreases to zero, the second stage begins in vhich the sludge layer decreases due to the separaion of filtrate. The solids concentration of the ludge layer constantly increases but the solids oncentration gradient on the layer depth is mainained at zero during the second stage of the filtraion process. Mathematical models of both process tages were developed. The vibrofiltration process vas tested for thickened activated sludge, primary ludge, digested coagulated sludge, a mixture of rimary and thickened activated sludge, sludge rom wood-fibered slab plants, and sludge from last furnace gas-cleaning process. V79-07832

MUNICIPAL SLUDGE MANAGEMENT RESEARCH PROGRAM IN THE U.S.A.,
National Environmental Research Center, Cincinati, OH. Advanced Waste Treatment Research ab.
. E. Smith, and W. A. Rosenkranz.
n: Handling, Treatment and Disposal of Vastewater Sludge, p 68-77, 1975. 17 ref.

Descriptors: *Sludge treatment, *Sludge disposal, Heat treatment, *Sludge digestion, *Chemical legradation, Landfills, Application methods, Filration, Dewatering, Incineration, Chemical vastes, Activated sludge, Waste water treatment, Municipal wastes.

Current and developing methods for the treatment nd disposal of municipal sludges are reviewed. Methods of treating and disposing of sludges in urrent practice include ocean dumping, pasteurzation, sterilization, heat treatment, wet oxidation, composting and heat drying, pyrolysis, and coinineration with solid wastes; some of these processs produce usable by-products. Land application echniques include liquid spreading, landfilling, nd trenching. The addition of alum, lime, ferric hloride, or polyelectrolytes during waste water reatment can upgrade treatment efficiencies. Vaste chemical sludge and waste activated sludge nay be treated with lime stabilization, autothermal hermophilic aerobic digestion, ash conditioning, hermal conditioning, top-feed rotary vacuum filration, moving belt filter presses, pressure filtraion, pyrolysis, and wet oxidation. (See also W79-7825) (Lisk-FRC)
V79-07833

NORGANIC SUSPENDED SLUDGE DEWATERING,
eningrad Civil Engineering Inst. (USSR).
. S. Lavrov, N. F. Feodorov, and V. N. Ponomareva.
n: Handling, Treatment and Disposal of Vastewater Sludge, p 78-80, 1975. 4 fig, 1 tab.

Descriptors: *Dewatering, *Sludge, *Flocculation, Coagulation, *Electric currents, Vacuum drying, Electrodes, Separation techniques, Suspension, Industrial wastes, Sludge treatment.

Parameters investigated during dewatering experiments with a flocculant sludge of metal hydroxides rom galvanic work and a concentrated silicateoxide sludge from refractory, ceramic, and abraive industries included: chemical composition of he solids and liquid phases, electrical conductivty, acidity, dispersion degree, stability, zeta-potenial, and the effects of the coagulants and flocculants. The refractory suspension was dosed with 40 nd 75 mg/liter aluminum sulfate or with 0.1-25 ng/liter polyacrylamide. Flocculants were found o be a suitable separation technique followed by compression in the hydroxide systems; a combinaion of coagulants and flocculants were considered more suitable for refractory suspensions. Electric field treatment with voltages in the range of 5-150 v/cm indicated that sludge compression was complete within 5 min of electrical treatment. Electric treatment of refractory sludges when 40-75 mg/liter of aluminum sulfate was injected permitted a reduction in voltage from 125 to 50 v/cm. The effect of electric treatment of sludges on the hydrodynamic specific resistance and efficiency of vacuum filtration of the sludges was also evaluated. (See also W79-07825) (Lisk-FRC)
W79-07834

DEWATERING OF SEWAGE SLUDGE BY MEANS OF CENTRIFUGES,
R. Ya. Agranonick.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 81-84, 1975. 2 tab, 3 ref.

Descriptors: *Centrifugation, *Sewage sludge, *Activated sludge, *Separation techniques, *Dewatering, Chemical degradation, Heat treatment, Sludge digestion, Waste water treatment, Sludge treatment, Municipal wastes.

Centrifuge dewatering was studied with raw or digested primary sludge, a mixture of digested primary and activated sludge, and raw activated sludge containing 28-35% or 38-42% ash. The solid-bowl scroll centrifuge had the advantages of compactness, elimination of the need for chemical additions, and production of transportable sludge with low moisture content. The dewatered sludge cakes had final moisture contents ranging from 65-80%. The centrifuge was also considered useful in low capacity plants with flows to 5,000 cu m. The large quantities of centrate produced by the centrifuge system may be utilized as return sludge, discharged to preliminary settling tanks, treated with combined aerobic and anaerobic digestion when originating from activated sludge mixture centrifugation, or dried in beds when originating from digested sludge. Chemical pretreatment and heat conditioning did improve the efficiency of the centrifuge but were not necessary. (See also W79-07825) (Lisk-FRC)
W79-07835

THERMAL DRYING OF DEWATERED SEWAGE SLUDGE,
L. L. Goldfarb.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 85-87, 1975.

Descriptors: *Sludge treatment, *Dewatering, *Drying, *Heat treatment, *Jets, Nozzles, Moisture content, Gases, Waste water treatment, Sludge disposal, Municipal wastes.

Methods of thermally drying mechanically dewatered sewage sludge were evaluated. Thermal drying of sludges reduces the volume and produces a disinfected, dry, loose, granulated or powdery material suitable as a fertilizer or fuel. Continuous convective dryers utilized in thermal drying of dewatered sludge include rotating, belt, loop, and pipedryers. However, these systems have high fuel consumption and certain operating or efficiency problems. A system of counterjet drying of mechanically dewatered sludge was found to be efficient and economical. In this system, sludge is fed into the dryer and 600-800C fuel gas is injected at 100-400 m/sec from a combuster through nozzles. The sludge is fed to the nozzle shears, comminuted with the hot gas, and passed to two oncoming jets where the streams collide, supplementary sludge disperses, and intensive drying occurs. Insufficiently dried sludge is returned to the dryer and gases are purified prior to discharge. The dried sludge has a moisture content of 30-45%. The dryers are compact, fully automated, simple to operate, and have significantly reduced capital and operating costs. (See also W79-07825) (Lisk-FRC)
W79-07836

AEROBIC STABILIZATION OF ACTIVATED SLUDGE,
Vsesoyuznyi Nauchno-Issledovatelskii Inst. Vodosnabzheniya, Kanalizatsii Gidrotekhnicheskikh Sooruzhenii i Inzhenernoi Gidro-Geologii, Gosstroi (USSR).
A. V. Abramov.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 88-92, 1975. 4 fig.

Descriptors: *Mathematical models, *Stabilization, *Sludge treatment, *Aerobic treatment, *Equations, Analytical techniques, Activated sludge, Mathematical studies, Waste water treatment, Municipal wastes.

Mathematical models were developed to describe primary regularities of excess activated sludge aerobic stabilization. Equations are provided for calculating the degradation limit; the degradation value; the degradation rate; the oxygen uptake rate; the specific oxygen uptake; the required detention time for complete-mixing reactors, for plug-flow reactors, and for multi-cell reactors; gas release values for stabilized and inflowing sludges, and sludge age. Guidelines and recommendations for utilizing the equations are provided and the aerobic stabilization process and the interrelationships of certain factors in the equations are illustrated. W79-07837

UTILIZATION OF MUNICIPAL SLUDGE IN AGRICULTURE,
B. T. Lynam, C. Lue-Hing, R. R. Rimkus, and F. C. Neil.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 110-143, 1975. 10 fig, 17 tab, 37 ref.

Descriptors: *Ultimate disposal, *Agriculture, *Sewage sludge, *Application methods, *Land use, Irrigation systems, Costs, Public health, Monitoring, Crop response.

The utilization of municipal sludge in agriculture is reviewed as a means for the disposal of waste water solids in a technically feasible and socially acceptable manner. The properties of sewage sludge are discussed including plant nutrient levels. Sludge land application rates and their relationship to crop production and reclamation of spoils are discussed. Site selection, design, and management are considered with discussion of topography and soil factors, site preparation, site management, and public relations. Irrigation systems are discussed including soil incorporation and injection systems and Slurry, cake, and solids handling systems. Soil and crop responses to sludge application are explored, and environmental monitoring of the sludge application process is described including public health aspects. Costs of sludge application are presented for Fulton County, Illinois. (See also W79-07825) (Small-FRC)

PROCEEDINGS OF THE SEMINAR ON CURRENT APPROACHES IN WASTEWATER TREATMENT.
For primary bibliographic entry see Field 5D.
W79-07842

OPERATIONAL EXPERIENCE WITH THE ZIMPRO LOW-PRESSURE WET AIR OXIDATION PROCESS,
Gore and Storrie Ltd., Toronto (Ontario).
P. F. da Silva.
In: Proceedings of the Seminar on Current Approaches in Wastewater Treatment, April 5, 1978, Ontario Ministry of Health Laboratories, Toronto, Canada, p 37-45, 1978. 1 fig, 2 tab.

Descriptors: *Sewage sludge, *Dewatering, *Heat treatment, *Vacuum drying, *Oxidation, Filtration, Odor, Incineration, Steam, Sludge treatment, Sludge disposal, Municipal wastes.

Two 200 imperial gpm streams will be added to the Zimpro wet air oxidation units at the Lakeview Water Pollution Control Plant in Canada. The existing units have been operating for three years. Digested, gravity thickened waste activated and raw sludges are blended with propeller-type mixers in the blending tanks, macerated, and pressurized under aeration. The sludge mixture is then preheat-

ed prior to thermal conditioning in the reactor at 375 F. The sludge is thickened to about 10% solids and the supernatant and filtrate are returned to the inlet of the primary tanks. The sludge is then vacuum filtered to a cake with between 38-55% solids. Odor problems at the plant were partially eliminated by scrubbing discharge gases with a solution of potassium permanganate. Fluidized-bed incinerators are under construction to coincinerate odors and filter cake; this system is expected to generate sufficient steam for the thermal conditioning process. THE SAN FRANCISCO BAY DELTA WASTEWATER AND RESIDUAL SOLIDS MANAGEMENT STUDY. VOLUME VI. TECHNICAL APPENDIX. THE PUBLIC HEALTH IMPLICATIONS OF LAND APPLICATION OF WASTEWATER AND RESIDUAL SOLIDS,
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A043 891, Price codes: A04 in paper copy, A01 in microfiche. Report, 1973, 51 p, 5 fig, 6 tab, 2 append.

Descriptors: *Public health, *Wastewater disposal, *Forecasting, *Probability, *Land use, Application methods, Enteric bacteria, Diseases, Zoonoses, Toxicity, Wastewater treatment, Infection.

The public health aspects of wastewater disposal at eight sites is evaluated using the probability matrix technique. The eight sites considered for the disposal of wastewater generated by the 12 Bay Area counties were ranked in three groups. The groupings were based on the potential incidence of Coccidioidomycosis at two sites, and the potential for Zoonotic diseases of encephalitis and plague in all areas. The hazard of toxic and infectious agents can be controlled by wastewater treatment, but the control of Zoonotic disease is less certain. Pilot studies are recommended for representative areas. STRENGTH PROPERTIES OF LIQUID-BORNE FLOCCULATED MATTER,
Delaware Univ., Newark. Dept. of Civil Engineering.
J. E. Quigley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 423, Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis, June 1977. 100 p, 3 fig, 34 ref. OWRT A-036-DEL (1).

Descriptors: *Flocculation, *Aggregates, *Water treatment, Ferric hydroxide.

Breakup of liquid-borne aggregrates during flocculation induced by agitation is important in determining aggregate size distribution and solid/liquid separation process performance. This research attempts to define and measure properties of liquid-borne flocs which characterize resistance to disruption by fluid forces. Disruption of individual flocs (ferric hydroxide, ground activated carbon and calcium carbonate) was filmed in a plane hyperbolic flow field using a modified version of the four roller apparatus devised by G. I. Taylor. Resistance of ferric hydroxide sediment to disruption was affected by centrifugation time. Activated carbon exhibited very slight cohesion, and calcium carbonate was noncohesive. Ferric hydroxide flocs showed no visible resistance to disruption regardless of initial size. When centrifuged for twenty minutes they did not break up or erode. Flocs less than 1 cm broke into two roughly equal fragments; larger flocs broke into multiple smaller fragments. Disruption of only the ferric hydroxide flocs centrifuged ten minutes was effected by changes in roller rotation speed. Strain rates and axial stress are directly proportional and changes in roller speed affected both to the same degree.

REMOVING HYDROGEN SULFIDE WITH HYDROGEN PEROXIDE,
National Water Well Association, Wothington, OH.
T. E. Gass.
Water Well Journal, Vol. 33, No. 6, p 32-33, July, 1979. 1 fig, 1 tab.

Descriptors: *Hydrogen sulfide, *Water treatment, *Hydrogen peroxide, Water analysis, Laboratory tests, Color reactions, Aeration, Chlorination, Activated carbon, Filtration, Oxidation, Ozone, Aesthetics, Taste, Odor.

Drinking water with concentrations of hydrogen sulfide (H2S) as low as .05 to .1 mg/1 has a 'rotten egg' odor and taste and can cause corrosion and tarnishing of iron, copper and silver. Prolonged exposure to H2S leads to paralysis of the olfactory nerves in humans and weight loss, reduced milk production and reproductive complications in livestock. H2S concentrations in water can be measured using the acidizing test or the methylene blue test. The advantages and disadvantage of several methods for removal of H2S from water are tabulated. The use of hydrogen peroxide (H202) to remove H2S is described in detail. H202 breaks down H2S into elemental sulfur and water. If concentrations are high enough, elemental sulfur produced through oxidation may have to be removed with a carbon filter before water is acceptable for drinking or cooking purposes. The design of a hydrogen peroxide feed system is illustrated and explained. Hydrogen peroxide treatment of H2S avoids the high cost, corrosion, residual tastes and slow reaction times of other chemical treatment methods. (Purdin-NWWA)

REDUCTIONS IN WATER CONSUMPTION AND FLOW OF SEWAGE - REPORT TO CONGRESS.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 681, Price codes: A03 in paper copy, A01 in microfiche. 1974. 39 p, 4 fig, 67 ref, 2 append.

Descriptors: *Discharge measurements, *Flow control, *Consumptive use, *Waste water disposal, *Treatment, Investigations, Infiltration, Water conservation, Sewage, Municipal wastes.

The results of the Environmental Protection Agency's investigation of methods of reducing waste water flows and the consumption of water are presented. The report includes an investigation of devices, systems, incentives, policies, and other techniques of reducing the total flow of sewage. This flow reduction analysis incorporated a study of unnecessary water consumption as related to the reduction of requirements for sewage and waste water treatment. The major flow reductions study areas included infiltration/inflow, domestic waste water, industrial waste water, and EPA programs involved with waste water flow reduction. The data identified potentials for reductions in water consumption and waste water flows. Reductions in waste water flows were also related to infiltration/inflow, user charges, waste water discharge standards, cost-effectiveness, facility planning, and effluent guidelines. (Lisk-FRC)

POLICY ON MUNICIPAL SLUDGES,
Environmental Protection Agency, Washington, DC. Municipal Construction Div.
B. L. Seabrook, and W. A. Whittington.
In: Handling, Treatment and Disposal of Wastewater Sludge, p 1-7, 1975. 4 tab.

Descriptors: *Sludge disposal, *Application methods, *Land use, *Incineration, *Landfills, Sewage sludge, Sludge treatment, Return flow, Sludge digestion, Waste water treatment, Municipal wastes.

The implementation of secondary treatment of municipal waste waters will increase the volume of sludge generated, necessitating evaluation of sludge disposal alternatives. Of the approximately 22,000 waste water treatment plants, 5,000 utilize treatment ponds where sludge is seldom extracted. In 1975, sludge was generated at an estimated rate of 17,000 dry tons/day; estimated levels in 1985, after implementation of secondary treatment, are 23,000 dry tons/day. Of the 1975 total, 25% is landfills, 15% is ocean dumped, 35% is incinerated, and 25% is applied to land. Land applications techniques include spreading of liquid digested sludge by tank truck, plow injection, or ridge and furrow spreading. Dried, dewatered sludge or composted, digested sludge may be applied to land or incorporated into the soil by plowing, discing, or other methods. Spray application of digested sludge is another alternative. Considerations in applying sludge to land include concentrations of total and inorganic nitrogen, phosphate, and potassium and requirements of the vegetation. Guidelines have been established for landfilling of sludge. Incineration of sludge is considered a volume reduction process and measures must be taken to limit polychlorinated biphenyl and other emissions from the incinerator. Ocean disposal of sludge is suitable only for those plants presently practicing this method; sludge must meet EPA criteria. (See also W79-07825) (Lisk-FRC)

resents results of an effort to identify and assess nvironmental quality problems associated with ivil Works activities of the Corps of Engineers CE) and a recommended research program to ddress these problems. Visits to all CE Division ffices and subsequent submission of written infor-ation from field offices revealed six key problem reas related to current practices and identified riority research needs. The ability to predict the nvironmental impact of operational alternatives or roposed projects is needed including hydrodyna-ic, chemical, and biological aspects. Operational roblems relative to fluctuating water levels, mini-um releases, and filling alternatives for reservoirs ave been documented, and research on this is equired. Flood control and navigation projects ithin waterways have environmental impacts at, for the most part, have not been documented r specifically related to CE activities in water-ays. Research is required to document those im-acts and provide technology for alleviating ad-erse impacts. Comprehensive techniques for ater resources management harmonious with en-ironmental quality objectives on a regional basis re inadequate or require verification. A research rogram to address the stated problems should nvolve applied research with extensive field stud-es to verify program results. A $30 million, six-ear research program has been proposed to ad-ress these problems. (WES)

escriptors: *Municipal wastes, *Water pollution ources, *Regulation, *Overflow, Discharge(Water), Flow, Streams, State govern-ents, Federal government.

nformation is provided to assist in the develop-ent of state emergency programs for spills of raw r inadequately treated municipal wastewater. Ex-sting and proposed Federal statutes and current tate water pollution laws are reviewed. Over 55 tate and interstate agencies were asked to provide nformation on existing or future water pollution ontingency plans, and over 200 wastewater treat-ent facilities were asked to provide information n emergency plans. Few states were found to equire reporting of spills or had contingency plans pecific for municipal wastewater spills. Very few unicipal treatment systems had formal emergen-y response plans. It is recommended that states evelop regulations and emergency response plans o deal with possible spills. Flow models of critical treams should also be developed. Further, emer-ency equipment and personnel inventories are ecommended. (Small-FRC)

ANALYSES OF 1975-76 MICROZOOPLANKTON SAMPLES FROM TRANSECT II,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
P. L. Johansen.
In: 'Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry,' Texas University Marine Science Institute, Supplemental Reports to Contract AA550-CT6-17, to the Bureau of Land Management, p 2-1 - 2-44, 1979. 1 fig, 4 tab, 9 ref, 2 append. AA550-CT6-17.

Descriptors: *Texas, *Zooplankton, *Biomass, *Water quality, Monitoring, Protozoa, Temporal distribution, Spatial distribution, Water pollution effects, Baseline studies, Resources development, Environmental effects, *Outer Continental Shelf, Petroleum development, Diversity index, Ciliated protozoa, Oligotrichs, Tintinnids, Foraminifera, Radiolaria, Acantharia, South Texas Outer Continental Shelf(STOCS).

Seventy-two (72) one liter samples were collected from the BLM-STOCS Transect II during 1975 and 1976. During November and December 1976, the protozoan biomass ranged from three to seventeen percent of the macrozooplankton biomass. Some qualitative information was obtained from the remaining data. Oligotrichs as a group were widespread in both time and space, while tintinnids, foraminifera, radiolaria/acantharia and other protozoa tended to be more restricted in both temporal and spatial distribution. It is possible that marine protozoa may serve as both short and long term indicators of water quality and should therefore be monitored at regular intervals. (Sinha-OEIS)

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

FUTURE RESEARCH NEEDS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
J. Cairns, Jr.
In: The Freshwater Potomac: Aquatic Communities and Environmental Stresses, p 102-105, 1978. 14 ref. Flynn, K. C., and Mason, W. T., Eds., Interstate Commission on the Potomac River Basin.

Descriptors: *Research and development, *River basin development, *Environmental effects, Modeling, Forecasting, Technology, Methodology, Decision making, Legislation, Manpower, Scientific personnel, Professional personnel, Ecosystems, Protection.

Areas in which research would benefit future studies of the Potomac and other basins are discussed. More programs for professional certification need to be developed to assure professional competency of those engaged in solving environmental problems. The present state-of-the-art for environmental impact statements and other documents proportedly describing the effects of a proposed course of action requires improved methodology in the form of predictive modeling. Existing technology developed for biological monitoring of an ecosystem should be transferred to the industrial and other user groups. Standardizing the methods for the biological assessment of pollution is important, so that the most reliable methods will be used by regulatory agencies and as evidence for major environmental decisions. When environmental legislation was drafted the number of trained personnel and the specialized types of training required were not given the consideration necessary for the successful implementation of these programs. The provision of better man-power estimates with each new price of legislation is suggested. A willingness to recognize collective effort in research would make more data available to users. (Davison-IPA)

A WATER RESOURCE PLANNING PROCEDURE FOR RURAL TOWNS,
Vermont Univ. Burlington, Research Economics.
F. O. Sargent, P. R. Berke, and E. B. Henson.
Water Resources Bulletin, Vol. 15, No. 2, p 496-505, April 1979. 5 tab, 5 ref. OWRT A-019-VT (3).

Descriptors: *Water resources, *Planning, *Lakes, *Watersheds(Basins), *Rural towns, Management, Land use, Water quality, Lake shores, Development potential, Economic value, Carrying capacity, Vulnerability, Intensity index.

Six new techniques have been developed for lake watershed analysis and water resource management. The techniques are for determining: (1) watershed land use intensity with reference to water quality; (2) lake vulnerability; (3) water quality; (4) watershed carrying capacity; (5) the economic value of the lake; and (6) the potential of undeveloped lakeshore. These analyses are designed for use by rural planning commissions with guidance and assistance from state agencies and the state university. The comprehensive rural watershed land and water use plan developed by this procedure is inexpensive in time and money, understandable by the layman, and scientifically sound. It is based on presently available information. This water resource planning procedure has been demonstrated in several town planning projects. It is suggested that this method, or modification of it, could be adopted in all rural states by a few administrators and without any new enabling or appropriations legislation. (Bell Graf-Cornell)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-276 046, Price codes: A05 in paper copy, A01 in microfiche. Report FWS/OBS-77/29, Oct 1977, 63 p.

Descriptors: *Stream flow, *Stream improvement, *Water rights, *Water policy, Flow, Flow system, Stream flow forecasting, Fish conservation, Wildlife, Wildlife conservation, Water supply, Appropriation.

The appropriation doctrine is the principal system by which western states allocate the water use. The most promising strategies (methods) for reserving instream flows for fish and wildlife under existing laws are identified, described and evaluated. Twenty-six strategies are discussed including: (1) obtaining an appropriation from state water rights agency; (2) condemning and reallocating existing rights; (3) encouraging the state water permit authority to take advantage of discretionary opportunities; (4) obtaining a moratorium on new appropriations and further stream depletions; (5) enhancing stream flows through contractual arrangements, (6) adopting interagency agreements, regulations, and formal procedures; (7) identifying instream flow requirements of endangered species; (8) including streams within a Wild and Scenic Rivers system; (9) legislatively designating important fishery streams; (10) utilizing water-quality laws; (11) obtaining reservoir space, (12) including stipulations in new and renewed licenses and permits; (13) reauthorizing existing projects; (14) utilizing public trust doctrine; (15) participating in statewide water planning; (16) utilizing federal funding programs; (17) conveying stored water to downstream/users; (18) constructing larger new reservoirs; (19) coordinating operation of multi-reservoir systems and (20) releasing from reservoir sediment storage reserves. CHATTAHOOCHEE RIVER THERMAL ALTERATIONS,
Geological Survey, NSTL Station, MS. Water Resources Div. and Geological Survey, Doraville, GA. Water Resources Div.
H. E. Jobson, L. F. Land, and R. E. Faye.
ASCE Proceedings, Journal of the Hydraulics Division, Vol. 105, No. HY4, Paper 14499, p 295-311, April 1979. 10 fig, 8 ref.

Descriptors: *Thermal pollution, *Streamflow, *Model studies, *Forecasting, *Water temperature, Powerplants, Cooling water, Mathematical models, Computer models, Heat transfer, Heat balance, Analytical techniques, Georgia, *Chattahoochee River(Ga).

A coupled flow-temperature model, developed previously for use with highly unsteady flow, was applied to a 43.12-mile reach of the Chattachoochee River starting in the urbanized section of Atlanta, Ga. The thermal regime of the modeled reach is modified by upstream reservoirs and includes the cooling-water discharge from the Atkinson and McDonough Power Plants which increases the river temperature by as much as 8.4 C. A linear, implicit finite-difference flow model was calibrated by use of a depth profile obtained at steady low flow as well as unsteady flow data obtained in July 1976. The flow model was verified by use of dynamic stage and discharge data obtained in August 1976. The water temperature changed as much as 4.4 C while passing through a 17-mile part of the reach and the temperature model was capable of predicting these changes with a root-mean-square error of 0.72 C in July and 0.65 C in August 1976. (Woodard-USGS)

TECHNIQUE FOR ESTIMATING MAGNITUDE AND FREQUENCY OF FLOODS IN DELAWARE,
Geological Survey, Towson, MD. Water Resources Div.
R. H. Simmons, and D. H. Carpenter.
Geological Survey Water-Resources Investigations 78-93 (open-file report), September 1978. 69 p, 3 fig, 3 plates, 5 tab, 15 ref.

Descriptors: *Delaware, *Flood forecasting, Flood recurrence interval, *Flood peak, *Regression analysis, Streamflow, Peak discharge, Natural streams, Watersheds(Basins), Analytical techniques, Flood frequency, Gaging stations, Model studies, Rainfall-runoff relationships, Equations, Evaluation, Ungaged streams, Basin characteristics.

A flood-estimating method is presented which applies to drainage basins in Delaware without urban development and covers selected recurrence intervals from 2 to 100 years. The method was developed by multiple-regression techniques. The State is divided into two regions and sets of equations for calculating peak discharges based on physical basin characteristics are provided for each region. The boundary between regions generally corresponds with the division between the Piedmont and Coastal Plain provinces. In the northern region, flood-peak discharges were related to basin drainage area and storage. In the southern region, flood peaks were related to drainage area, slope, storage, forest cover, and two composite soil categories. Standard errors of estimate for the regression equations in the northern region ranged from 30 to 39 percent. For the southern region, the standard errors of estimate varied from 38 to 40 percent. Without using the two soil parameters in the southern region, the standard errors of estimate varied from 57 to 70 percent. Annual flood peaks, basin characteristics, and flood-frequency distributions are tabulated for the 60-gaged sites used in the regression analysis. At 23 of these sites, a rainfall-runoff model generated additional flood-peak data which were used in defining the flood-frequency distributions. (Woodard-USGS)

THE USE OF A SIMPLE MODEL AND UNCERTAINTY ANALYSIS IN LAKE MANAGEMENT,
Michigan State Univ., East Lansing. Dept. of Resources Development.
K. Reckhow.
Water Resources Bulletin, Vol. 15, No. 3, p 601-611, June 1979. 3 fig, 3 tab, 8 ref.

Descriptors: *Uncertainty, *Lakes, *Management, *Water quality, *Mathematical models, Phosphorus, Nonlinear regression analysis, Estimating, Confidence limits, Prediction, Nutrient budget, Sampling design, Data analysis, New Hampshire, Equations, Systems analysis.

A simple, black-box lake model was developed for phosphorus, using nonlinear regression analysis on a data base of north temperate lakes. The uncertainty associated with the model was then combined with the parameter uncertainty and the independent variable uncertainty to provide an estimate of the confidence limits associated with a predicted value. The prediction uncertainty is often neglected, yet it is an important measure of the usefulness of a model. Prediction uncertainty reflects the modeler's confidence in the model, and it should be used by a decision maker as a weight indicating the value of the model prediction. A procedure is outlined that combines lake modeling and uncertainty analysis for use in lake quality assessment and lake management. An example is provided illustrating the use of this procedure in nutrient budget sampling design, data analysis, and the evaluation of lake management strategies for a 208 program in New Hampshire. (Bell-Graf--Cornell)
W79-07996

ANALYSIS OF CLOSED CONDUIT IRRIGATION SYSTEM AND ITS SUBDIVISION,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
D. Karmeli, and G. Oron.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol. 105, No. IR2, p 187-196, June 1979. 2 fig, 1 tab, 15 ref.

Descriptors: *Irrigation systems, *Closed conduits, *Mixed integer programming, *Nonlinear programming, *Cost minimization, Optimization, Subdivisions, Constraints, Mathematical models, Equations, Systems analysis, Pipes, Objective function, Methodology, Water distribution(Applied).

An analysis of closed conduit irrigation systems towards minimal system cost is presented, using a nonlinear mixed integer programming optimization procedure. Emphasis is on the subdivision of the system into subunits and the relationship between the subunits, design parameters and system cost. The variables defined in the objective function and constraints are the number of manifold and lateral outlets, sizes of mains, submains, supplies, manifolds and laterals. An application example is given in which the subdivision for an irrigation system of a specific field is analyzed. (Bell Graf-Cornell)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 273, Price codes: A06 in paper copy, A01 in microfiche. Utah Water Resources Planning Series, UWRL/P-79/05, May 1979. 110 p, 7 fig, 10 tab, 2 append. OWRT C-7161 (No. 6212) (1), 14-34-0001-6212.

escriptors: *River basin, *Planning, Decision aking, Political aspects, Social values, Colorado ver Basin, Uintah Basin.

nce every water resources management choice s two or more sides, differences must be re-lved. Equitable resolution requires understanding e reasons for the differences. The differences are tween decisions made by individuals and groups pacted in physical-environmental, economic, cial, cultural, and political dimensions and at vels ranging from local to international. The cisions generate additional impacts; and the in-ractive process changes water management prac-e in ways outside the control of any one decision int. The objective of this study is to conceptual-e this process in a way that will help establish stitutional mechanisms for reconciling differ-ces among levels of analysis. The conceptualiza-n views differences in the choices being made at rious levels of analysis as associated with per-ective differences having value, jurisdiction, tion and temporal elements. The history of water sources planning in the Colorado River Basin d a computerized simulation of water planning r the Uintah Basin are used to identify and ovide background for analyzing 20 major obsta-es to effective water resources planning. The rinciples of logic as applicable to rationality in cision making are used to identify two root uses of levels' conflicts. These are that the conse-ences of individual actions do not sum to the nsequences of an entire program and that indi-dual values do not aggregate linearly in forming cial values. Consequently many actions are not ficient in achieving preferred values, and deci-n makers are not able to implement desired ans. Nine recommendations are made on how to prove water resources planning in an interac-ve, nonlinear world.

ATER IN THE WEST,
eological Survey, Reston, VA. Water Resources iv.
. E. Ferguson.
eotimes, p 27-29, March 1979.

escriptors: *History, *Water resources develop-ent, *Data collections, Federal government, ooperatives, Cost sharing, Reviews, *US Geo-gical Survey, *Water resources division.

lthough water-resources investigation has been ne of the major activities of the U.S. Geological urvey for many decades, water as a resource eceived no direct attention in 4 early surveys of he West, and the term 'water' cannot even be ound in the act of Congress of March 3, 1879, hich established the Survey. Several major rivers f the West had been surveyed but only because ey were barriers in East-West transportation cor-dors. However, in 1888--9 years after its estab-shment--the Survey brought together 14 carefully chosen men led by Frederick H. Newell, at a camp near Embudo, N. Mex., to select and provide train-ing in methods, instruments, and equipment needed for systematic stream gaging. A Senate resolution of that year, directing the Survey to investigate the practicality of storing water in the arid regions, required a knowledge of streamflow. Although others had collected various types of records of stream discharge at various places in the United States and in foreign countries, the Survey devel-oped techniques and standards that were widely accepted, and its stream-gaging network grew steadily, both in size and in geographic coverage. Today the Survey's Chief Hydrologist, Joseph S. Cragwall, Jr., directs an organization of about 4,100 full- and part-time employees, located in 46 district offices administered by 4 regional head-quarters. Congressional appropriations fund slight-ly more than half the water-resources programs, about 580 State and municipal agencies fund more than a quarter, and 27 other Federal agencies pro-vide money for the rest. ENERGY DEVELOPMENT SCENARIOS AND WATER DEMANDS AND SUPPLIES--AN OVERVIEW,
Geological Survey, Reston, VA. Water Resources Div.
F. A. Kilpatrick.
Geological Survey open-file report 77-697, August 1977. 14 p, 10 fig, 3 tab, 16 ref.

Descriptors: *Water demand, *Available water, *Mining, *Energy, *Central U.S., Coal mines, Oil shales, Transportation, Slurries, Pipelines, Evalua-tion, Missouri River, Colorado River basin, *Energy development.

On the basis of average mean annual flows, ample water exists in the upper Missouri River basin for energy development. The lack of storage and di-version works upstream as well as State compacts preclude the ready use of this surplus water. These surplus flows are impounded in mainstream reser-voirs on the Missouri downstream from coal mining areas but could be transported back at some expense for use in Wyoming and North Dakota. There are limited water supplies available for the development of coal and oil shale industries in the upper Colorado River Basin. Fortunately oil shale mining, retorting and reclamation do not require as much water as coal conversion; in-situ oil shale retorting would seem to be particularly desirable in the light of reduced water consumption. Existing patterns of energy production, transport, and con-version suggest that more of the coal to be mined out West is apt to be transmitted to existing load centers rather than converted to electricity or gas in the water-short West. Scenarios of development of the West's fossil fuels may be overestimating the need for water since they have assumed that major conversion industries would develop in the West. Transport of coal to existing users will require all means of coal movement including unit trains, barges, and coal slurry pipelines. The latter is considered more desirable than the development of conversion industries in the West when overall water consumption is considered. (Woodard-USGS)

PLANS FOR WATER DATA ACQUISITION BY FEDERAL AGENCIES THROUGH FISCAL YEAR 1980,
Geological Survey, Reston, VA. Water Resources Div.
Geological Survey Office of Water Data Coordi-nation report, January 1979. 78 p, 2 append.

Descriptors: *Data collections, *Programs, *Fed-eral government, *Water resources development, Water supply, Water quality, Water utilization, Water pollution control, Land use, Urbanization, Flood control, Available water, Surface waters, Groundwater, Department of Agriculture, Depart-ment of Commerce, Department of Defense, De-partment of Energy, Department of Housing and Urban Development, Department of Interior, De-partment of Transportation, Council on Environ-mental Quality, Environmental Protection Agency, International Boundary and Water Com-mission, International Joint Commission, Nuclear Regulatory Commission, Tennessee Valley Au-thority, Water Resources Council.

This report was prepared by the Office of Water Data Coordination (OWDC), U.S. Geological Survey, in partial response to requirements of Bureau of the Budget (now Office of Management and Budget (OMB)) Circular A-67 (appendix A), which sets forth guidelines for the coordination of certain water-data acquisition activities by Federal agencies. The report was prepared in lieu of the customary annual 'Federal Plan for the Acquisition of Water Data.' Included are statements on Feder-al agencies' current water-data programs, plans and needs for water data through fiscal year (FY) 1980, and longer range water-data needs. The agency program summaries generally indicate that for FY 1980 most Federal programs for water-data collection will remain at approximately the same level of funding as for FY 1978 and 1979. Fore-most among agencies' current needs are additional data on water quality, water use, and surface-water resources. (Woodard-USGS)

DEVELOPER'S HANDBOOK,
Connecticut Dept. of Environmental Protection, Hartford. Coastal Area Management Program.
A. Carroll.
1972. 60 p.

Descriptors: *Permits, *Regulation, *Wetlands, *Quality control, Dredging, Burning, Air pollu-tion, Water pollution, Planning, Septic tanks, Water supply, Road design, Construction, Lands-caping, Aesthetics.

The handbook is designed to help make the legal requirements for permits for environmental change more manageable to developers and to provide some basic information and advice on subdivision planning. The major natural systems and resources are briefly explained, and the opportunities and limitations they impose on development are sum-marized. A system of evaluating the characteristics of potential development sites is outlined and regu-latory programs at the Connecticut Department of Environmental Protection with which developers may have to concern themselves are covered. (Bol-linger-Mass)
W79-07735

ANALYSIS OF ECONOMIC EFFECTS OF WATER SURFACE ELEVATIONS ON U.S. SHORELINE OF LAKE CHAMPLAIN, NEW YORK AND VERMONT,
URS/Madigan-Praeger, Inc., New York.
Prepared for the International Joint Commission, International Champlain-Richelieu Board, August 31, 1977. 215 p.

Descriptors: *Lake Champlain, *Water level fluc-tuations, *Reservoir management, *Estimated benefits, Wetlands, Marsh plants, Water levels, Marsh management, Economic impact, Evalua-tion, Economic prediction, Flood damage, Dam-ages.

The objective was to develop the net benefits of the proposed regulation of the lake level by the use

of three proposed structural alternatives. The net benefits are obtained by subtracting the estimated damages with structual regulation from the estimated damages with regulation; the difference is considered to be the benefits of the scheme under consideration. Physical damages realized due to the high water condition would include costs for those structures with which the flood waters came into direct contact, i.e., homes, roads, furnishings. Non-physical damages would include costs for inconvenience due to flood occurrence, i.e., time lost, clean-up costs, wages lost from work. Adverse effects associated with extreme low-water conditions include exposed water supply intakes, loss of boat dock use, and exposure of unsightly lake bottom. The present wetland ecosystem, however, is dependent upon fluctuating water levels with periodic highs and lows. High waters flood out some of the emergents which sometimes form too dense or solid stands. It is particularly useful in the natural control of cattails and buttonbush. (Steiner-Mass)

FIRST ORDER ESTIMATES OF ENERGY REQUIREMENTS FOR POLLUTION CONTROL,
Development Sciences, Inc., Sagamore, MA.
J. L. Barker, K. Maddox, J. D. Westfield, and D. Wilcock.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 274, Price codes: A05 in paper copy, A01 in microfiche. Report EPA-600/7-78-022, 1978. 88 p, 4 fig, 31 tab, 66 ref, 2 append.

Descriptors: *Cost analysis, *Pollution abatement, *Water pollution control, *Air pollution, *Thermal pollution, Industrial wastes, Energy, Municipal wastes, Powerplants, Fuels, Operating costs, Operation and maintenance, Waste water treatment.

A cost analysis of the pollution controls required for stationary point sources included a cost estimation of controls for water pollution from powerplants, factories, refineries, municipal waste water treatment plants, and certain air pollution sources. Results of the study indicated that in 1977, a total of 1,553 trillion Btu of energy was required to control both water and air pollution from industrial and municipal sources. In 1983, a total of 3,075 trillion Btu is estimated for pollution abatement. The sources of these energy requirements include: energy for operation of control devices such as fans, pumps, and reheaters; the additional fuel requirement for processes where pollution abatement techniques degrade the efficiency of the process; the energy required for the production, transport, and installation of the pollution control equipment; and the energy expended in producing and transporting pollution control material such as limestone and chlorine. About 80% of the total energy requirements may be attributed to the direct utilization of fuel or electricity to operate pollution control equipment. The largest energy demands are required for control of industrial air pollution sources, followed by the energy requirements for controlling industrial water pollution. The third highest demand is the abatement of air pollution from powerplants. The report does not incorporate pollution controls for mobile pollution sources and non-point sources. (Lisk-FRC)

GUIDANCE ECONOMIC ANALYSIS FOR THE CONCRETE PRODUCTS INDUSTRIES.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-273 471, Price codes: A05 in paper copy, A01 in microfiche. Report EPA 440/2-77-016, 1977. 90 p, 54 tab.

Descriptors: *Economic impact, *Federal Water Pollution Control Act, *Industrial water, *Waste water treatment, *Concrete technology, Capital costs, Operating costs, Prices, Employment.

The economic impact of the application of alternative effluent limitation guidelines and standards of performance to be established by sections 304(b) and 306 of the Federal Water Pollution Control Act, as amended, was analyzed for the concrete products industry. Existing and potential wastewater treatment control methods are surveyed. Investment and operating costs associated with various alternative control and treatment technologies are presented. Also, the broader economic effects of alternative approaches are examined. The effects on product price, unemployment and the continued viability of affected plants, and competitive effects such as the effect on foreign trade, are investigated. (Small-FRC)

OPTIMUM ALTERNATIVES FOR CONTROLLING COMBINED SEWAGE OVERFLOWS--A CASE STUDY,
Barr Engineering Co., Minneapolis, MN.
I. Yomtovian.
Water Resources Bulletin, Vol. 15, No. 3, p 628-643, June 1979. 5 fig, 2 tab, 6 ref.

Descriptors: *Sewage systems, *Sewage overflow, *Methodology, *Effects, *Water quality, *Economic efficiency, *Combined sewers, Mississippi River, Optimization, Storm sewers, Water pollution control, Waste water disposal, Treatment facilities, Hydrology, Bypasses, Cost effectiveness.

Frequent high quantity overflows of combined sewage entering the Mississippi River near the city of Red Wing, Minnesota, have degraded water quality and caused concern among federal and state environmental agencies. The city of Red Wing was required to conduct a comprehensive waste control study, as part of the sewer system Construction Grant (Section 201 of PL 92-500), to identify alternative waste control and treatment measures and to recommend the optimum combination of alternatives in terms of both cost and waste control effectiveness. The study involved these basic steps: determination of present and future (year 2020) sanitary flow rates and volumes, storm runoff discharges, frequencies and volumes, and combined sewage bypass volumes; identification of alternative waste control measures; elimination of unfeasible alternatives; detailed analysis of the hydrologic, economic, and waste control feasibility of the promising alternatives; selection of the optimum combination of alternative waste control measures to satisfy the study objectives, and determination of construction priorities of the optimum control measures. Because of an uncertain budget and undetermined conditions of state and federal assistance, the city has not yet selected the optimum waste control measure for its needs. When the decision-making process between representatives of the city and the state commences, the optimum combination of waste control alternatives can be easily identified using results of this study. COST ANALYSIS OF WATER AND WASTE WATER TREATMENT PROCESSES IN DEVELOPING COUNTRIES,
Universidade Federal da Paraiba (Brazil).
M. I. Muiga, and G. W. Reid.
Water Resources Bulletin, Vol. 15, No. 3, p 838-852, June 1979. 1 fig, 5 tab, 17 ref.

Descriptors: *Water treatment, *Waste water treatment, *Cost analysis, *Predictive equations, *Regional models, *Planning, *Developing countries, Socio-economic indicators, Environment, Technology, Africa, Asia, Latin America, Construction costs, Operation and maintenance, Sand filters, Stabilization lagoon, Aerated lagoons, Activated sludge, Trickling filters, Water quality, Design capacity, Population, Systems analysis.

Mathematical modeling techniques have been used to develop predictive equations for the cost of water and waste water treatment processes in developing countries utilizing socio-economic, environmental, and technological indicators. Predictive equations were developed for each of the three regions (Africa, Asia, and Latin America) for construction, operation and maintenance costs of slow sand filter, rapid sand filter, stablization lagoon, aerated lagoon, activated sludge, and trickling filter. Data analysis indicated that cost of water treatment processes is a function of technological indicator (percentage of imported materials), population, and the design capacity. The variables which gave the best correlation for waste water treatment cost were population, design flow, and the percentage of imported waste water disposal materials. (Bell-Graf--Cornell)

WATER REUSE AND RECYCLING, VOLUME I: EVALUATION OF NEEDS AND POTENTIAL,
Culp/Wesner/Culp, Santa Ana, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 283, Price codes: A09 in paper copy, A01 in microfiche. Office of Water Research and Technology Report No. OWRT/RU-79-1, April 1979. 194 p, 22 fig, 37 tab, 67 ref. OWRT R-0088 (No. 7804) (1).

Descriptors: *Water reuse, *Recycling, *Hydrologic data, *Water quality, *Water quality control, *Water requirements, *Planning, Industrial water,

Agriculture, Regions, Irrigation, Cooling, Water supply, Water supply development.

Estimates of the potential for waste water reuse and recycling in the United States in 1985 and 2000 are presented. Information developed by the U.S. Water Resources Council (WRC) for the Second National Water Assessment was used to supply the basic data for water supply, water needs and availability, and waste water discharges. Recycling estimates derived from studies by the WRC, the Department of Commerce, the Bureau of Mines, and the Federal Power Commission (now the Federal Energy Regulatory Commission in the Department of Energy), are presented for industries and steam electric plants. Existing and proposed waste water reuse facilities are reported for each WRC Region. Water quality requirements are described for the following potential reusers of reclaimed waste water: agricultural irrigation, landscape irrigation, steam electric cooling, industrial cooling, and other industrial uses. Altough the Nation's water supplies are generally sufficient to meet the requirements for all beneficial purposes, there are major water supply problems in most of the 21 regions and severe local problems in many of the 106 subregions. Waste water discharges available for reuse and withdrawals capable of waste water reuse are tabulated for each of the 21 WRC Regions for 1975, 1985 and 2000. Regional evaluations for Lower Colorado and California are included. (Davison-IPA)

REPORT OF THE RIVER MASTER OF THE DELAWARE RIVER FOR THE PERIOD DECEMBER 1, 1976 -- NOVEMBER 30, 1977,
Geological Survey, Reston, VA. Water Resources Div. and Geological Survey, Milford, PA. Water Resources Div.
F. T. Schaefer, and R. E. Fish.
Geological Survey Delaware River Master report, 1978. 105 p, 6 fig, 2 plates, 20 tab, append.

Descriptors: *Delaware River, *Watershed management, *Available water, *Water delivery, *Water quality, Reservoir storage, Reservoir releases, Estuaries, Saline water intrusion, Monitoring, *Delaware River Master, Annual report.

This annual report of the River Master of the Delaware River is for the year December 1, 1976, to November 30, 1977. In terms of water supply, the year was above normal. The discharge of the Delaware River at Montague, New Jersey, adjusted for diversions and changes in reservoir storage, was 28 percent above median and the ninth highest since 1940. Total combined storage in Pepacton, Cannonsville, and Neversink Reservoirs was 87.9 percent of capacity on December 1, 1976, as compared with 95.9 percent a year earlier. This was the third highest total storage at the beginning of any report year since the construction of the reservoirs. Diversions for water supply for New York City and releases to maintain the flow of the Delaware River at Montague were made under the supervision of the River Master, as provided in the terms of the Amended Decree of the Supreme Court, June 7, 1954. Diversions through the Delaware & Raritan Canal in New Jersey did not exceed the limits imposed in the Decree. Data from the water-quality monitoring program carried out by the U.S. Geological Survey in the Delaware River Estuary are included. (Woodard-USGS)

HYDROLOGY,
Geological Survey, Reston, VA. Water Resources Div.
J. E. Moore.
In: Encyclopedia Britannica Yearbook of Science and Future, Earth Sciences, p 316-317, 1979.

Descriptors: *Hydrology, *Conferences, *Water quality, *Water supply, Surface waters, Groundwater, Water pollution, Waste disposal, Floods, Flood damage, Flood plains, Water policy, Water conservation, Sewage treatment, Symposia topics.

This paper briefly discusses several major technical symposia concentrated on topics of concern during 1978. The National Water Well Association and the U.S. Environmental Protection Agency sponsored the National Ground Water Quality Symposium in Minneapolis, Minn., to discuss groundwater pollution and ground-water protection policies. A two-day symposium at the annual meeting of the American Chemical Society in Miami Beach, Fla., highlighted past and present research in water chemistry and effects of radioactive waste disposal on water resources. At the American Water Resources Association meeting in Florida three symposia dealt with the interrelationship of energy, environment, and economics. (Woodard-USGS)

6E. Water Law and Institutions

OVERCOMING LEGAL AND INSTITUTIONAL BARRIERS TO PLANNED REUSE OF WATER IN THE COLORADO RIVER BASIN,
Denver Research Inst., CO. Industrial Economics Div.
J. G. Milliken, L. C. Lohman, A. S. Trumbly, and L. Roll.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 270, Price codes: A10 in paper copy, A01 in microfiche. Office of Water Research and Technology Report No. OWRT/RU-79/3, April 1979. 211 p, 17 fig, 7 tab, 333 ref. OWRT R-0050 (No. 7816) (1).

Descriptors: *Water reuse, *Institutional constraints, *Policy constraints, *Legal aspects, *Social aspects, *Economic impact, *Planning, Impaired water use, Water allocation(Policy), Water policy, Water resources development, Water utilization, Colorado River Basin.

Research was undertaken to identify and analyze the severity of the legal, institutional, political, and economic obstacles to planned water reuse in the Colorado River Basin, to analyze and assess methods or strategies that aid in overcoming these obstacles, and to develop conclusions on them for the promotion of greater planned reuse within the Basin. Nonagricultural reuse and consumptive reuse of low quality water are emphasized. Barriers to reuse found in interstate and state-specific water allocation law, and in Federal and State environmental laws were identified through legal research; comprehensive interviews with water management officials in the Basin and a document review identified the institutional and political obstacles; available literature was used to document societal positions on different types of water reuse; and the concerns of water reusers were obtained from interviews and documentation. Five case studies of various attempts to reuse water in the Basin were conducted to establish the interaction between reuse barriers and incentives. The strategies found most likely to promote reuse include creative tactics by prospective reusers, strategic actions by State water allocators, and changes in statutes; institutional conflicts were reduced by making benefits visable to parties in conflict. (Davison-IPA)

FRESHWATER USE CUSTOMS ON GUAM-AN EXPLORATORY STUDY,
Guam Univ., Agana. Water Resources Research Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 299, Price codes: A08 in paper copy, A01 in microfiche. Publication No. 8, 1979. 146 p, 37 fig, 78 ref, 3 append. Stephenson, R.A., Editor. OWRT A-009-GUAM (1), 14-34-0001-8012, 9012.

Descriptors: *Social aspects, Attitudes, History, *Guam, Mariana Islands, Chamorro.

Traditional Chamorro freshwater use customs on Guam still exist, at least in the recollections of Chamorros above the age of 40, if not in actual practice in the present day. Such customs were analyzed in both their past and present context, and are documented. Archaeological evidence suggests a close correspondence between prehistoric settlement patterns and freshwater sources. It is speculated that pre- and post-contact Chamorro living in the northern plateau of Guam may have been involved in reciprocal trading arrangements with sites that had fresh water readily available during dry periods. The perception of freshwater in the Chamorro language context is shown to be

changing. Ethnohistorical studies indicate that availability of freshwater to meet the needs of Guam's people has always been a problem. Sociocultural studies, as gleaned from a questionnaire, on the other hand, suggest that Chamorros over the age of 40 do not recall problems for the most part in their villages of residence and traditional water sources by locally derived names, names that are not often found on present day maps of Guam. Further studies of freshwater use customs on Guam are recommended.
W79-07569

COLORADO GROUND WATER UP FOR GRABS.
Water Well Journal, Vol. 33, No. 6, p 62-74, June, 1979.

Descriptors: *Water rights, *Colorado, *Ground water resources, *Appropriation, Law, Prior appropriation, Legal aspects, Economic feasibility.

The Colorado Constitution established the doctrine of prior appropriation meaning that the first person to claim water and put it to beneficial use has rights to that water perpetually. The 1969 Colorado Water Rights Act states that all water originating in the state, whether surface or underground, is subject to appropriation. However, a new law called SB213 makes land ownership a prerequisite for tapping, non-tributary or bedrock ground waters. Three groups are filing claims to Colorado's unappropriated ground water. They intend to use the water for: large-scale real estate development; trans-mountain diversion of water from western to eastern Colorado; and saltwater fish farms. Even if the claims are granted, it may not be economically feasible to recover the water due to high drilling, pumping, and reclamation costs and water quality problems. (Purdin-NWWA)

IMPACT OF THE LAW REGULATING DRINKING WATER ON WATER RESOURCES MANAGEMENT,
Connecticut University, Storrs, Department of Business Environment and Policy.
M. M. Huffmire.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 762, Price codes: A02 in paper copy, A01 in microfiche. Connecticut University, Storrs, Institute of Water Resources. Research Project Technical Completion Report, 1979. 10 p, 3 ref. OWRT A-079-CONN(1), 14-34-0001-9007.

Descriptors: *Ground water, *Aquifers, *Land use, *Water law, Economics, Connecticut, *Water resources management, *Drinking water supplies, *Safe drinking water act, *Water quality protection, *Investor-owned water companies, *Surplus land holdings, Moratorium on land sales, Surface water impoundments, Legal implications.

Costs of compliance with minimum standards for water quality in Connecticut mandated by the Safe Drinking Water Act have led some investor-owned water utility companies to attempt to dispose of what they argue are surplus land holdings. There is presently a moratorium on the sale of these lands but the question arises as to what will eventually be done with property. The state is considering whether it should grant special assistance to the investor-owned water utility companies in meeting the costs of complying with the Safe Drinking Water Act requirements and what form that aid should take. However, if present and anticipated increases in costs caused by the Safe Drinking Water Act are not eventually passed on to the consumers in the rate base and new methods of funding will be used to insure continued low cost of the resource, demand will be further divorced from supply and market mechanisms will be rendered ineffective. Adequate protection of aquifers and surface water impoundments requires not only continued water company ownership of the land covered by the moratorium, but also that relevant lands within the state are regulated as part of a comprehensive program for protecting present and future drinking water supplies. Where ground water and surface water rights are in conflict, a comprehensive management system should be adopted to establish an order of preferred uses and optimize water availability by providing for conjunctive use of ground water and surface water.

NEW ONTARIO POLICY FOR LOW COST ALTERNATIVES TO COMMUNAL WATER AND SEWAGE TREATMENT,
Ontario Ministry of the Environment (Toronto).
G. Mierzynski.
In: Proceedings of the Seminar on Current Approaches in Wastewater Treatment, April 5, 1978, Ontario Ministry of Health Laboratories, Toronto, Canada, p 1-5 (1978).

Descriptors: *Administration, *Canada, *Septic tanks, *Water wells, *Rural areas, Community development, Cost analysis, Grants, Treatment facilities, Water supply, Waste water treatment, Waste water disposal, Municipal wastes, Domestic wastes.

The Ontario Ministry of the Environment has adopted a policy of providing grants to municipalities for repairing or renewing private systems in defined problem areas where command systems are not cost effective. The average cost per home for communal water and waste treatment facilities, based on 1977 statistics, was $5,500 for water systems and $6,600 for sewage systems. For individual private systems, the costs are about $1,500 for a well and $2,500 for a septic tank and tile field. The new policy extends only to the renewal or repair of existing systems; however, the policy may be extended to new systems in an existing structure located a significant distance from the solution to the water or waste treatment problem and not located in an area of potential growth. The policy will also apply to unorganized communities and small communities with little growth potential which qualified under previous policies. New and novel systems of treatment should be considered along with conventional systems, and combinations of private and communal systems may be possible. (See also W79-07842) (Lisk-FRC)

FEDERAL RESERVED WATER RIGHTS SINCE PLLRC,
Wyoming Univ., Laramie.
F. J. Trelease.
Public Land and Resources Law Journal, Vol. 15, No. 2, p 218-36, 1978.

Descriptors: *Reservation doctrine, *Legislation, *Federal reservations, Federal government, Federal-state water rights conflicts, Federal jurisdiction, Prior appropriation, Water policy, Water control, Water law.

When the federal government withdraws a part of its land from the public domain and reserves it for a federal purpose, the government by implication reserves enough of the 'appurtenant' unappropriated water to accomplish the purpose of the reservation. This water right may lie dormant for years. If the government eventually exercizes its reserved right, its priority relates not to the date of use but to the earlier date when the reservation was created. Since the investment and enterprise of the private water user are lost when the government takes the water, the federal reserved water rights are viewed by many as a serious threat to every title to water rights of every stream which touches a federal reservation. The history of the reserved water doctrine, the effects of Supreme Court decisions on the doctrine and the effect the Public Land Law Review Commission on the doctrine are examined. The threat the reserve doctrine poses to private users may be illusory since not a single case of the federal government destroying a private right has been reported. (Vloedman-Florida)

LAND APPLICATION OF WASTEWATER AND STATE WATER LAW: STATE ANALYSES VOLUME II,
Wisconsin Univ.-Madison. School of Law.
D. W. Large.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-286 975, Price codes: A09 in paper copy, A01 in microfiche. Report EPA-600/2-78-175, August, 1978, 197 p.

Descriptors: *Waste water disposal, *State governments, *Water rights, Legal aspects, Water policy, Judicial decisions, Riparian rights, Appropriation, Surface-groundwater relationships, Regulations.

This report's purpose was to: (1) define the legal questions which pertain to land application of wastewater in the context of private water rights law; (2) explain the riparian and appropriation theories; (3) identify the particular aspects of each theory that influence treatment system design and operation; and (4) analyze the private water rights laws of selected states in relationship to land application systems. Hostility to land application systems was not discovered in any of the states' laws analyzed. Occasional uncertainties existed in several states caused by the lack of statutes, regulations, or judicial decisions involving land application. The position of land application systems was strongest in the eastern riparian states. Probably the most favorable eastern states for the land application systems are Florida, Pennsylvania, and Ohio. Each of these states displays a receptiveness toward innovative water uses. The western appropriation states were generally less favorable to land application. This was primarily because the appropriation theory recognizes enforceable rights in all water types, whereas under the riparian theory, such rights are usually limited to watercourses. (Ewing-Florida)

FLOOD PLAIN DEVELOPMENT PRESSURES AND FEDERAL PROGRAMS-PART 1-CASE STUDY ANALYSIS AND RECOMMENDATIONS FOR THE '201' WASTEWATER TREATMENT WORKS PROGRAM,
Research Group, Inc., Atlanta, GA.
L. F. Dean.
EPA 130/1-79-001, May, 1979, 77 p.

Descriptors: *Floodplains, *Waste treatment, *Sewage treatment, *Regional analysis, Legal aspects, Administrative agencies, Administrative decisions, Federal government, Environmental effects, Environmental control, Land use.

Between October, 1977 and June, 1978, a study of floodplain development pressures and federal programs was carried out. Recommended are ways in which the federal Environmental Protection Agency (EPA) can reduce floodplain development pressures caused by the '201' Wastewater Treatment Works Program (WTWP). These recommendations to EPA are based on: (1) 31 case studies of floodplain development pressures in the midwest,

vest, and southeast; (2) meetings with EPA regional offices; (3) interviews with federal officials; nd (4) major decision points in the '201' WTWP vhich can affect floodplain development. The recommendations are: (1) identification of floodplain levelopment pressures during Step 1 facility planning; (2) coordination between the EPA and the Federal Insurance Administration; (3) federal gency coordination for mitigation of floodplain mpact; (4) definition of criteria and standards for loodplain development impacts. Although the tudy's results cannot be generalized to all communities receiving wastewater treatment facilities, the nformation obtained has important implications or the implementation of floodplain development mpact policies by EPA. DIFFUSE SOURCE POLLUTION: POLICY CONSIDERATIONS FOR THE STATES.
Council of State Governments, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-274 493, Price codes: A04 in paper copy, A01 in microfiche. March 1977, 47 p.

Descriptors: *Water pollution sources, *Political constraints, *Regulation, Water pollution, Standards, Control, Monitoring, Institutional constraints, Deterioration.

The control of nonpoint sources of water pollution, or diffuse source pollution, is one of the most pressing environmental issues confronting state governments. The problems and opportunities of implementing successful programs to control diffuse sources are explored. The introduction gives a detailed explanation of what diffuse source pollution is, or the issues involved in managing diffuse source pollution, and the reasons for state concern. Part two explores state and federal programs regulating diffuse pollutions when diffuse source pollution had not yet been recognized as a pollution class. The Clean Air Act and the Federal Water Pollution Control Act, each recognizing a part of the diffuse source pollution issue, are extensively analyzed and criticized. Part three gives suggestions for implementing diffuse source pollution programs. The report calls for the states, in active cooperative partnership with local governments, to take the lead in meeting the problem to prevent a stronger federal role. Realistic and dependable federal finding of state programs and rational federal timing and dead lines are suggested. Included are an appendix suggesting future directions and research agenda, and an extensive bibliography. (Coffey-Florida)
W79-07879

THE NATIONAL FLOOD INSURANCE PROGRAM REVISITED - AN UPDATED MODEL ORDINANCE FOR IMPLEMENTATION OF ITS LAND MANAGEMENT CRITERIA,
Florida Univ., Gainesville.
F. E. Maloney, and D. C. Dambly.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-280 483, Price codes: A03 in paper copy, A01 in microfiche. Florida Sea Grant College Program Technical Paper No. 3, December 1977, 46 p.

Descriptors: *Flood protection, *Flood plain insurance, *Flood plain zoning, *Flood plains, Planning, Land use, Land management, Insurance, Hazards, Regulation, Zoning.

In 1975, a model flood plain zoning ordinance was developed to assist communities in implementing the land management regulations adopted as part of the National Flood Insurance Program (NFIP). In 1976, the Federal Insurance Administration published the final land use regulations adopted under the NFIP Significant differences between the proposed and final regulations led to an updated model ordinance. Included is the entire updated model ordinance with commentary. The Model Flood Plain Management Ordinance contains the following: Section (1) Statutory authorization, findings of fact, purposes and objectives; Section (2) Definitions; Section (3) General provisions, and establishment of official zoning map; Section (4) Administration, creation of the flood plain administrator and flood plain construction authorization permits; Section (5) Establishment of zoning districts; Section (6) Floodway districts; Section (7) Flood fringe districts (FFD), the requirements within FFD, and areas of shallow flooding; Section (8) Coastal high hazard districts (CHH), requirements for development in CHHD's, and guidance of future development; Section (9) Floodproofing; Section (10) Variances, requirements and procedures; Section (11) Nonconforming uses; Section (12) Subdivision regulation in flood hazard zone; Section (13) Penalties for violations; and regulation in flood hazard zone; Section (13) Penalties for violations; and Section (14) Severability. (Fortin-Florida)
W79-07880

MUNICIPAL AND INDUSTRIAL WATER CONSERVATION - THE FEDERAL GOVERNMENT COULD DO MORE,
General Accounting Office, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 487, Price codes: A05 in paper copy, A01 in microfiche. Report to the Congress, April 3, 1978, 39 p, 12 append.

Descriptors: *Water conservation, *Water supply, *Federal government, Water consumption, Water demand, Water pressure, Water shortage, Planning, Water use, Conservation.

An adequate water supply is essential to the nation's citizens and industries. If demand continues to increase, the nation will have to develop new supplies or use existing supplies more efficiently. Although the policy of Congress is that state and local governments are primarily responsible for water supply and regulation of water use, various federal programs offer numerous opportunities for encouraging and implementing water conservation programs. Federal agencies can: (1) provide funds for water resource planning; (2) construct dams and reservoirs to increase the supply; (3) construct and operate buildings and housing where water conservation can be undertaken; and (4) provide grants for construction of wastewater treatment facilities. Conservation is beneficial because it frees present supplies, precludes construction of supply and treatment facilities, and reduces future requirements for wastewater treatment facilities. An overview of opportunities for conserving municipal and industrial water supplies is provided which includes: (1) conservation techniques, including domestic water saving devices, metered usage, pricing structures, leakage control, water pressure control and educational compaigns, and (2) the potential for increased water conservation through existing federal programs. (Fortin-Florida)
W79-07881

WATER RESOURCES PLANNING, MANAGEMENT, AND DEVELOPMENT: WHAT ARE THE NATION'S WATER SUPPLY PROBLEMS AND ISSUES,
General Accounting Office, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 171, Price codes: A04 in paper copy, A01 in microfiche. July 28, 1977, 46 p.

Descriptors: *Water resource development, *Water management, *Water supply development, Water supply, Water demand, Water consumption, Water utilization, Resource allocation, Planning.

While the United States has an abundant water supply, the geographical distribution and availability of its water resources often do not match needs and demands. Existing and emerging water supply problems are identified. The focus is on the water and water-related programs and activities concerned with water resources planning, management, and development projects designed to provide adequate water supplies to meet present and future demands. Water resources planning encompasses assessing quantity and quality of water supplies, forecasting demands, analyzing problems, and preparing proposals for resolving such problems. Water resources management covers water allocation among competing uses, technology development, and implementation of activities to reduce demand and conserve supplies. Water resource development projects are primarily concerned with project formulation, justification and construction. The current drought in the midwest and west with its devastating economic, environmental, and social impacts highlights the seriousness of the water problems facing our nation. Finding solutions to our water problems requires the establishment of clear priorities and timely and responsive implementing programs. (Fortin-Florida)
W79-07882

A REVISION OF EXISTING REGULATIONS OF THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM,
Environmental Protection Agency, Washington, DC.
Federal Register, Vol. 43, No. 162, p 37078-37134, August 21, 1978.

Descriptors: *Discharge, *Federal jurisdiction, *Administration, *Water pollution control, Pollution abatement, Drainage engineering, Administrative agencies, Permits, State governments, Water pollution, Waste water.

Parts of the existing National Pollutant Discharge Elimination System (NPDES) regulations either are too terse to provide meaningful guidance, or leave significant permit-related issues unaddressed. Based upon several years of hearings by the federal Environmental Protection Agency the proposed regulations for part 124 provide more detailed procedures; parts 122 and 125 provide guidance on substantive questions formerly unaddressed in regulations. Accordingly four new parts of title 40 have been established, incorporating all of existing parts 122, 123, 124, 125 and 402, and portions of $6.900. There were three purposes behind these extensive revisions: (1) To clarify and improve existing program regulations and procedures in light of past experience; (2) To fill in significant gaps in coverage under existing regulations, particularly in response to court decisions and emerging emphasis on the control of toxic and hazardous pollutants; and (3) to make the necessary regulatory changes under the 1977 amendments to the Clean Water Act. (Fortin-Florida)

FEDERAL WATER POLLUTION CONTROL ACT CONSTRUCTION GRANTS,
Environmental Protection Agency, Washington, DC.
Federal Register, Vol. 43, No. 80, p 17690-720, April 25, 1978.

Descriptors: *Federal water pollution control act, *Water pollution control, *Grants, *Administrative agencies, Regulation, Environmental control, Administration, Pollution abatement, Water pollution, Water policy, Contract administration.

These proposed changes to the regulations governing grants for construction of publicly-owned treatment works are intended to implement certain amendments to sections 201 (g), 201 (i), 202 (a), 203 (e) and 304 (d) of the Federal Water Pollution Control Act (FWPCA). The proposed regulations involve innovative and alternative technologies, recreational and open space uses and the provision of assistance by the federal Environmental Protection Agency (EPA) to grant recipients. Regulations that implement amendments to the FWPCA which affect waste water treatment works construction grant programs are administered by the EPA. These regulations deal primarily with the following subjects: (1) State priority; (2) grant eligibility categories; (3) Land eligibility; (4) user charges; (5) industrial cost recovery; (6) grants for

individual systems; (7) combined steps 2 and 3 grants; (8) training facility grants; (9) Buy America, cost-effectiveness analysis; and (10) reserve capacity. An interim regulation implements section 205 (g) of the FWPCA. These regulations make funds available to states to manage the construction grant program, to hire qualified staff and to provide training necessary to effectively carry out delegated functions. (Fortin-Florida)

THE ECONOMIC IMPACT OF ALTERNATIVE CYANIDE STANDARDS IN ILLINOIS,
IIT Research Inst., Chicago, IL.
L. Huff, and J. Huff.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 179, Price codes: A13 in paper copy, A01 in microfiche. Illinois Institute for Environmental Quality Doc. No. 77/3, March, 1977, 288 p.

Descriptors: *Illinois, *Standards, *Effluents, *Water pollution, *Environmental effects, Economics, Economic impact, Cost-benefit analysis, Chemical wastes, Water quality control, Water quality standards, Regulation, Industrial wastes.

The objective of effluent and water quality standards is protection of the rivers and the streams and their bodie biota. Modifications to the present cyanide effluent standard have been proposed by the Illinois Petroleum Council, Metropolitan Sanitary District of Greater Chicago, and Republic Steel. To determine an appropriate standard based on an economic analysis, the magnitude of the existing problem was delineated. Four major segments discharge cyanide in Illinois: (1) steel producing; (2) petroleum refining; (3) platers; and (4) municipalities. Seventy dischargers in 10 categories were committing cyanide discharge violations. Effluent regulations are used to maintain a certain level of water quality. Such regulations impose costs on one group while others benefit from the water quality. Complete waterway protection for all uses is attained at the most stringent effluent standard. At increasing effluent levels, some incremental damage may occur to the environment. The existing cyanide effluent standard, if rigorously enforced, will result in substantial monetary loss in Illinois industrial output. With a standard allowing more effluent the decrease in costs imposed is greater than the increase in possible environmental damage. (Ewing-Florida)

WETLANDS RELATED LEGISLATION IN THE UNITED STATES,
Miami Univ., Coral Gables, FL. School of Law.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 660, Price codes: A05 in paper copy, A01 in microfiche. Sea Grant Special Report No. 11, May, 1977. 14 p, 1 append.

Descriptors: *Wetlands, *Legislation, *Regulation, *Coasts, State governments, United States, Water policy, Administrative agencies, Land management, Land use, Marshes, Swamps.

Commensurate with increased concern for the environment is a growing realization of the need for special protection of certain areas that have exceptional environmental importance. Wetlands in their natural state serve a number of important functions for both man and the general environment. Largely unbridled and unregulated development resulted in destruction of large wetlands areas. State legislatures gradually responded to the public outrage that followed. Several methods of general administration of wetlands legislation are described and discussed. A state regulation for the protection of wetlands may constitute a taking of a landowners property for which just compensation is required. A taking occurs under the 14th Amendment when the regulation deprives a landowner of all reasonable (economical) use of his property. Arranged in a state-by-state order, this publication lists statutes, provides definitions, explains briefly prohibited activities, lists administrative schemes and gives standards for the use and development of both inland and coastal wetlands of the United States. UPDATING GROUNDWATER LAW: NEW WINE IN OLD BOTTLES,
R. J. Adams.
Ohio State Law Journal, Vol. 39, No. 3. p 520-41, 1978.

Descriptors: *Ohio, *Groundwater, *Groundwater resources, Water supply, Water shortage, Water policy, Water law, *Water allocation(Policy), Water resources, State governments, Legislation, Common law.

There has been considerable talk of an impending water crisis. Groundwater may be called upon to fill an increasing proportion of total water demand. Groundwaters are typically usable without the vast expenditures necessary to build dams and acquire surface acreage to be flooded. Groundwaters frequently have useful characteristics not shared with surface waters: (1) uniformity of temperature and composition and (2) relative freedom from pollution. Groundwater use is increasing at a rate faster than surface water use. This has heightened concern in Ohio about the ability of common-law rules to continue beneficial, efficient and equitable distribution of existing groundwater resources. Concern about conflicts between competing users resulted in new legislation which allows the Ohio Division of Water to intercede as a fact finder, but which does not affect the legal rules for allocating groundwater. A fundamental allocation question has become more important: Should Ohio continue to distribute groundwater according to the presently used absolute ownership rule. The 'knowledge doctrine' should be adopted. This doctrine is easily integrated with surface water management rules, and is consistent with the common law and Ohio law. (Ewing-Florida)

WATER WAY PRESERVATION: THE WILD AND SCENIC RIVERS ACT OF 1968,
S. K. Goodell.
Boston College Environmental Affairs Law Review, Vol. 7, No. 1, p 43-82, 1978.

Descriptors: *Rivers, *River regulation, *Wild river act, *Ecology, Water law, Legal aspects, Conservation, Federal government, State governments, Legislation, Regulation, Environmental effects.

This country's rivers have fallen victim to excessive industrialization, abusive land use, and an overall move to commercialize the recreational value of free-flowing rivers. In 1968, Congress passed the Wild and Scenic Rivers Act to prevent the decay of free-flowing rivers. Many states have responded with 'mini-wild and scenic river systems.' This response has created a fairly comprehensive regulatory network with the potential to protect many valuable waterways. The federal wild and scenic rivers system and its impact on waterway preservation over the last ten years are reviewed. The legislation's mechanics are analyzed with emphasis on two major problems: delays and increased costs. Causes of these problems are discussed and solutions suggested. Various state systems are surveyed. In particular, the Oregon wild and scenic rivers program is examined to consider the possible application of certain state preservation devices to the federal system. Realizing the delicate balance between the conservation efforts of the Act and conflicting private property interests is discussed in the context of the New River controversy - an example of the problems created when the equilibrium between these two interests is disturbed. (Ewing-Florida)

GROUND AND SURFACE WATER IN NEW MEXICO: ARE THEY PROTECTED AGAINST URANIUM MINING AND MILLING,
K. K. Townsend.
Natural Resources Journal, Vol. 18, No. 4, p 941-62, October, 1978.

Descriptors: *New Mexico, *Groundwater, *Water pollution, *Uranium radioisotopes, Legislation, Environmental effects, Federal water pollution control act, Water pollution sources, Legal aspects, Effluents, Water law.

The uranium companies' methods of mining, milling, and waste disposal affect both surface and ground waters in New Mexico. Both federal and state legislatures have enacted statutes, the Federal Water Pollution Control Act (FWPCA) and the N. M. Water Quality Act, intended to balance the need to protect water with the need to produce uranium. The federal Environmental Protection Agency is reluctant to incorporate the New Mexico's groundwater regulations and control discharges upstream from the National Pollution Discharge Elimination System outfall. This reluctance exemplifies one of the major difficulties in controlling uranium companies-lack of resources. Another problem is that uranium companies can prolong adjudicatory hearings for many years, and may successfully thwart the state's regulation. If the New Mexico court is swayed by the companies' argument, it may be another five years until discharges are controlled. Both the federal act and state regulations should be much stronger. Discharges to groundwater should be controlled by the FWPCA. (Ewing-Florida)

SAVING THE COAST: THE BRITISH EXPERIENCE,
Saint Catherine's Coll., Cambridge (England).
J. A. Steers.
Coastal Zone Management Journal, Vol. 4, No. 1/2, p 7-22, 1978, 1 fig.

Descriptors: *Foreign countries, *Coasts, *Conservation, Ecology, Shores, Environment, Environmental effects, Planning, Protection, Land resources.

since the mid-twentieth century, steps have been aken to conserve the Great Britain coast. Official nd unofficial bodies have interacted to try to save he coast. Prior to 1965, the National Parks Com-nittee and Nature Conservancy worked as inde-endent bodies with coastal conservation and pro-ection at the forefront of their activities. In 1965, he National Environment Research Council was reated to encourage and support research in the arth sciences and ecology, disseminate advice and nowledge, establish and manage nature reserves, nake grants and appoint committees. National and ocal trusts have also played an important role in aving parts of the coast. Many local coastal re-erves are concerned with smaller areas. Many nstances of coastal alteration can be cited, includ-ng planned residential development and the results f oil discovery. The country is now aware of langers which could result from such changes. The essential point is that all interests must be liscussed and assessed before any part of the coast s to be developed. (Ewing-Florida)
W79-07899

RE-EMERGENCE OF A CONTROVERSY: EN-FORCING ACREAGE LIMITATION,
C. H. Coleman.
Harvard Environmental Law Review, Vol. 2, p 329-41, 1978.

Descriptors: *Agriculture, *Land use, *Water users, *Irrigation, Judicial decisions, Administrative agencies, Farms, Cost-benefit theory, Environmental effects, Legislation.

In 1902, Congress passed the Reclamation Act. The purpose was to encourage the development of small family farms in the west. The Act required water users to reside on the irrigated land and limited to 160 acres the amount of land any one landowner could irrigate with federally-provided water. Some felt the Act was unenforceable, and hampered economically-efficient agricultural development. Others believed it the best means of preventing monopoly of land and water. An uneasy compromise resulted. Neither provision was repealed, but the pattern of enforcement included many special exemptions and modifications, listed here. Three court decisions and Department of Interior's proposed regulations indicate a trend toward a stricter enforcement policy. The implications of the recent decisions, including their potential impact on the environment, are explored. The stricter enforcement policy raises difficult questions, such as, how widespread the effects of the proposed rules will be, whether advances in farm technology have made 160-acre farms economically unfeasible, and whether the federal government should continue to subsidize project-water users. (Horwich-Florida)
W79-07900

WATER LAW PROBLEMS OF SOLAR HYDROGEN PRODUCTION,
M. M. Eisenstadt.
Natural Resources Journal, Vol. 18, No. 3, p 521-44. July, 1978.

Descriptors: *Hydrogen, *Water utilization, *Energy, *Energy conversion, Federal water pollution control act, Prior appropriation, Brackish water, Acquifers, Surface water, Water law, Water supply, Water demand, Economics.

Solar energy is a prime candidate as a source for hydrogen production. The areas of the United States that receive the most sunlight are the southwestern states and Florida. If hydrogen economy becomes a reality and southwestern surface water is used for hydrogen production, the water requirements could dry up the southwestern rivers. The economic and technological aspects of the problems involved in using brackish water, from isolated acquifers, for hydrogen production indicate that both the water and technology are presently available. The legal problems are no more complicated than those dealing with surface water. While the cost of using brackish water would be slightly higher than that of fresh water, the cost might be justified, for brackish water would prevent damage to both the ecology and southwestern citizens' lifestyle. Under its police power, the federal government could acquire as much surface water as needed to produce hydrogen. Commentators say the environmental damage must be balanced against the economic advantage of using surface water instead of brackish groundwater. (Fortin-Florida)

ACREAGE AND RESIDENCY LIMITATIONS IN THE IMPERIAL VALLEY: A CASE STUDY IN NATIONAL RECLAMATION POLICY,
A. K. Kelley.
South Dakota Law Review, Vol. 23, No. 3, p 621-61, Summer, 1978.

Descriptors: *Reclamation, *Irrigation, *Judicial decisions, Irrigation programs, Legislation, Arid lands, Water delivery, Water distribution, Legal aspects, Water policy, Water resource development.

Since the turn of the century, irrigation in the arid areas of the western United States has become important. Much of the irrigation is made possible by federal reclamation projects. A controversial issue that arises regularly is who shall benefit from the water provided from these projects. Parties ranging from large corporate agricultural combines to the poorest of migrant farm workers have become aware of the opportunities presented by this 'liquid gold'. The areas receiving the greatest amount of commentary are the acreage limitation and the residency requirement, which limit water delivery from federal reclamation projects. In the case of United States v. Imperial Irrigation, the Ninth Court of Appeals had to decide whether restrictions should be placed upon water delivery in the prosperous Imperial Valley. Unfortunately, the court used an inflexible standing test to avoid analyzing the extremely significant residency requirement issue. The court's treatment of the acreage limitation question, demonstrated a proper recognition of the vital policies forming the foundation of the reclamation laws. (Fortin-Florida)

RESERVED WATER RIGHTS, INDIAN RIGHTS AND THE NARROWING SCOPE OF FEDERAL JURISDICTION: THE COLORADO RIVER DECISION,
Wayne State Univ., Detroit, MI. Coll. of Law.
R. H. Abrams.
Stanford Law Review, Vol. 30, No. 6, p 1111-48, July, 1978.

Descriptors: *Federal-state water rights conflicts, *Water rights, *Federal jurisdiction, Judicial decisions, Jurisdiction, Water law, Indian reservations, State jurisdiction, Federal government, Arid lands.

In 1976, the United States Supreme Court decided Colorado River Water Conservation District v. United States. The court held that principles of judicial administration relating to the 'contemporaneous exercise of concurrent jurisdictions' require that federal courts abjure congressionally granted, previously-attached jurisdiction of federal claims to reserved water rights. By establishing state courts as the primary forum for adjudicating all water rights within state boundaries, this decision dramatically extends state courts' control over reserved rights claims. This includes claims by the federal government as trustee for American Indian lands withdrawn by treaty or other congressional action. Although the decision did not abolish concurrent jurisdiction, it virtually assured adjudication of all claims in state courts. State courts may discriminate against federal claims in favor of state and private uses. The arguments favoring a federal forum are especially strong for reserved rights claimed on behalf of American Indians. Either the Court should reexamine the Colorado River decision, or, Congress should clarify the McCarron Amendment. Otherwise, the federal district courts must strike a new balance on a case-by-case basis, by declining to dismiss or remand Indian reserved rights claims. (Fortin-Florida)

CAPPAERT V. UNITED STATES: A DEHYDRATION OF PRIVATE GROUNDWATER USE,
M. P. Bouret.
California Western Law Review, Vol. 14, No. 2, p 382-417, 1978.

Descriptors: *Federal-state water rights conflicts, *Groundwater, *Water rights, *Reservation doctrine, Federal government, State governments, Judicial decisions, Implied benefits, Arid lands, Underground, Prior appropriation.

During the last twenty years, the relationship between the western states and the federal government regarding water rights has steadily deteriorated. The problem was recently exacerbated by the United States Supreme Court in Cappaert v. United States. The Court held that when the federal government established Devils' Hole National Monument in Nevada, it impliedly reserved rights to unappropriated underground water which could not be lawfully encroached upon by adjacent landholders. The implied reservation doctrine was expanded for the first time to underground waters. When the federal government reserves land, it also reserves sufficient water to accomplish the purpose for which the land was taken. Landowners adjacent to the federal reservation have no idea how the governments' needs will affect their water supply until notified that their water use must be stopped or curtailed. This may be a taking of lands without prior notice and any compensation. The future demand for underground water supplies in the public and private sectors mandates a quantification of recordation of, and compensation for surface and underground water rights. (Fortin-Florida)

ACID COAL MINE DRAINAGE: PAST POLLUTION AND CURRENT REGULATION,
West Virginia Univ., Morgantown. Coll. of Law.
P. C. McGinley, and J. J. Sweet.
Duquesne Law Review, Vol. 17, No. 1, p 67-97, 1978-79.

Descriptors: *Acid mine water, *Mine acids, *Mine drainage, Mine waters, Mine wastes, Federal water pollution control act, Mining, Pollutants, Water pollution, Water pollution effects.

A cornerstone of the Carter Administration's energy program is the use of the country's extremely large bituminous coal reserves as a primary fuel source. The coal fuel cycle has an impact on air, water and land quality, and plant and animal life. Perhaps the most serious environmental problem with the mining of bitumenous coal is the production of the ecologically damaging acid mine drainage (AMD) from deep and surface mines. An analysis of the early AMD cases suggest a judicial acceptance of the inevitability of such pollution. A practical and economically feasible method of treatment or abatement was not believed to exist. The court's failure to impose effective restraints on coal operators for AMD pollution, which occurs during and after mining, provided the coal industry substantial incentive to develop new abatement technologies. Only since the enactment of the Federal Water Pollution Control Act and vigorous enforcement of state environmental protection laws have great strides been made in developing and applying effective AMD abatement technology. RECENT CONGRESSIONAL ACTION ON OUTER CONTINENTAL SHELF OIL AND GAS DEVELOPMENT,
F. Craft, Jr.
Tulsa Law Journal, Vol. 13, No. 4, p 742-50, 1978.

Descriptors: *Continental shelf, *Legislation, *Oil, Coasts, Oil wells, Legal aspects, Administrative agencies, State governments, Federal jurisdiction, Federal state water rights conflict.

The energy crisis has increased the demand for oil and gas production from the ocean floor adjoining the United States coast. These demands conflict with the need to avoid ocean pollution and pre-

serve the coastal environment. The issue is further aggravated by jurisdictional assertions between the federal and state governments and among member nations which will meet at the 1978 United Nations Conference on the Law of the Seas. The relevant issues in the Outer Continental Shelf bill are: (1) whether to lease before or after all environmental questions are answered; (2) whether to accelerate or halt leasing until the need has been thoroughly demonstrated; (3) how much influence state and local governments should have in development; (4) what revisions of the bidding system are necessary; and (5) what types of antitrust reviews should be available. Unfortunately, Congress to date has ignored the need to increase domestic production. Congress is still preoccupied with enacting environmental legislation which grew out of the causes of the early 1970's. (Fortin-Florida)

ASSESSMENT OF CIVIL MONETARY PENALTIES FOR WATER POLLUTION: A PROPOSAL FOR SHIFTING THE BURDEN OF PROOF REGARDING DAMAGES,
D. P. Taylor.
Hastings Law Journal, Vol. 30, No. 3, p 651-82, January, 1979.

Descriptors: *Water pollution, *Damages, *Penalties, *Economics, Water quality, Legislation, Judicial decisions, Administrative agencies, Effluents, Cost allocation, Compensation.

The issue of assessing and imposing the appropriate amount of civil and monetary penalties for violation of water quality statutes is not unique to California; it arises in many other states and at the federal level because such penalties have become a key enforcement remedy in environmental legislation. Depending on the particular statutory scheme, such penalties may be assessed and imposed by administrative agencies or by the courts. The efficiency of the penalties is determined largely by the method of assessment and imposition used. Uncertainty often arises in judicial assessment proceedings because it is unclear what need be proved and by whom under the penalty statute. Effective water pollution enforcement will be frustrated of the state is required to bear the burdens of proof concerning damages. The proposal is that a showing of statutory violation would raise a rebuttable presumption of a maximum $10,000 per day penalty. This amount is considered appropriate to deter future violation and compensate for unquantifiable harm. The polluter then must prove a lower amount was warranted. (Fortin-Florida)

PROTECTING MASSACHUSETTS WETLANDS,
Suffolk Univ., Boston, MA.
A. D. Dawson.
Suffolk University Law Review, Vol. 12, No. 4, p 755-95, 1978.

Descriptors: *Regulation, *Wetlands, *Floodplains, *Massachusetts, Land fills, Coastal marshes, Zoning, Permits, Floods, Flood control, Flood protection, Water supply, Natural resources, Marshes, Compensation, Excavation, Shores, Navigable waters, Tidal waters, Constitutional law.

Massachusetts has enacted a variety of laws designed to protect wetlands and floodplains. State and local regulatory activity has produced much litigation. Massachusetts' case law may foreshadow decisions elsewhere as environmental laws collide with the expanding interests of private landowners. Massachusetts cases and references to the decisions from other states that have most influenced Massachusetts courts in providing wetland protection are concentrated upon. There are four parts: (1) an overview of Massachusetts statutes; (2) a discussion of judicial decisions concerning wetlands, including a detailed analysis of the most recent case, MacGibbon v. Board of Appeals of Duxbury (MacGibbon III). MacGibbon III may signal a reversal of the liberal trend regarding the taking issue in environmental cases; (3) a comparision of MacGibbon III with other states' decisions; and (4) a summary of lessons derived from Massachusetts cases and statutes, which may be useful to lawyers, legislators and administrators who seek to protect wetlands through governmental regulation. CURRENT GROUNDWATER LAW IN ARIZONA,
M. N. Goodman.
Arizona State Law Journal, Vol. 1978, No. 2-3, p 205-24, 1978.

Descriptors: *Arizona, *Groundwater, *Legislation, *Regulation, Legal aspects, Water law, Water policy, Water supply, Federal government, State governments.

The state of groundwater law in Arizona has never been certain. Historical developments are unraveled to determine whether they are useful in interpreting the 1977 Groundwater Act (Act) in developing a sound water policy for the future. Three aspects of the Act apt to provoke more litigation are examined. These provisions relate to: (1) groundwater transfers; (2) rights, liabilities and remedies under the Act; and (3) a moratorium on the establishment of additional critical groundwater areas. The Groundwater Management Study Commission created by the Act and the constitutional problem it raises are viewed. The implied reservation problem resulting from the federal litigation is discussed. The Arizona legislature has acted occasionally to relieve the pressures created by the water scarcity, but it appears to act more out of desperation than determination to resolve a serious problem. The Act is no exception. It is a stop-gap measure which seems to raise more problems than it solves. (Ewing-Florida)

FEDERAL ENFORCEMENT PROCEEDINGS UNDER THE 1977 CLEAN WATER ACT,
S. L. Hartman.
Temple Law Quarterly, Vol. 51, No. 4, p 884-911, 1978.

Descriptors: *Federal government, *Legislation, *Regulation, *Water pollution control, Federal water pollution control act, Water quality control, Waste treatment, Legal aspects, Water law, Standards, Water pollution.

The 1977 Clean Water Act (CWA) amended the Federal Water Pollution Control Act (the Act). The amendments' enactment signified a growing Congressional awareness that cleaning up this nation's waters will be a more complex task than initially anticipated. The failure of the Act to provide for flexibility in enforcing 1977 deadlines would have created a near impossible task for the federal Environmental Protection Agency and the courts. While addressing itself to the problem of such inflexibility, the CWA has serious deficiencies. Congress has given relief to sewage treatment works unable to achieve compliance due to inadequate or nonexistent federal funding, but the relief was only helpful to relieve past funding deficiencies. The relief does not extend to future difficulties. Although state and federal roles in the National Pollutant Discharge Elimination System program have been clarified, the CWA provides no guidance if permits or guidelines are issued in an untimely manner. To the extent that these problems remain in the Act, Congress has failed to ease the burden on the administrative and judicial processes. (Ewing-Florida)

THE LOSS OF PUBLIC TIDELANDS TO PRIVATE PARTIES THROUGH UNCONSTITUTIONAL LAND TRADES,
L. Martyn, and H. Bohner.
San Francisco University Law Review, Vol. 13, No. 1, p 39-61, 1978.

Descriptors: *California, *Coasts, *Land resources, *Public rights, Public lands, Legal aspects, Legislation, Constitutional law, Control, Judicial decisions, Conservation.

In 1850, California became the owner of all the land in the state subject to the ebb flo and flow of the tide. These public tidelands are being filled and lost to private development despite provisions of the California Constitution which prohibit private ownership and monopoly of the tidelands. If the provisions of the California Constitution were enforced, loss of the tidelands to private development could be substantially reduced or halted. The loss of the tidelands is due, at least in part, by the state's failure to properly map and inventory its tidelands and by unconstitutional exchanges of tideland between state and private developers. Measures could be taken to alleviate further inroads into public trust lands: (1) Public Resources Code section 6307, authorizing exchange of state-owned lands for private lands of equal value, should be declared unconstitutional; (2) courts should stringently review any legislative determination freeing tidelands from the public trust; and (3) revenue from oil and minerals derived from patented tidelands should belong to the state tidelands trust fund. PUEBLO INDIAN WATER RIGHTS: WHO WILL GET THE WATER,
A. P. Maynez.
Natural Resources Journal, Vol. 18, No. 3, p 639-58, 1978.

Descriptors: *New Mexico, *Pueblo water rights, *Reservation doctrine, Water law, Judicial decisions, Legal aspects, Appropriation, Federal-state water rights conflicts, Federal government, Water control.

The basic issue before the court in New Mexico v. Aamodt was whether Pueblo water uses were controlled by state water law based on the doctrine of prior appropriation. The court held that pueblo water rights were not subject to state law. Court decisions have placed the pueblos firmly under the protection of the federal government. The court suggested that the pueblo water rights may be reserved rights. The landmark case defining reserved rights is Winters v. United States. The Winters Doctrine states that a land reservation established by treaty carries with it an implicit reservation of water, the amount being determined by the purpose of the reservation. The doctrine has not been confined to lands reserved by treaty. The court's suggestion, that the Pueblos may have reserved rights, may become the formulation of a new test. Under this test, the existence of such a right depends not upon whether there is a federal land reservation but upon whether there is federal control through guardianship over the land. This new test is a logical extension and refinement of the Winters Doctrine. (Ewing-Florida)

GROUNDWATER - A FILTER FOR A MUDDY ISSUE. (LANDOWNERS' RIGHTS TO GROUNDWATER AS GOVERNED BY THE NEBRASKA PREFERENTIAL USE STATUTE),
A. R. Bosch.
Creighton Law Review, Vol. 12, No. 1, p 431-45, Fall, 1978.

Descriptors: *Nebraska, *Groundwater resources, *Water allocation(Policy), Water policy, Water supply, Water resources, State governments, Judicial decisions, Legal aspects, Groundwater.

In the recent case of Prather v. Eisenmann, the Nebraska Supreme Court clarified Nebraska law on groundwater use. There are four basic legal theories governing groundwater use: (1) the English/absolute ownership rule; (2) the American/reasonable use rule; (3) the California/correlative rights doctrine; and (4) the prior appropriation rule. The English rule states that the landowner has an absolute right to take the water beneath his land for any use, regardless of the effect on an adjoining landowner. The American rule limits a landowner's use to beneficial purposes having a reasonable relationship to his overlying land, regardless of the effect on the water supply to adjacent landowners. The correlative rights doctrine gives each landowner an equal and correlative

right to make beneficial use of the groundwater. The prior appropriation doctrine grants priority to the first person who adopts a beneficial use of the water. Although Prather discussed the development of groundwater law, the decision was based soley on the Nebraska Preferential Use Statute which provides that preference in the use of underground water shall be given to those using the water for domestic purposes. PROPOSED RULES FOR ADMINISTERING THE ACREAGE LIMITATION OF RECLAMATION LAW,
N. Jones.
Natural Resources Journal, Vol. 18, No. 4, p 933-40, October, 1978.

Descriptors: *Reclamation, *Regulation, *Legislation, *Irrigation water, Federal government, Judicial decision, Legal aspects, Irrigated land, Irrigation, Land use, Administration.

In a recent Ninth Circuit Court opinion, the limitation on land an individual may own in an irrigation district receiving federal reclamation water was applied to California's Imperial Irrigation District. The current acreage limit of 160 acres was adopted in the 1926 Omnibus Adjustment Act, but has not been enforced. Pursuant to court order, the Bureau of Reclamation has proposed rules for enforcement of the acreage limitation. The rules restate the purpose of the limitation: (1) to provide for a maximum number of farmers; (2) to widely distribute the benefits; (3) to promote family-sized owner-operated farms; and (4) to preclude speculation. Lands exceeding the acreage limitation may only receive water if the owner executes a recordable contract for sale of that land. Availability notices are then published and the land sold at an approved price. The proposed rules would also: (1) tighten the criteria for eligible purchasers; (2) provide for impartial selection of purchasers; and (3) restrict leasing of the excess lands. Sale and resale prices are subject to approval. Enforcement will meet serious opposition and may disrupt agricultural operations. Such a change in land-use patterns may be unfeasible for present farming methods. (Ewing-Florida)

ACID MINE DRAINAGE AND THE CLEAN WATER ACT,
Maryland Dept. of Natural Resources, Annapolis. Water Resources Administration.
S. S. Golfman.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 112-113. Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2.

Descriptors: *Mine drainage, *Legislation, *Federal Water Pollution Control Act Amendments of 1972, *Pollution abatement, *Water pollution control, Mine wastes, Acid mine water, Water pollution, Water pollution sources, Financing, Government finance, Government support, Maryland.

Active and abandoned mines are given consideration in the water quality management plans to be developed by each State under the Federal Water Pollution Control Act Amendments of 1972 (P.L. 92-500). In Maryland the Bureau of Mines of the Energy and Coastal Zone Administration is responsible for controlling abandoned mine drainage, and water quality associated with active mines is charged to the Water Resources Administration Section 208 of P. L. 92-500 requires the development and implementation of a management plan to identify mine-related sources of pollution, including abandoned surface and underground runoff, and to prescribe methods and procedures to control them. The Federal government provides funds for mine water pollution control demonstrations under Section 107 of P. L. 92-500, but no implementation funds are provided to correct pollution from abandoned mines. The demonstration funds have been used by Maryland and other States to aid in developing abatement techniques. Maryland acknowledged that the responsibility for abandoned mine pollution is statewide by enacting the Abandoned Mine Drainage Control Act, which authorized the prevention, control, and abatement of pollution from abdandoned mines, and provided $5 million to implement the provisions. Other legislation provides for a surcharge of 15 cents/ton of coal mined to be leveled, and a fee of $40/acre of affected land surface to provide a continuous flow of funds for abatement projects. The State will match each $40 put into the fund. (Davison-IPA)

CONGRESSIONAL PERSPECTIVES ON CLEAN WATER,
Committee on Environment and Public Works (U. S. Senate), Washington, DC.
P. T. Cummings.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 179-181. Interstate Commission on the Potomac River Basin, Rockville Md. Technical Publication 78-2.

Descriptors: *Water pollution control, *Pollution abatement, *Legal aspects, *Legislation, *Water Pollution Control Act Amendments of 1972, Water quality control, Water quality standards, Water pollution sources, Committee on Environment and Public Works, Potomac River basin.

The legislative intent behind the 1972 Federal Water Pollution Control Act Amendments (P. L. 92-500) is examined. The full implications of the Act and its philosophy are contained in its first sentence: 'The object of this Act is to restore and maintain the chemical, physical and biological integrity of the Nation's Waters.' That congress has declared water pollution illegal is implicit in the no discharge goal of Section 101. To implement the basic decision that the Nation's waters are not to be used for waste disposal, Congress established regulatory and enforcement strategy and a system of subsidies to localities to aid in achieving the goals of the Act. The three basic principles in the act are: (1) to protect and restore the integrity of the natural systems in the Nation's waters, (2) man's activities are presumed to interfere with the Act's objective, and (3) the burden lies on the person who wishes to put something in the water to show that he will not interfere with the means to attain the Act's goals. The intent is to try to make man's activities compatible with the Act rather than restoring Pre-Columbian America. Issues before the Committee on Environment and Public Works for 1977 and 1978 include a review of the act, the mechanisms available for controlling nonpoint sources of pollution, funding of controls for storm-water run-off, the bioaccumulation and persistence of toxic pollutants, and acid mine drainage. PROTECTING AQUATIC LIFE: WHAT CAN THE LAYMAN DO,
E. Wesely.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 182-184. Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2.

Descriptors: *Aquatic life, *Preservation, *Protection, *Attitudes, *Social function, Psychological aspects, Social values, Decision making, Social impact, Environmental effect, Social participation, Ecology, Pollution abatement, Water pollution control, Water quality standards.

A board member of the C and O Canal Association expresses his ideas and philosophy concerning the layman's role in protecting aquatic life. Examples are presented of lay participation in preventing the enactment of legislation which would result in environmentally harmful consequences, and grass roots action to seek environmental preservation through legislation. It is thought that a skeptical attitude toward professional studies will aid the layman in maintaining his objectivity with regard to studies which appear to distort his own observations. In testimony before the Maryland Public Service Commission a representative of an institution which had monitored the aquatic environment of the Potomac River at the site of an electric powerplant for several years stated that the plant's discharge water was never sampled. Laymen sampled the plant's discharge plume in preparing evidence for the same hearing. Laymen also produced evidence that the electric power company had been discharging waste fly ash into the C and O Canal for several years. These and other examples of laymen monitoring institutional activity indicate that the role of the layman in protecting the environment is that of the 'watch dog'. (Davison-IPA)

LEGAL AND SCIENTIFIC PERSPECTIVES,
Environmental Defense Fund, East Setauket, NY. Eastern Water Resources and Land Use Program.
J. T. B. Trip, and R. H. Harris.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. D. and Mason, W. T., Eds., 1978. p 185-189, 4 tab, 14 ref. Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2.

Descriptors: *Federal Water Pollution Control Act Amendments, *Planning, *Water pollution control, *Pollution abatement, *Water quality, *Water quality standards, Water pollution, Management, Legal aspects, Water resources, Protection.

The Potomac estuary is extremely polluted from nutritional inflows from the upper basin, combined sewer discharges in the metropolitan area, and direct discharges from sewage plants. At present no comprehensive plan exists for protecting biological resources, yet waste water treatment plants are being designed and constructed and decisions are being made about the location of discharges to the Potomac basin. Control of toxic pollutants into the Potomac River is essential to protect the biological resources, but little effort has been made to identify and control them, and EPA has not given much guidance in dealing with them. Due to lack of an effective plan to achieve the water quality as set forth in the 1972 Federal Water Pollution Control Act Amendments (FWPCAA), EPA denied application for a construction grant for the Dickerson treatment plant in Montgomery County, Maryland. This is expected to accelerate consideration of land treatment and other alternatives which will meet the standards. It is concluded that the Potomac's ability to support its intended use will not be restored with current waste water management plan development, but that proper waste water management planning as required by the FWPCAA can provide the correct basis for solving the problems. VOLUME III. THE WETLANDS/EDGES PROGRAM. RESEARCH ON THE CHESAPEAKE BAY TO PROVIDE A KNOWLEDGE BASE FOR PHYSICAL ALTERATIONS OF THE EDGES OF THE CHESAPEAKE BAY,
Chesapeake Research Consortium, Inc., Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-279 117, Price codes: A03 in paper copy, A01 in microfiche. Interim Progress Report, February 15, 1974. 32 p, 7 append. NSF/RANN 38973.

Descriptors: *Water resources development, *Shore protection, *Chesapeake Bay, *Permits, *Assessment, Water resources, Water pollution, Wetlands, Shores, Coasts, Environmental effects, Topography, Geomorphology, Analysis, Evaluation, Regulation, Land use, Sedimentation, Erosion.

The design and composition of the program, technical accomplishments, and delivered products concerned with development of criteria for the incremental alteration in the edges of the Chesapeake Bay are presented. Progress of the shoreline situation is also reported. The approach involves: (1) a comprehensive analysis of permit applications for physical alteration of the edges of Chesapeake Bay (approximately 2,000) received by the Corps of Engineers during 1973, (2) detailed case studies of a representative set of permit applications, and (3) specific research projects designed to provide information identified as urgently needed by regulatory agencies for permit proposal decisions. Shoreline studies attempt to obtain a useful characterization and analysis of Chesapeake Bay shorelands with respect to morphological type, land use, and erosion and sedimentation characteristics. Currently, work is focused on the assessment of lower bay shorelands on a county-by-county basis. (Bollinger-Mass)

AN EMPIRICAL TRANSPORT MODEL FOR EVALUATING ENTRAINMENT OF AQUATIC ORGANISMS BY POWER PLANTS,
National Power Plant Team, Ann Arbor, MI.
J. Boreman, C. P. Goodyear, and S. W. Christenson.
Report No. FWS/OBS-78/90, November 1978. 80 p, 14 fig, 11 tab, 12 ref, 3 append.

Descriptors: *Mathematical models, *Entrainment, *Aquatic animals, *Environmental effects, Mortality, Fish populations, Distribution patterns, Life cycles, Growth stages, Aquatic habitats, Movement, Shellfish, Water pollution effects.

A generalized mathematical model incorporating empirically derived organism distribution and movement characteristics is developed for assessing the impact of powerplant entrainment mortality on fish and shellfish populations. The early life stages of these aquatic organisms which inhabit the adjacent water body or use the area as a spawning or nursery habitat are of particular concern. Estimating the conditional entrainment mortality rate, that fraction of the population which would be killed due to entrainment in the absence of any other source of mortality, is the first step in assessing the impact of entrainment mortality. The mathematical formulation is presented in which the mortality rates due to natural causes and entrainment are time-, space-, and age-specific. The input data needed involves: specifying geographic regions within the water body to define the movement and distribution of the organisms while they are vulnerable to entrainment; estimating physical factors; determining entrainment susceptibility for the life stages in each region as a function of calendar time; determining the length of time of organism vulnerability; and calculating life stages distribution among the regions of the water body as a function of calendar time. The model is applied to a hypothetical example. The limitations in the application of this model include the inability of current technology to separate the processes of mortality and movement of entrainable organisms, and the use of distribution data collected under specific conditions which may vary from year to year. THE APPLICATION OF AERIAL AND SATELLITE SNOW-MAPPING TECHNIQUES FOR MULTI-PURPOSE RESERVOIR SYSTEM OPERATIONS IN ARIZONA,
Salt River Project, Phoenix, AZ; and Geological Survey, Phoenix, AZ. Water Resources Div.
E. Kirdar, H. H. Schumann, and W. L. Warskow.
Available from U.S. Soil Conservation Service, Courthouse, Spokane, WA. In: Proceedings of 45th Annual Meeting, Western Snow Conference, Albuquerque, New Mexico, April 18-21, 1977, p 95-101. 4 fig, 7 ref.

Descriptors: *Snow cover, *Mapping, *Arizona, *Aerial photography, *Satellites(Artificial), River basins, Water storage, Reservoirs, Snowmelt, Remote sensing, Analytical techniques, *Salt River, *Verde River.

The Salt River Project encompasses about 250,000 acres in central Arizona and provides municipal, industrial and agricultural water for a large majority of the Salt River Valley's 1.2 million residents. About 76 percent (1966-1975 average) of the Project's total annual water demand of 1,277,000 acre feet comes from its multi-purpose reservoir system. The remaining 24 percent of its total demand is produced by 255 deepwell pumps. The reservoir system is comprised of six dams having a total water storage capacity of 2,072,000 acre feet. Four of the six dams are located on the Salt River and two on the Verde River. About 75 percent of the mean annual runoff (1913-74) from the Salt and Verde Rivers originates from winter cyclonic and frontal storms during the December-May runoff season. Much of the precipitation from these storms falls as snow. Snow deposited above 7,000 feet elevation normally remains until the spring snowmelt period of March, April and May. However, about 90 percent of the total 13,000 square miles watershed lies below 7,000 feet elevation. Snow that falls on this area is ephemeral in nature and subject to very rapid melt. Because of the large areal extent of this portion of the watershed and the instability of its snowpack, very high runoff volumes have been experienced in relatively short periods of time, creating major flooding. Three satellite systems are being used to provide timely information for evaluating Salt-Verde watershed conditions. These systems, the Landsat, ITOS and SMS/GOES satellites are being evaluated under the NASA funded Applications Systems Verification Test (ASVT) on Snowcover Mapping. A brief description of each satellite system is presented with a discussion of satellite image interpretation techniques. (Woodard-USGS)

EXISTING STATE AND LOCAL WETLAND SURVEYS (1965-1975). VOLUME II: NARRATIVE,
Martel Labs., Inc., Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-278 427, Price codes: A20 in paper copy, A01 in microfiche. Prepared for Fish and Wildlife Service, Washington, D.C., Office of Biological Services, May 1976. 454 p, 119 ref, 4 append.

Descriptors: *Wetlands, *Surveys, *Legislation, Census, Data collections, Land use, Marsh management.

In preparation for a National Wetland Inventory, recent existing wetland surveys were identified. This report summarizes inventories performed in each State, and includes the reasons for the inventory, the methods used, the products prepared and key persons to contact for more information. A synopsis is provided of State Legislation that pertains to the management, protection, or identification of wetlands. (Steiner-Mass)

INNOVATIONS SIMPLIFY SHALLOW WELL MONITORING,
National Water Well Association, Worthington, OH.
R. Gronowski.
Water Well Journal, Vol. 33, No. 6, p 57, July, 1979.

Descriptors: *Groundwater, *Water quality, *Monitoring, *Shallow wells, Water sampling, Instrumentation, On-site data collections, Propane, Pumps, Plastic pipes.

Conventional methods of monitoring ground water quality are complex, time-consuming and expensive. An innovative device for ground water sampling, developed in Canada, allows variable depth monitoring through the installation of a single length of pipe. This multilevel device consist of a bundle of polypropylene tubes within a polyvinyl chloride (PVC) pipe which permits sampling at various levels. Before water samples can be taken, the tubes must be flushed by rapid pumping. Cost of materials for a 12 meter sampler with 20 sampling points is approximately $60. Another sampling device recently developed by Johnson Div., UOP, can be used in wells with diameters as small as one inch. Pumping is accomplished through the use of a 14-once propane cylinder connected to dual-conductor plastic tubing. Propane injected down one side of the tubing forces water to rise up the other side to ground surface. The Johnson sampler is portable, easy to operate and inexpensive. These innovations will make ground water quality monitoring in shallow wells more economical and efficient. (Purdin-NWWA)

INVESTIGATION OF THE ORION RESEARCH AMMONIA MONITOR,
Environmental Monitoring and Support Lab., Cincinnati, OH. Instrumentation Development Branch.
R. J. O'Herron.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 648, Price codes: A03 in paper copy, A01 in microfiche. Report EPA-600/4-77-028, 1977. 32 p, 12 fig, 9 tab, 14 ref.

Descriptors: *Instrumentation, *Analytical techniques, *Ammonia, *Performance, *Monitoring,

Laboratory test, On-site investigations, Waste water treatment, Sewage treatment.

The Orion Research ammonia monitor was investigated for its intended applications using Orion specifications and environmental considerations as a guide. Laboratory tests under controlled environmental conditions indicated that the electronic stability (drift) was well within + or - 10% of reading over the temperature range 5 to 42C. Sensor stability was tested by applying ammonia nitrogen in standard solutions of 10 mg/liter, 50 mg/liter, and 100 mg/liter as directed input to the monitor. Automatic standardization maintained readings within Orion's specified tolerance of + or - 10% of reading. On-stream measurements were made of a secondary sewage treatment plant effluent. These measurements were compared with those made with the standard method of distillation and titration. 65% of the comparisons were within 10% of reading. Steady-state comparisons made of field-collected samples with distillation-titration indicated that a 5% ammonia loss resulted from the straining and filtering of the sample input to the monitor. Eight of the nine samples compared were within 10% of the standard method. (Small-FRC)

ROLE OF U.S. GEOLOGICAL SURVEY IN ILLINOIS,
Geological Survey, Champaign, IL. Water Resources Div.
L. A. Martens.
In: Illinois Water Resources in a Changing Environment; Proceedings of Fifth Illinois Water Resources Conference, Chicago, Illinois, June 10-11, 1977: American Water Resources Association, Illinois Section, p 48, 1977.

Descriptors: *Illinois, *Projects, *Data collections, *Available water, *Water quality, Surface waters, Streamflow, Hydrologic data, Groundwater, Management, Cost sharing, Cooperatives, *U.S. Geological Survey.

The U.S. Geological Survey (USGS), in Illinois, conducts hydrologic research, collects water resources data, and provides technical assistance to Federal, State, and local agencies. Since the 1920's, the USGS water resources program has been aided materially by financial and technical cooperation with the State and local agencies, usually on a 50-50 basis, and by transfer of funds from other Federal Agencies operating in the water resources field. The USGS determines the source, quantity, quality, distribution, movement, and availability of both surface and ground water. These data are published and disseminated for the benefit of all data users, whether at the national, State, local, or individual level. (Woodard-USGS)

WATER RESOURCES OF THE WACCASASSA RIVER BASIN AND ADJACENT AREAS, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
G. F. Taylor, and L. J. Snell.
Geological Survey Water-Resources Investigations 77-101 (open-file report), 1978. 1 sheet, 7 fig, 3 tab, 6 ref.

Descriptors: *Maps, *River basins, *Available water, *Water quality, *Florida, Surface waters, Groundwater resources, Surface-groundwater relationships, Rainfall-runoff relationships, Topography, Streamflow, Water wells, Aquifers, Water utilization, Water resources development, Land use, *Waccasassa River basin.

This map report was prepared in cooperation with the Southwest Florida Water Management District which, with the Waccasassa River Basin Board, had jurisdiction over waters within the Waccasassa River basin, the coastal areas adjacent to the basin, and other adjacent areas outside the basin. New water management district boundaries, effective January 1977, place most of the Waccasassa River basin in the Suwannee River Water Management District. The purpose of the report is to provide water information for consideration in land-use and water development which is accelerating, especially in the northeastern part of the study area. It is based largely on existing data in the relatively undeveloped area. Of the total area included in the topographic drainage basin for the Waccasassa River about 72 percent is in Levy County, 18 percent in Alachua County, 9 percent in Gilchrist County, and 1 percent in Marion County. The elongated north-south drainage basin is approximately 50 mi in length, averages 13 mi in width, and lies between the Suwannee River, the St. Johns River, and the Withlacoochee River basins. (Woodard-USGS)

WATBUG: A FORTRAN IV ALGORITHM FOR CALCULATING THE CLIMATIC WATER BUDGET,
Delaware Univ., Newark. Water Resources Center.
C. J. Willmott.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 763, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Center, Delaware University, Contribution No. 23, Report No. 1, and Publications in Climatology, Vol. XXX, No. 2, 1977. 58 p, 2 fig, 1 tab, 12 ref, 3 append. OWRT A-040-DEL(1).

Descriptors: *Computer programs, *Hydrologic budget, *Algorithms, Evapotranspiration, Water balance, Mathematics, Data storage and retrieval, Data transmission, Data collections, Soil moisture, Precipitation(Atmospheric), Air temperature, Moisture availability, Moisture deficit.

The computer program described is designed for use in a variety of problems, and requires a minimum amount of input information. Every effort was made to make the code transparent, so that it could be easily modified should additional or alternative computations be desired. Currently the program uses the Thornthwaite (1948) method for calculating potential evapotranspiration; the subroutines where the estimates are made may be replaced by another method. The advantages of WATBUG over most previously published water budget programs include: (1) budgets can be computed on a monthly or daily basis; (2) records of monthly budgets up to 40 years and daily budgets up to one year can be repeated to 'balance the budget'; (3) all relationships are explicitly specified so that 'look-up' tables are not required; (4) the program is easily modified; and (5) multiple budgets may be done in a single run. The program requires that periods of time evaluated as a single budget be consecutive. A variety of multi-annual monthly and daily data sets were used to test all WATBUG's options. Hand computations made for comparison with the results of each test run were in agreement within a mm or two. These slight differences occur because intermediate values are rounded to whole numbers at each step in hand calculations and rounding errors may accumulate. In WATBUG, rounding to the nearest whole mm takee after the budget terms have been calculated just prior to their being written on paper. (Davison-IPA)

WATER RESOURCES OF THE KODIAK-SHELIKOF SUBREGION, SOUTH-CENTRAL ALASKA,
Geological Survey, Anchorage, AK. Water Resources Div.
S. H. Jones, R. J. Madison, and C. Zenone.
Available from Branch of Distribution, USGS 1200 S. Eads St. Arlington VA 22202 price $3.50. Geological Survey Hydrologic Investigations Atlas HA-612, 1978. 2 sheets, 22 ref.

Descriptors: *Maps, *Water resources, *Surface waters, *Groundwater, *Water quality, Hydrogeology, Aquifer characteristics, Water wells, Water levels, Hydrologic data, Precipitation(Atmospheric), Runoff, Streamflow, Specific conductivity, Water temperature, Alaska, *Kodiak-Shelikof subregion.

Hydrologic data for the Kodiak-Shelikof subregion of south-central Alaska are summarized to provide a basis for planning water resources development, identifying water problems and evaluating existing

water quality and availability. Average annual precipitation, measured at a few coastal locations in this maritime climatic zone, ranges from 23 to 127 inches. Mean annual runoff for the Kodiak Island group ranges from 4 to 8 cfs/sq mi. A maximum instantaneous runoff of 457 cfs/sq mi has been determined from a small basin on Kodiak Island. Lowest measured stream discharges range from no flow to 0.91 cfs/sq mi. Surface water is the primary source of water supplies for the city of Kodiak and other communities. The geology of the subregion is characterized by metamorphosed sedimentary and volcanic rocks with only a thin mantle of unconsolidated material. A few small, alluvium-filled coastal valleys offer the most favorable conditions for ground-water development, but moderate yields (50-100 gal/min) have been obtained from wells in fractured bedrock. Water in streams and lakes generally has a dissolved-solids concentration less than 60 mg/L, and the water varies from a calcium-bicarbonate type to a sodium-chloride type. The chemical composition of ground waters has a dilute calcium-bicarbonate type in unconsolidated materials and a sodium-bicarbonate type in bedrock. The dissolved solids in the groundwater ranges from 170 to 250 mg/L. (Woodard-USGS)

THE CITRONELLE AQUIFERS IN MISSISSIPPI,
Geological Survey, Jackson, MS. Water Resources Div.
E. H. Boswell.
Geological Survey Water-Resources Investigations 78-131 (open-file report), 1979. 1 sheet, 4 fig, 1 tab, 19 ref.

Descriptors: *Groundwater resources, *Mississippi, *Aquifer characteristics, *Water quality, *Water levels, Maps, Water wells, Water yield, Hydrogeology, Water analysis, Chemical analysis, Water utilization, *Citronelle Formation, Miocene aquifers, Pliocene aquifers.

The Citronelle aquifers consist of sand and gravel of Pliocene age that forms a discontinuous outcrop area of about 6,000 square miles in southern Mississippi. The beds dip to the south at an average rate of about 6 feet per mile. The unconfined aquifers are used mostly for domestic and farm use but also supply water to several municipalities and industries. The average saturated thickness of the aquifers is about 45 feet. This physically limits drawdown space and, although specific capacities are high, yields generally do not exceed a few hundred gallons per minute. Water levels have not declined significantly because withdrawals are small. Water quality is generally good although in some places there are objectionally high concentrations iron and in some the water is acidic.
W79-07940

WATER FOR MUNICIPAL AND INDUSTRIAL DEVELOPMENT IN HINDS, MADISON, AND RANKIN COUNTIES, MISSISSIPPI,
Geological Survey, Jackson, MS. Water Resources Div.
C. A. Spiers, and G. J. Dalsin.
Mississippi Research and Development Center, 1979. 78 p, 31 fig, 10 tab, 43 ref.

Descriptors: *Mississippi, *Water resources, *Surface waters, *Groundwater resources, *Water quality, Water utilization, Hydrologic data, Water supply, Streamflow, Gaging stations, Low flow, Flood frequency, Aquifer characteristics, Water wells, Water yield, Water levels, Chemical analysis, Maps, Industrial water, Municipal water, *Hinds County(Miss), *Madison County(Miss), *Rankin County(Miss).

Hinds, Madison, and Rankin Counties occupy an area of 2,428 square miles in southwest-central Mississippi. Water use for the area during 1976 was 51 million gallons per day of which 25 million gallons per day were obtained from ground-water sources. However, the largest water user in the area, the city of Jackson, obtains most of its water from the Pearl River. Surface-water resources include the Pearl and Big Black Rivers and the Ross Barnett Reservoir. The average runoff contributed by the area to the various rivers is 1,990 million gallons per day. The chemical and physical quality of water in streams of the area is generally suitable for most uses. The principal aquifers are the Meridian-upper Wilcox aquifer, Sparta Sand, the Cockfield Formation, the Forest Hill Sand, and the Catahoula Sandstone. From Jackson southwestward the base of freshwater generally occurs at the base of the Sparta Sand. The report concludes a series of 16 multicounty water-resources investigations in Mississippi. (Woodard-USGS)
W79-07944

HYDROLOGY OF THE BEAVER VALLEY AREA, BEAVER COUNTY, UTAH, WITH EMPHASIS ON GROUND WATER,
Geological Survey, Salt Lake City, UT. Water Resources Div.
R. W. Mower.
Utah Department of Natural Resources Technical Publication 63, 1978. 90 p, 18 fig, 3 plates, 17 tab, 64 ref.

Descriptors: *Hydrologic data, *Surface waters, *Groundwater, *Available water, *Water quality, Runoff, Maps, Hydrogeology, Aquifer characteristics, Water wells, Well data, Water yields, Water levels, Groundwater recharge, Consumptive use, Water supply, Irrigation wells, Groundwater movement, Model studies, Chemical analysis, *Beaver County(Utah).

Beaver Valley, which includes 534 square miles in southwestern Utah, is in the Basin and Range physiographic province. The water needs of the valley are supplied mainly by four streams rising in the Tushar Mountains, which had a mean annual inflow of 56,020 acre-feet during 1966-74, and by withdrawals from wells during the same period, which averaged 5,080 acre-feet. The total amount of water in storage in the principal ground-water reservoir in the spring of 1974 was 12 million acre-feet. The dissolved-solids concentration of water from streams, springs, and wells in most parts of the valley is less than 500 milligrams per liter. Generally, the best quality surface and ground water is at the eastern side of the valley, and the poorest quality water is at the lower southwestern part. (Woodard-USGS)

SINGLE-VALVE PROTOTYPE TESTS, MAIN LOCK, LOCKS AND DAM 26, MISSISSIPPI RIVER, ALTON, ILLINOIS,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
D. E. Hart.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A06 1174, Price codes: A03 in paper copy, A01 in microfiche. Miscellaneous Paper H-78-10, September 1978. 29 p, 3 tab, 2 photos, 6 pl.

Descriptors: *Locks, *Valves, *Prototype tests, *Lock and Dam No. 26, Mississippi River.

Prototype tests were conducted to determine the fastest permissible single-valve lock chamber filling (and emptying) that could be tolerated without exceeding the generally accepted maximum load per hawser of 5 tons. A number of filling valve openings were used while hawser loads and other phenomena were measured. As a result, initial filling valve opening of 3.4 ft (20 sec) was recommended. No restrictions on the emptying valve opening were found to be necessary. (WES).

WATER QUALITY CONTROL AND BLOOMINGTON LAKE,
Corps of Engineers, Baltimore, MD. Baltimore District.
F. B. Juhle.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 114-118, 5 fig, 7 ref. Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2.

Descriptors: *Water quality control, *Dam sites, *Artificial lakes, *Earth dams, Impoundments, Flood control, River basin development, Mine drainage, Acid mine water, Alkalinity, Acidity, Acid streams, Engineering structures, Mathematical models, Stratification, Lakes, North Branch Potomac River(Maryland), Savage River(Maryland), Bloomington Lake(Maryland), Spillways.

The Bloomington Lake project, authorized by the Flood Control Act of October 1962, will be operated as a two-lake system to provide flood control, water supply, water quality, and recreational benefits. The Bloomington dam, currently under construction, will have an intake tower to control the emergency spillway flow into the outlet tunnel. The highly acid water of the North Branch Potomac River will affect the water quality of the lake which is estimated to range between pH 3.7 and pH 4.2 with an associated net alkalinity of -40 to -15 mg/l. Presently the river quality fluctuates, and during low flow periods a 2.7 pH with an associated net alkalinity of -180 mg/l has been measured. The function of the selective withdrawal intake tower is described and illustrated by schematic drawings. Mathematical modeling techniques were applied to determine lake stratification regarding temperature and acid quality, and to determine water withdrawal from the ports on the intake tower. Both models were linked and run simultaneously at various elevations to determine the optimum number and configuration of the ports. Regulation of Bloomington Lake will be geared to maintaining the best possible long-term water quality in the river downstream of the Savage River confluence. It will be necessary to maintain a constantly updated inventory of the acid stored in the lake and monitor the water quality at each level in the lake. An alkalinity inventory and quality profile will be kept for Savage River Lake, because Savage River is mildly alkaline. The water quality downstream should become constant when the system commences. (Davison-IPA)

8B. Hydraulics

AN ESTIMATE OF CHANNEL ROUGHNESS OF INTEROCEANIC CANALS,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
G. H. Keulegan.
Available from the National Technical Information

Service, Springfield, VA 22161 as AD-A058 706, Price codes: A03 in paper copy, A01 in microfiche. Technical Report H-78-13, July 1978. 124 p, 39 fig, 23 tab, 40 ref.

Descriptors: *Canal construction, *Canals, *Roughness(Hydraulic), *Interoceanic canals.

The hydraulic roughness of the interoceanic canals created by either nuclear or conventional construction is considered. In the canals of nuclear excavation, the part of resistance due to the ejecta is estimated on the basis of distribution of size of ejecta material; and the part due to the expansions and contractions in the canal created by the explosives is attributed to the isostatic losses from free turbulence. For the conventional canals charged with very fine sediment, the friction of the granular surfaces is assumed to be that in a hydrodynamically smooth surface. In the presence of bed features, the added form resistance is estimated from the findings of Alam and Kennedy concerning alluvial rivers. A detailed study of resistance noted in Fort Collins tests shows that there is a difference in the frictional processes between the laboratory flumes and the natural rivers, suggesting that for resistance estimates reliance should be placed on river calibration. (WES)

SIDE WEIR IN RECTANGULAR CHANNEL,
Roorkee Univ. (India). Dept. of Civil Engineering.
K. G. Ranga Raju, B. Prasad, and S. K. Gupta.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Proceedings Paper 14596, p 547-554, May 1979. 6 fig, 1 tab, 8 ref, 2 append.

Descriptors: *Weirs, *Subcritical flow, *Laboratory tests, *Hydraulic models, Data processing, Irrigation, Sewers, Channels, Flow, Energy, Hydraulics, Side weirs, Broad-crested weirs, Sharp-crested weirs.

The discharge characteristics of a side weir at the head of a branch channel taking off at right angles to the main channel were investigated. Both sharp-crested and broad-crested weirs were studied for the case of subcritical flow in the main channel. A procedure of design based on De Marchi's theory was evolved. The De Marchi coefficient is empirically related to the Froude number at the upstream end of the weir, and the ratio of the upstream depth (above the weir crest) is related to the length of the weir. (Sims-ISWS)
W79-07534

TWO-DIMENSIONAL FLOW FIELD OF MULTIPORT DIFFUSER,
Georgia Inst. of Tech., Atlanta. Dept. of Civil Engineering.
P. J. W. Roberts.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Technical Note, p 607-611, May 1979. 3 fig, 5 ref, 1 append.

Descriptors: *Outfall sewers, *Flow characteristics, *Hydraulic structures, *Diffusion, Oceans, Hydraulics, Outlets, Shallow water, Analytical techniques, Laboratory tests, Jets, Flow, Dimensional analysis, Distribution patterns, Multiport diffuser, Plumes, Buoyant jets.

The two-dimensional flow field in the center of a long, multiport ocean sewage outfall diffuser was considered. The gross properties of the flow are predicted by simple dimensional arguments, assuming that the diffuser is approximated by a line source of buoyancy flux only, i.e., a pure plume. The results of two-dimensional experiments were presented. For fairly small times, the thickness of the surface layer is constant and independent of the source buoyancy flux. The surface layer occupies about 30% of the water depth, and advances, due to a balance of pressure and inertia forces, at a constant speed. For long times, the spreading of the surface layer is governed by a balance of pressure and interfacial shear forces. The thickness of the wastefield then grows slowly with time, and the length grows as the 4/5 power of time. Comparison of the results with those of the initial spreading phase of larger scale experiments on model multiport sewage outfall diffusers showed close agreement. (Humphreys-ISWS)

L.N. FAN'S DATA ON BUOYANT JETS IN CROSSFLOW,
McGill Univ. (Montreal). Dept. of Civil Engineering and Applied Mechanics.
V. H. Chu.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 105, No. HY5, Technical Note, p 612-617, May 1979. 4 fig, 7 ref, 1 append.

Descriptors: *Jets, *Flow characteristics, *Diffusion, Hydraulics, Laboratory tests, Open channel flow, Analytical technique, Analysis, Spatial distribution, Discharge(Water), Buoyant jets, Crossflow.

The experimental data by F.L. Fan on buoyant jet in a crossflow was successfully correlated and presented in a rather simple manner in this paper, using a set of dimensionless variables suggested by a line impulse model. There have been other more sophisticated analytical models developed in recent years, but the advantage of the simple model lies in the fact that experimental results can be correlated by simple formulas which can be used readily by practicing engineers. It also provides a better basis for further study on related problems with more complex initial conditions. It is important to point out that in the limiting case when the crossflow is very small, the simple formulas presented in this paper are not applicable in the region close to the exit. Wright has recently proposed a method to deal with the problem in such a limiting case. (See also W69-08423 and W77-09013) (Humphreys-ISWS)

WATER TEMPERATURE EFFECTS ON HORIZONTAL BUOYANT SUBMERGED JETS,
West Virginia Univ., Morgantown. Dept. of Mechanical Engineering and Mechanics.
J. B. Riester, R. A. Bajura, and S. H. Schwartz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 293, Price codes: A08 in paper copy, A01 in microfiche. Research Report No. 4, September 1977. 144 p, 59 fig, 1 tab, 23 ref, 3 append. OWRT C-7171 (No. 6214) (1), 14-34-0001-6214.

Descriptors: *Pumped storage, Hydraulic models, Turbulence, Mixing, Froude number, Tailrace, Reservoirs, *Stratification, Reynolds number, Jets, Reservoir operation, Buoyancy.

Experimental and analytical studies were performed on submerged buoyant fresh water and salt water jets ejected horizontally into calm ambient water. The behavior of fresh water jets was found to be dependent upon the jet and ambient water temperatures as well as the Froude number and Reynolds number. As the ambient temperature was lowered, the jets penetrated to a greater horizontal. The jet width, centerline velocity, and centerline temperature also changed with ambient temperature. The jet trajectory was also shown to change with jet temperature. The trajectory of salt water jets was found to change with salt concentration in the jet. As salt concentration was lowered, the jets penetrated to a greater horizontal distance for the same Froude number. Results are presented for various ambient and jet temperatures, and concentration levels for salt water jets. The results may be used in predicting trajectories, velocities, temperatures, and widths of fresh water jets, and trajectories of salt water jets. The nozzle geometry was shown experimentally to have a small effect on the jet trajectory. The turbulent mixing in fresh water jets was found to be independent of Reynolds number above a Reynolds number of 1550. The results of the nozzle geometry and Reynolds number studies are useful in formulating model studies.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 298, Price codes: A07 in paper copy, A01 in microfiche. Research Report No. 5, October 1977. 115 p, 34 fig, 4 tab, 19 ref, 3 append. OWRT C-7171 (No. 6214) (2), 14-34-0001-6214.

Descriptors: *Pumped storage, Hydraulic models, Turbulence, Mixing, Froude number, Tailrace, Reservoirs, *Stratification, Reynolds number, Jets, Reservoir operation, Buoyancy.

The objectives were to determine the factors which affect the degree of thermal mixing that occurs when two rectangular tanks exchange water in a cyclical manner. The experiment tests were conducted with two types of initial conditions - (1) both tanks initially at a uniformly mixed temperature, and, (2) a two layer stratification profile in one tank with the thermocline located at the jet outlet. The independent test parameters were represented in nondimensional form by the Froude number, the Fourier number, and the number of cycles of operation. A stratification parameter, S, based on the center of gravity of the buoyancy of the water in the tank, was developed. For each of the initial conditions tested, a general correlation for the stratification parameter as a function of the dimensionless parameters was found. The functional relationship was based on the assumption that the amount of mixing that occurs within the tank is proportional to the volume of fluid entrained by the jet and the initial Froude number of the test. If the fluid is injected into a uniformly mixed tank, the stratification in the tank will be increased and then eventually decrease to the uniformly mixed state. A fluid jet injected at the thermocline of a strongly stratified tank will cause the stratification in the tank to decrease and eventually approach the uniformly mixed state. The destratification rate of a tank was found to be a function of the Froude number, the Fourier number, and the number of cycles of operation.

A NUMERICAL SIMULATION FOR A PUMPED STORAGE RESERVOIR,
West Virginia Univ., Morgantown. Dept. of Mechanical Engineering and Mechanics.
J. D. Faber, R. A. Bajura, and S. H. Schwartz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 290, Price codes: A08 in paper copy, A01 in microfiche. Research Report No. 7, October 1977. 153 p, 83 fig, 4 tab, 15 ref, 4 append. OWRT C-7171 (No. 6214) (3), 14-34-0001-6214.

Descriptors: *Pumped storage, Hydraulic models, Turbulence, Mixing, Froude number, Tailrace, Reservoirs, *Stratification, Reynolds number, Jets, *Reservoir operation, Buoyancy, Numerical analysis.

A computer program was developed to numerically simulate the velocity and temperature fields in an idealized two-dimensional pumped storage reservoir. The reservoir model includes a submerged inlet and a rising upper boundary to simulate rising water surfaces due to inflow. The solution is obtained by solving the energy, vorticity, and stream function equations using various finite differencing techniques. The eddy viscosity and eddy conduc-

tivity terms in the equations were considered constant. The nodal spacing and the time step used were found to be the major parameters affecting stability. Results were obtained for a series of test cases with different percentages of the initial volume added. Cases were run for 0% of the initial volume added (or a constant surface level), for 15% added, and for 30% added. For each percentage of volume increase, Froude numbers of 3.16, 10, and 21.6 were run. The results are in qualitative agreement with experimental predictions for flow fields.
W79-07574

EFFECT OF VERTICAL SCALE DISTORTION ON THE TEMPERATURE FIELD OF A THERMAL-HYDRAULIC MODEL,
West Virginia Univ., Morgantown. Dept. of Mechanical Engineering and Mechanics.
D. P. Michelotti, R. A. Bajura, and S. H. Schwartz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 274, Price codes: A07 in paper copy, A01 in microfiche. Research Report No. 9, October 1978. 115 p, 34 fig, 12 tab, 11 ref, 2 append. OWRT C-7171 (No. 6214) (4), 14-34-0001-6214.

Descriptors: *Pumped storage, Hydraulic models, Turbulence, Mixing, Froude number, Tailrace, Reservoirs, *Stratification, Reynolds number, Jets, Reservoir operation, Buoyancy.

The objectives were to determine the effects of a vertical scale distortion on the flow and temperature fields of a hydraulic model of a pumped storage reservoir system. The study considered vertical to horizontal scale ratios of 1:1, 3:1, and 5:1. The model consisted of a submerged hot water jet discharging into an initially cold isothermal reservoir. The jet discharge geometry was patterned after what was considered to be a typical pumped storage outlet. Results are presented for various jet Froude numbers. Thermal mixing was demonstrated to be a function of the jet Froude number and the model distortion factor. A stratification parameter and an energy distribution parameter were developed to describe the characteristics of the reservoir in terms of the vertical temperature distribution. Temperature data for each experiment were correlated as a function of the Froude number, the distortion factor and the stratification and energy distribution parameters. Reservoir stratification was found to decrease as the jet Froude number is increased. It was also found that less thermal stratification occurred as the model distortion factor is increased.

PUMPED STORAGE SURVEY,
West Virginia Univ., Morgantown. Dept. of Mechanical Engineering and Mechanics.
J. B. Riester, S. H. Schwartz, and R. A. Bajura.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-297 329, Price codes: A03 in paper copy, A01 in microfiche. Research Report No. 3, September 1976. 43 p, 31 fig, 3 append. OWRT C-7171 (6214) (6), 14-34-0001-6214.

Descriptors: *Pumped storage, Hydraulic models, Turbulence, Mixing, Froude number, Tailrace, Reservoirs, *Stratification, Reynolds number, Jets, Reservoir operation, Buoyancy, Hydraulic structures.

This report presents a summary of data obtained from a survey sent to over 50 power companies concerning the operation and planning of pumped storage hydroelectric generating stations. The data were organized into the three categories of power output, geometric characteristics of sites, and operational considerations. Much of the data are presented in the form of histograms to summarize the statistical results into subcategories of interest. The information contained in this survey will be used to aid in the process of selecting reservoir models for study under the West Virginia University Pumped Storage Model Study program.

8C. Hydraulic Machinery

BIT MAINTENANCE,
Ingersoll-Rand Co., Phillipsburg, NJ.
G. Doyle.
Water Well Journal, Vol. 33, No. 6, p 47-49, June, 1979.

Descriptors: *Drilling equipment, *Maintenance, *Drill bits, Drilling, Rocks, Abrasion drill bits, Air-percussion drilling.

Tungsten carbide button bits are used effectively for percussion drilling in medium and hard rock formations. They are not self-sharpening and need periodic maintenance to maximize bit life and penetration rates. The bits are designed for efficient rock breakage and hole cleaning if used properly. Several rules for efficient percussion drilling are given. Frequency of bit reconditioning depends on drilling conditions. In hard-abrasive rock, a flat spot on a button should be immediately ground to a spherical shape. In soft or hard non-abrasive formations the buttons should be ground before reaching 10% expected bit life, even if no flat spots are visible. Bit maintenance also requires grinding the air blowholes and chip clearance grooves, greasing the threaded joint, and checking the body, splines, and striking end. Grinding requires a vitrified silicone carbide wheel one to two inches in diameter and an inch wide, rated at 24,000 rpm or more. (Purdin-NWWA)

GROUND WATER HEAT PUMP UPDATE,
National Water Well Association, Wothington, OH.
D. Bacon.
Water Well Journal, Vol. 33, No. 6, p 44, June, 1979.

Descriptors: *Heat pumps, *Research and development, Laboratory tests, Projects, Heating, Coaling, Efficiencies, Discharge(Water), Groundwater.

Examples of residential developments incorporating ground water geothermal heat pumps are given. The heat pump's high operating efficiency gives these homes a distinct marketing advantage over homes with conventional heating and cooling systems. The Department of Energy has contracted with the National Water Well Association to investigate the hydrologic characteristics, costs, and environmental and legal aspects of heat pump use. George Smith, Inc. has begun a project to evaluate the efficiency of ground water geothermal heat pumps under controlled laboratory conditions. (Purdin-NWWA)
W79-07640

HACKMATACK MADE RELIABLE HAND PUMPS,
Canadian Water Well, Vol. 5, No. 2, p 6, May, 1979.

Descriptors: *Pumps, *Hand pumps, *Appropriate technology, *Lumber, Conifer trees, Fabrication, Water wells.

The technique of fabricating wooden hand pumps is described in detail. It involves boring one or more logs to be used as casing. Many types of wood can be used, but the best is from a conifer called Hackmatack. A lathe is used to shape the spout and plunger. After turning, the plunger is cut to form a flexible joint with the plunger rod and the valve and pump leather are attached. The pump leather makes a seal between the plunger and cylinder walls. The valve, also of leather, is taked to the top side of the plunger to provide a seal when the plunger is raised (thus causing the vacuum which raises the water), and opening on the downward stroke to fill the upper casing with water. These pumps are capable of drawing water from 20 feet below the surface. (Purdin-NWWA)

WATER SYSTEM BASICS - TROUBLESHOOTING FOR JET PUMPS,
Ground Water Age, Vol. 13, No. 9, p 13-15, 50, May, 1979. 5 tab.

Descriptors: *Jet pumps, *Pump testing, Charts, Maintenance, Repairing.

Troubleshooting charts for jet pump installation are presented in an easy to follow format. Five major problems are covered in five separate charts. These are: (1) the pump doesn't start or keep running; (2) the motor overheats and overload trips out; (3) the pump starts and stops too often; (4) the pump operates but delivers little or no water; and (5) the pump doesn't shut off. Several causes of each problem are listed along with techniques for checking and testing and procedures for correcting the problem once the cause has been determined. The charts are arranged in sequence so that the easiest checks are made first. In only a few cases is it necessary to pull the piping ejector or foot valve from the well. Most of the work can be done at the surface. (Purdin-NWWA)

LINER MATERIALS EXPOSED TO HAZARDOUS AND TOXIC SLUDGES,
Matrecon, Inc., Oakland, CA.
H. E. Haxo, R. S. Haxo, and R. M. White.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 013, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-77-081, 1977. 62 p, 16 fig, 16 tab, 59 ref, 3 append.

Descriptors: *Linings, *Chemical wastes, *Waste disposal, *Durability, *Elastomers, Polymers, Oily water, Acids, Alkalis, Plastics, Pesticides, Oil wastes, Membranes, Concretes, Cements, Engineering structures, Waste water disposal, Industrial wastes, Sludge disposal.

The effectiveness and durability of various liner materials were examined for the interception and control of leachate from hazardous and solid wastes disposal sites. The materials evaluated as possible liners included: a native soil, modified bentonite, a soil cement, a hydraulic asphalt concrete, an asphaltic membrane, and 8 polymeric membranes based on polyvinyl chloride, chlorinated polyethylene, chlorosulfonated polyethylene, ethylene propylene rubber, neoprene, butyl rubber, an elasticized polyolefin, and a thermoplastic polyester elastomer. The potential liner materials were exposed to the hazardous wastes, a strong acid, a strong base, oil refinery tank bottom waste, a combination of lead wastes from gasoline production, saturated and unsaturated hydrocarbon oil waste, and a pesticide. Preliminary results of the study indicated that some of the liner materials were not compatible with certain wastes and several combinations were eliminated, such as asphalt materials with oily wastes. Oily wastes were not compatible with noncrystalline polymeric membranes. Strong acids, bases, and concentrated brines adversely affected bentonite liners, polymer modified bentonite, and some soils. Aqueous wastes containing oily

phases posed the problem of the liners simultaneously resisting two components which were inherently different in their compatibility with materials. (Lisk-FRC)

RESEARCH OF THE U. S. FISH AND WILDLIFE SERVICE,
Fish and Wildlife Service, Washington, DC. Div. of Population Ecology Research.
J. A. McCann.
In: The Freshwater Potomac, Aquatic Communities and Environmental Stresses, Proceedings of a Symposium, January 1977, College Park, Maryland, Flynn, K. C. and Mason, W. T., Eds., 1978. p 97-101. Interstate Commission on the Potomac River Basin, Rockville, Md. Technical Publication 78-2.

Descriptors: *Laboratories, *Research and development, *Wildlife, *Fish conservation, Pesticide toxicity, Fish reproduction, Fish conservation, Fish diets, Spawning, Fish behavior, Limnology, Fish diseases, Aquatic habitats, Aquatic environment, Toxins.

The activities of some of the fishery-oriented laboratories within the U. S. Fish and Wildlife Service which may be of particular interest to the Potomac basin are discussed. Work at the Fish Pesticide Research Laboratory, Columbia, Missouri, is concentrated on toxicological appraisal of the short- and long-term effects of pesticides and phthalate esters on reproduction, growth, and survival of fish and other aquatic organisms. The internationally known Patuxent Wildlife Research Center, Laurel, Maryland, conducts studies on contaminants in the Potomac River-Chesapeake Bay system focusing on critical problems of endangered species and migratory birds. The ecology of the Great Lakes is evaluated at the Great Lakes Fishery Laboratory, Ann Arbor, Michigan, where research on resource assessment, population ecology, fish psychology, and limnology is conducted. Research on restoration of the Atlantic salmon to its historic spawning grounds is carried out at the University of Maine, Orono. At the Eastern Fish Disease Laboratory, Leetown, West Virginia, studies of the diseases of sport and commercial fish are conducted. Cooperative Fishery Research Units, established at 25 major universities throughout the country, conduct coordinated cooperative research, and provide fishery resources related advance training programs. During the past decade fisheries Federal aid program has funded $67 million for fisheries and environmental research and general studies. (Davison-IPA)

10A. Acquisition And Processing

THE NATIONAL WATER DATA STORAGE AND RETRIEVAL SYSTEM (WATSTORE) OF THE U.S. GEOLOGICAL SURVEY,
Geological Survey, Reston, VA. Water Resources Div.
C. R. Showen.
Paper presented at First NAWDEX Membership Conference, Denver, Colorado, May 9-11, 1978. 7 p, 1 fig.

Descriptors: *Data storage and retrieval, *Computers, *Information exchange, *Hydrologic data, *Data processing, Automation, Information retrieval, *National Water Data Storage and Retrieval System(WATSTORE).

As a part of the Geological Survey's program of releasing water data to the public, a large-scale computerized system, the National Water Data Storage and Retrieval System (WATSTORE) was developed. The WATSTORE system provides for the processing, storage, and retrieval of water data pertaining to surface water, quality of water, and ground water. At present (1978), there are 60 Geological Survey remote job entry sites, located in various offices throughout the country, that are equipped with high-speed computer terminals for remote access to the system. There are 36 terminals located in other Federal agencies and 13 terminals located in non-Federal governmental agencies that have access to the system. The primary use of the system by these agencies is to retrieve raw data for further analyses or to use the Geological Survey data files and computer programs to provide standard analytical results. BIBLIOGRAPHIC SOURCES OF COMPUTER PROGRAMS AND NUMERICAL MODELS IN HYDRAULICS,
Geological Survey, Reston, VA. Water Resources Div.
C. Lai.
American Society of Civil Engineers, Hydraulics Division, Task Committee on Computational Hydraulics, August 1978. 13 p, 9 ref.

Descriptors: *Bibliographies, *Computer programs, *Mathematical models, *Hydraulics, *Indexing, Hydrology, Surface waters, Groundwater, Thermal water, Estuaries, Documentation.

In the fall of 1977, the Hydraulics Division of the American Society of Civil Engineers organized a new committee called 'Task Committee on Computational Hydraulics'. As one of its duties, the Committee at its first official meeting, held at the National Center of the U.S. Geological Survey on October 28, 1977, looked into the availability of mathematical, numerical and computer models for general use by hydraulic engineers. Many organizations and individuals have responded to the calls of the Task Committee to compile a list of bibliographies on computer programs and numerical models in hydraulics. This list has been prepared largely based on such responses and contributions. Part I contains sources that are in a form of formal publication and can be quoted by a proper reference or identification. Part II is composed of ad hoc lists prepared for the request of the Task Committee or informal lists, each of which may have previously been made for various purposes. Several small lists, each containing only a few programs or models, are catalogued in Part III. In addition to those contained in Parts I, II, and III, there were some which the editor was unable to classify or include in the above three parts. These are placed in Part IV. (Woodard-USGS)

W79-07628 5C

APATITE
Distribution and Fractionation of Arsenic in Selected Fresh Water Lake Sediments,
W79-07689 5A

APPALACHIAN MOUNTAIN REGION
An Investigation into the Effect of Storm Type on Precipitation in a Small Mountain Watershed,
W79-07767 2B

APPALACHIAN MOUNTAIN REGION (MARYLAND)
Fishes of the Appalachian Region of Maryland,
W79-07970 5C

APPLICATION METHODS
On-Land Disposal of Municipal Sewage Sludge: A Guide to Project Development (Interim Report),
W79-07780 5E

Policy on Municipal Sludges,
W79-07826 5F

Utilization of Municipal Sludge in Agriculture,
W79-07840 5E

APPROPRIATE TECHNOLOGY
Hackmatack Made Reliable Hand Pumps,
W79-07723 8C

APPROPRIATION
Colorado Ground Water Up for Grabs.
W79-07631 6E

AQUATIC ANIMALS
An Empirical Transport Model for Evaluating Entrainment of Aquatic Organisms by Power Plants,
W79-07515 7B

Effects of Suspended Dredged Material on Aquatic Animals,
W79-07523 5E

Benthic Macroinvertebrates of the Freshwater Potomac,
W79-07966 5C

AQUATIC BACTERIA
Microbiological Studies,
W79-07963 5A

AQUATIC ENVIRONMENT
Aquatic Disposal Field Investigations Ashtabula River Disposal Site, Ohio, Appendix C, Investigation of Water-Quality and Sediment Parameters,
W79-07525 5C

Toxic Materials in the Aquatic Environment,
W79-07962 6G

Fishery Resources and Management in West Virginia,
W79-07969 2A

Fishery Resources of the Shenandoah Valley,
W79-07971 5C

The Effects of Thermal Effluents and Sediments on the Insect Fauna,
W79-07980 5C

AQUATIC HABITATS
Monitoring Spawning Gravel in Managed Forested Watersheds, A Proposed Procedure,
W79-07503 5C

Fishery Resources and Management in West Virginia,
W79-07969 2A

Fishery Resources of the Shenandoah Valley,
W79-07971 5C

The Effects of Thermal Effluents and Sediments on the Insect Fauna,
W79-07980 5C

Impact of Wastewater Treatment Plant Discharges,
W79-07985 5C

AQUATIC INSECTS
The Effects of Thermal Effluents and Sediments on the Insect Fauna,
W79-07980 5C

AQUATIC INVERTEBRATES
Biomonitoring of Pulp and Paper Effluents,
W79-07983 5A

AQUATIC LIFE
Fishery Resources of the Shenandoah Valley,
W79-07971 5C

Protecting Aquatic Life: What Can the Layman Do,
W79-07992 6E

AQUATIC MICROBIOLOGY
Distribution of Phytoplankton in Florida Lakes,
W79-07771 5C

AQUATIC POPULATIONS
Toxic Substances in Opequon Creek, Virginia,
W79-07975 5B

AQUEOUS SOLUTIONS
Destroying Chemical Wastes in Commercial Scale Incinerators. Facility Report Number 3 - Systems Technology,
W79-07871 5D

Destroying Chemical Wastes in Commercial Scale Incinerators. Facility Report Number 1 - The Marquardt Company,
W79-07872 5D

AQUICLUDES
Connector Well Experiment to Recharge the Floridan Aquifer, East Orange County, Florida,
W79-07705 4B

AQUIFER CHARACTERISTICS
Map Showing General Availability of Ground Water in the Kaiparowits Coal-Basin Area, Utah,
W79-07938 4B

The Citronelle Aquifers in Mississippi,
W79-07940 7C

Mathematical Modelling of a Well Field, Chatham, N. B.,
W79-07961 2F

AQUIFERS
Groundwater Contour Mapping in Venice by Stochastic Interpolators, 1. Theory,
W79-07559 2F

Groundwater Contour Mapping in Venice by Stochastic Interpolators, 2. Results,
W79-07560 2F

Map of Antelope Valley-East Kern Water Agency Area, California, Showing Ground-Water Subunits and Areas, Location of Wells, and Lines of Equal Depth to Water for Spring, 1978,
W79-07701 7C

Connector Well Experiment to Recharge the Floridan Aquifer, East Orange County, Florida,
W79-07705 4B

Impact of the Law Regulating Drinking Water on Water Resources Management,
W79-07716 6E

Jordan Aquifer of Iowa,
W79-07769 2F

Ground-Water Data for Michigan, 1977,
W79-07947 2F

Records of Ground-Water Recharge and Discharge for the Edwards Aquifer in the San Antonio Area, Texas, 1934-77,
W79-07949 2F

ARCHILOA
Adaptations to Sulfide in the Meiofauna of the Sulfide System. I. 35S-Sulfide Accumulation and the Presence of a Sulfide Detoxification System,
W79-07652 5B

ARIZONA
The Application of Aerial and Satellite Snow-Mapping Techniques for Multi-Purpose Reservoir System Operations in Arizona,
W79-07695 7B

Current Groundwater Law in Arizona,
W79-07909 6E

AROCLORS
Comparison of the Effects of Fourteen-Day and Chronic Exposures to a Polychlorinated Biphenyl, Aroclor 1242, on Molting of the Fiddler Crab, Uca Pugilator,
W79-07662 5C

AROMATIC COMPOUNDS
An Intensive Study of the Heavy Hydrocarbons in the Suspended Particulate Matter of Seawater,
W79-07922 5B

Fate of Petroleum-Derived Aromatic Compounds in Seawater Held in Outdoor Tanks,
W79-07923 5C

ARSENIC
Distribution and Fractionation of Arsenic in Selected Fresh Water Lake Sediments,
W79-07689 5A

ARSENIC COMPOUNDS
Arsenic in Streams, Stream Sediments, and Ground Water, Fairbanks Area, Alaska,
W79-07563 5B

Arsenic Contamination of Ground Water in the Maritimes,
W79-07960 5A

ARTHROBACTER
Experimental Degradation of Crude Oil by Marine Bacteria,
W79-07594 5B

ARTIFICIAL LAKES
Water Quality Control and Bloomington Lake,
W79-07979 8A

ARTIFICIAL PRECIPITATION
Project Skywater: Fiscal Years 1975-78 Report.
W79-07514 3B

ARTIFICIAL RECHARGE
Connector Well Experiment to Recharge the Floridan Aquifer, East Orange County, Florida,
W79-07705 4B

Use of Storm-Water Basins for Artificial Recharge with Reclaimed Water, Nassau County, Long Island, New York--A Hydraulic Feasibility Study,
W79-07948 4B

Changes in Vegetation Diversity Caused by Artificial Recharge,
W79-07951 4B

ASELLUS
The Effects of Hydrogen Cyanide on Asellus Communis and Gammarus Pseudolimnaeus and Changes in their Competitive Response when Exposed Simultaneously,
W79-07612 5C

ASHTABULA RIVER
Aquatic Disposal Field Investigations Ashtabula River Disposal Site, Ohio, Appendix C, Investigation of Water-Quality and Sediment Parameters,
W79-07525 5C

ASSESSMENT
Volume III. The Wetlands/Edges Program. Research on the Chesapeake Bay to Provide a Knowledge Base for Physical Alterations of the Edges of the Chesapeake Bay,
W79-07724 6G

ASSESSMENTS
Natural Resources of Coastal Wetlands in Northern Santa Barbara County,
W79-07728 2L

Manual for the Control of Hazardous Material Spills. Volume One. Spill Assessment and Water Treatment Techniques,
W79-07868 5B

ATLANTIC SALMON
Toxicity of Permethrin, Decamethrin, and Related Pyrethroids to Salmon and Lobster,
W79-07654 5C

ATOMIC ABSORPTION SPECTROMETER
Automated Determination of Tin in Water,
W79-07950 5A

ATTITUDES
Protecting Aquatic Life: What Can the Layman Do,
W79-07992 6E

AUSTRALIA
Collie River Underflow into the Wellington Reservoir,
W79-07552 2E

Effects of Channel Enlargement by River Ice Processes on Bankfull Discharge in Alberta, Canada,
W79-07756 2E

AVAILABLE WATER
A Geohydrologic Overview for the Pecora Symposium Field Trip, June 1979,
W79-07699 2A

Energy Development Scenarios and Water Demands and Supplies--An Overview,
W79-07700 6B

Report of the River Master of the Delaware River for the Period December 1, 1976 -- November 30, 1977,
W79-07702 6D

Role of U.S. Geological Survey in Illinois,
W79-07711 7C

Water Resources of the Waccasassa River Basin and Adjacent Areas, Florida,
W79-07712 7C

Hydrology of the Beaver Valley Area, Beaver County, Utah, with Emphasis on Ground Water,
W79-07945 7C

BACTERIA
Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume IV - Appendices G - I,
W79-07928 5C

BARNACLES
Some Ecological Effects of the Venpet - Venoil Collision,
W79-07684 5C

BASE FLOW
Use of Specific Conductance and Contact Time Relations for Separating Flow Components in Storm Runoff,
W79-07764 2B

BASELINE STUDIES
Federal Role in OCS Oil and Gas Development.
W79-07931 5C

BASIC DATA COLLECTIONS
Geothermal Environmental Impact Assessment: Baseline Data for Four Geothermal Areas in the United States,
W79-07504 2F

BASINS
The Hydrological Response of Headwater and Sideslope Areas,
W79-07755 2E

BEAVER COUNTY (UTAH)
Hydrology of the Beaver Valley Area, Beaver County, Utah, with Emphasis on Ground Water,
W79-07945 7C

BED LOAD
Compartmented Sediment Trap,
W79-07538 2J

BELFAST LOUGH (IRELAND)
Zinc and Copper Levels in Belfast Lough,
W79-07657 5C

BENTHIC FAUNA
The Effects of an Experimental Spillage of Oil Sands Tailings Sludge on Benthic Invertebrates,
W79-07665 5C

Benthic Macroinvertebrates of the Freshwater Potomac,
W79-07966 5C

BENTHOS
Bureau of Land Management South Texas Outer Continental Shelf Report of Consultancy on Benthic Ecology Programme - 22 August - 11 September and 24 October - 5 November,
W79-07918 5C

Macroinvertebrate Study,
W79-07919 5C

Biomass Measurements of Benthic Invertebrates,
W79-07920 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume IV - Appendices G - I,
W79-07928 5C

Benthic Macroinvertebrates of the Shenandoah Basin,
W79-07967 5C

BIBLIOGRAPHIES
Bibliographic Sources of Computer Programs and Numerical Models in Hydraulics,

The Reproduction Behavior of Gammarus Duebeni (Lilljeborg), and the Inhibitory Effect of a Surface Active Agent,
W79-07672 5C

Chemosensory Induced Bradycardia in the Kelp Crab, Pugettia Producta (Randall),
W79-07673 5C

Detection of Naphthalene by the Blue Crab, Callinectes Sapidus,
W79-07676 5A

CHEMOTAXIS
Resistance of Bacterial Chemotaxis to Blockage in Petroleum Waters,
W79-07641 5C

CHESAPEAKE BAY
Volume III. The Wetlands/Edges Program. Research on the Chesapeake Bay to Provide a Knowledge Base for Physical Alterations of the Edges of the Chesapeake Bay,
W79-07724 6G

CHLORAMINE
The Effect of Temperature on the Toxicity of Chlorinated Cooling Waters to Marine Animals-A Preliminary Review,
W79-07639 5C

CHLORDANE
Bioconcentration of Chlordane by the Green Alga Scenedesmus Quadricauda,
W79-07625 5C

PCBs and Organochlorine Insecticides in Oysters from Coastal Lagoons of the Gulf of Mexico, Mexico,
W79-07630 5C

Acute Toxicity of Dechlorinated DDT, Chlordane and Lindane to Bluegill (Lepomis Macrochirus) and Daphnia Magna,
W79-07671 5C

In Vivo Effect on ATPase in Certain Tissues of Labeo Rohita and Saccobranchus Fossilis, Following Chronic Chlordane Intoxication,
W79-07674 5C

CHLORELLA
Bacterial Suppression of Chlorella by Hydroxylamine Production,
W79-07589 5C

Methylamine Uptake in the Green Alga Chlorella Pyrenoidosa,
W79-07613 5C

Nitrogen and Phosphorus Removal from Sewage Effluent with High Salinity by Chorella Salina,
W79-07643 5D

CHLORINATED HYDROCARBON
Uptake from Seawater and Clearance of p,p'-DDT by Marine Planktonic Crustacea,
W79-07690 5C

CHLORINATED HYDROCARBON PESTICIDES
Toxicity and Bioaccumulation of Hexachlorocylopentadiene Hexachloronorbornadiene and Heptachloronorbornene in Larval and Early Juvenile Fathead Minnows, Pimephales Promelas,
W79-07622 5C

Bioconcentration of Chlordane by the Green Alga Scenedesmus Quadricauda,
W79-07625 5C

CHLORINATED HYDROCARBONS
Transport, Distribution and Toxic Effects of Polychlorinated Biphenyls in Ecosystems: Review,
W79-07688 5C

CHLORINATION
Effect of Intermittent Chlorination on Developing Zebrafish Embryos (Brachydanio Rerio),
W79-07627 5C

Shipboard Evaluation of a Carlson Mark 10 Chlorinator/Macerator Sanitary Waste-Water Treatment System,
W79-07801 5D

CHLORINE
Effect of Intermittent Chlorination on Developing Zebrafish Embryos (Brachydanio Rerio),
W79-07627 5C

The Effect of Temperature on the Toxicity of Chlorinated Cooling Waters to Marine Animals-A Preliminary Review,
W79-07639 5C

Evaluating Disinfection Alternatives,
W79-07848 5D

CHLOROPHENOLS
Relation between Toxicity and Accumulation of Various Chlorophenols in Goldfish,
W79-07614 5B

CHROMIUM
Survival of Euglena Gracilis Exposed to Sublethal Temperature and Hexavalent Chromium,
W79-07770 5C

CHROMOBACTERIUM
Experimental Degradation of Crude Oil by Marine Bacteria,
W79-07594 5B

CHRYSOPHRYS
Availabilities of Three Iron Compounds as Dietary Iron Sources for Red Sea Bream,
W79-07602 5C

Requirement of Red Sea Bream for Dietary Mg,
W79-07615 5C

CICHLIDS
Studies on Intraperitoneal Toxicity of Lead to Cichlasoma Nigrofasciatum (Guenther) Development,
W79-07617 5C

Embryotoxicity and Hatchability in Cichlasoma Nigrofasciatum (Guenther) Eggs and Larvae Briefly Exposed to Low Concentrations of Zinc and Copper Ions,
W79-07668 5C

CIRRHINA
Organophosphate Poisoning to Some Fresh Water Teleosts - Acetylcholinesterase Inhibition,
W79-07626 5C

CITRONELLE FORMATION
The Citronelle Aquifers in Mississippi,
W79-07940 7C

CLAMS
Review of Oxygen Depletion and Associated Mass Mortalities of Shellfish in the Middle Atlantic Bight in 1976,
W79-07596 5C

The Effect of Temperature on Growth, Physiology, and Gametogenesis in the Manila Clam Tapes Philippinarum (Adams & Reeve, 1850),
W79-07650 5C

The Distribution of Heavy Metals in the Hard Clam, Mercenaria Mercenaria, in the Lower Chesapeake Bay Region,
W79-07685 5B

Cadmium Sorption in Estuarine Mud-Type Sediment and the Accumulation of Cadmium in the Soft-Shell Clam, Mya Arenaria,
W79-07691 5C

CLIMATOLOGY
Annual Precipitation in the Northeast United States: Long Memory, Short Memory, or No Memory,
W79-07555 2B

CLOSED CONDUITS
Analysis of Closed Conduit Irrigation System and Its Subdivision,
W79-08000 6A

CLOUD SEEDING
Project Skywater: Fiscal Years 1975-78 Report.
W79-07514 3B

COAGULATION
Inorganic Suspended Sludge Dewatering,
W79-07834 5E

COAL MINE WASTES
Coal Mine Water Pollution - Legal and Regulatory Issues: A Survey,
W79-07887 5B

The Rising Costs of Mine Drainage Abatement,
W79-07977 5D

COASTAL MARSHES
Natural Resources of Coastal Wetlands in Northern Santa Barbara County,

Saving the Coast: The British Experience,
W79-07899 6E

CONSUMPTIVE USE
Reductions in Water Consumption and Flow of Sewage - Report to Congress.
W79-07785 5F

CONTAINMENT AREAS
Assessment of Low-Ground-Pressure Equipment for Use in Containment Area Operation and Maintenance,
W79-07520 5E

CONTAMINANT TRANSPORT
Determination of Hydrologic Parameters for Glacial Tills in Connecticut,
W79-07715 2F

CONTINENTAL SHELF
Expanded Offshore Leasing and the Mandates of Nepa,
W79-07898 5B

Recent Congressional Action on Outer Continental Shelf Oil and Gas Development,
W79-07906 6E

CONTINUOUS MODELS
Reducing the Cost of Continuous Hydrologic-Hydraulic Simulation,
W79-07998 2A

CONTROL SYSTEMS
Digital Controller for Trickle Irrigation,
W79-07935 3F

Electronic Timers for Automated Surface Irrigation Systems,
W79-07989 3F

CONVECTION
Effects of a Barrier on Temperature Structure and Mixing in Thermally Stratified Water Cooled from Above,
W79-07584 2A

Free Convection in Thermally Stratified Water Cooled from Above,
W79-07585 2A

COOLING
Effects of a Barrier on Temperature Structure and Mixing in Thermally Stratified Water Cooled from Above,
W79-07584 2A

Free Convection in Thermally Stratified Water Cooled from Above,
W79-07585 2A

COOLING WATER
Assessment in Industrial Hazardous Waste Management Petroleum Re-Refining Industry,
W79-07781 5E

COPEPODS
Calanoid Copepod Eggs in Sea-Bottom Muds. IV. Effects of Some Environmental Factors on the Hatching of Resting Eggs,
W79-07642 5B

Some Effects of Sub-Lethal Concentrations of Copper on a Marine Copepod,
W79-07647 5C

COPPER
Vessel-Related Contamination of Southern California Harbours by Copper and Other Metals,
W79-07628 5C

Some Effects of Sub-Lethal Concentrations of Copper on a Marine Copepod,
W79-07647 5C

Zinc and Copper Levels in Belfast Lough,
W79-07657 5C

Embryotoxicity and Hatchability in Cichlasoma Nigrofasciatum (Guenther) Eggs and Larvae Briefly Exposed to Low Concentrations of Zinc and Copper Ions,
W79-07668 5C

Schema of Lethal Action of Copper on Mussels,
W79-07670 5C

The Distribution of Heavy Metals in the Hard Clam, Mercenaria Mercenaria, in the Lower Chesapeake Bay Region,
W79-07685 5B

The Distribution of Trace Metals in the Wilderness Lakes,
W79-07994 5A

COPPER COMPOUNDS
Cyanide Removal from Petroleum Refinery Waste Water Using Powdered Activated Carbon,
W79-07806 5D

CORDGRASS
Growth Dynamics of Cordgrass, Spartina Alterniflora, Loisel., on Control and Sewage Sludge Fertilized Plots in a Georgia Salt Marsh,
W79-07681 5C

CORES
The Distribution of Trace Metals in the Wilderness Lakes,
W79-07994 5A

CORN
Irrigated Corn Yield Response to Water,
W79-07793 2I

CORYNEBACTERIUM
Experimental Degradation of Crude Oil by Marine Bacteria,
W79-07594 5B

COST ANALYSIS
First Order Estimates of Energy Requirements for Pollution Control,
W79-07798 6B

Cost Analysis of Water and Waste Water Treatment Processes in Developing Countries,
W79-07999 6B

COST MINIMIZATION
Analysis of Closed Conduit Irrigation System and Its Subdivision,
W79-08000 6A

COSTS
Cost of Landspreading and Hauling Sludge from Municipal Wastewater Treatment Plants. Case Studies,
W79-07777 5E

Combined Storm Overflow Treatment with SALA-HGMF High Gradient Magnetic Filters,
W79-07819 5D

Thickening of Sludges,
W79-07838 5D

Solid Liquid Separation Utilizing an Inclined Plate Separator and Filter Press,
W79-07852 5D

The Rising Costs of Mine Drainage Abatement,
W79-07977 5D

CRABS
Comparison of the Effects of Fourteen-Day and Chronic Exposures to a Polychlorinated Biphenyl, Aroclor 1242, on Molting of the Fiddler Crab, Uca Pugilator,
W79-07662 5C

Chemosensory Induced Bradycardia in the Kelp Crab, Pugettia Producta (Randall),
W79-07673 5C

Detection of Naphthalene by the Blue Crab, Callinectes Sapidus,
W79-07676 5A

Kepone: Toxicity and Bioaccumulation in Blue Crabs,
W79-07679 5C

CRASSOSTREA
PCBs and Organochlorine Insecticides in Oysters from Coastal Lagoons of the Gulf of Mexico, Mexico,
W79-07630 5C

CREOSOTE
Hydrogeological Control and Clean-Up of Soil and Groundwater Contaminants at Northern Wood Preserves, Ltd,
W79-07860 5D

CRUDE OIL
Effects of Temperature on the Median Tolerance Limit of Pink Salmon and Shrimp Exposed to Toluene, Naphthalene, and Cook Inlet Crude Oil,
W79-07637 5C

The Effects of an Experimental Spillage of Oil Sands Tailings Sludge on Benthic Invertebrates,
W79-07665 5C

Induction of Benzo (a) Pyrene Monooxygenase in Fish and the Salmonella Test as a Tool for Detecting Mutagenic/Carcinogenic Xenobiotics in the Aquatic Environment,
W79-07669 5C

Some Ecological Effects of the Venpet - Venoil Collision,
W79-07684 5C

Addendum to Histopathology of Demersal Fishes. Histopathology of Micropogon Undulatus (Atlantic Croaker) Exposed to Water Soluble Fractions of South Louisiana Crude Oil,
W79-07921 5C

CRYSTALLIZATION
Closed Loop System for the Treatment of Waste Pickle Liquor,
W79-07783 5D

CULVERTS
Optimal Design of Culverts under Uncertainties,
W79-07549 2E

YANIDE
Lethal and Sublethal Effects of Binary Mixtures of Cyanide and Hexavalent Chromium, Zinc, or Ammonia to the Fathead Minnow (Pimephales Promelas) and Rainbow Trout (Salmo Gairdneri),
W79-07610 5C

YANOPHYTA
Application of a New Bioassay to Screen the Toxicity of Polychlorinated Biphenyls on Blue-Green Algae,
W79-07658 5A

YCLING NUTRIENTS
Nutrient Dynamics of Freshwater Riverine Marshes and the Role of Emergent Macrophytes,
W79-07734 2K

Nutrient Relationships in the Detritus of a Tropical Swamp,
W79-07736 2K

YCLODIENE INSECTICIDES
Toxicity and Bioaccumulation of Hexachlorocylopentadiene Hexachloronorbornadiene and Heptachloronorbornene in Larval and Early Juvenile Fathead Minnows, Pimephales Promelas,
W79-07622 5C

YPRINIDS
Chemical Contamination by PCBs in the Fishes of a French River: The Furans (Jura),
W79-07618 5C

AM SITES
Water Quality Control and Bloomington Lake,
W79-07979 8A

AMAGES
Assessment of Civil Monetary Penalties for Water Pollution: A Proposal for Shifting the Burden of Proof Regarding Damages,
W79-07907 6E

APHNIA
Correlations between Daphnia Magna and Fathead Minnow (Pimephales Promelas) Chronic Toxicity Values for Several Classes of Test Substances,
W79-07603 5A

Cadmium Toxicity of Laboratory and Field Populations of Daphnia Galeata Mendotae,
W79-07616 5C

Oxygen Consumption in Daphnia Pulex Exposed to 2,4-D or 2,4,5-T,
W79-07666 5C

Acute Toxicity of Dechlorinated DDT, Chlordane and Lindane to Bluegill (Lepomis Macrochirus) and Daphnia Magna,
W79-07671 5C

ATA COLLECTIONS
Water in the West,
W79-07696 6B

Plans for Water Data Acquisition by Federal Agencies Through Fiscal Year 1980,

DRILL BITS
Bit Maintenance,
W79-07509 8C

DRILLING EQUIPMENT
Bit Maintenance,
W79-07509 8C

DRILLING LOGS
A Computer Program for Well Logs,
W79-07758 7C

DRINKING WATER SUPPLIES
Impact of the Law Regulating Drinking Water on Water Resources Management,
W79-07716 6E

DRYING
Sludge Incineration Systems for Purification and Resource Recovery,
W79-07827 5E

Thermal Drying of Dewatered Sewage Sludge,
W79-07836 5E

DURABILITY
Liner Materials Exposed to Hazardous and Toxic Sludges,
W79-07779 8G

E COLI
Resistance of Bacterial Chemotaxis to Blockage in Petroleum Waters,
W79-07641 5C

EARTH DAMS
Water Quality Control and Bloomington Lake,
W79-07979 8A

EARTH-WATER INTERFACES
Permeable Wall Effects on Poiseuille Flow,
W79-07749 2E

ECDYSIS
Comparison of the Effects of Fourteen-Day and Chronic Exposures to a Polychlorinated Biphenyl, Aroclor 1242, on Molting of the Fiddler Crab, Uca Pugilator,
W79-07662 5C

ECOLOGY
Natural Resources of Coastal Wetlands in Northern Santa Barbara County,
W79-07728 2L

Water Way Preservation: The Wild and Scenic Rivers Act of 1968,
W79-07895 6E

Determination of Average Dry Weights of Important Neuston Species Collected in 1976,
W79-07917 5C

Bureau of Land Management South Texas Outer Continental Shelf Report of Consultancy on Benthic Ecology Programme - 22 August - 11 September and 24 October - 5 November,
W79-07918 5C

Macroinvertebrate Study,
W79-07919 5C

ECONOMIC EFFICIENCY
Optimum Alternatives for Controlling Combined Sewage Overflows--A Case Study,
W79-07997 6B

ECONOMIC IMPACT
Overcoming Legal and Institutional Barriers to Planned Reuse of Water in the Colorado River Basin,
W79-07502 6E

Guidance Economic Analysis for the Concrete Products Industries.
W79-07803 6B

ECONOMICS
Assessment of Civil Monetary Penalties for Water Pollution: A Proposal for Shifting the Burden of Proof Regarding Damages,
W79-07907 6E

ECOSYSTEMS
Evaluating Pollution Stress on Ecosystems,
W79-07516 5A

Opportunities for Maintenance Rehabilitation of Riparian Habitats: Eastern United States,
W79-07518 5C

ECOTYPES
Changes in Vegetation Diversity Caused by Artificial Recharge,
W79-07951 4B

EDWARDS AQUIFER
Records of Ground-Water Recharge and Discharge for the Edwards Aquifer in the San Antonio Area, Texas, 1934-77,
W79-07949 2F

EELS
Pseudodactylogyrus Microrchis (Monogenea) on the Gills of Cultured Eels-III Experimental Control by Trichlorfon,
W79-07593 5C

EFFECTS
Optimum Alternatives for Controlling Combined Sewage Overflows--A Case Study,
W79-07997 6B

EFFLUENT STREAMS
Washington State Refineries: Petroleum, Petroleum Derivatives and Wastewater Effluent Characteristics,
W79-07799 5B

Destroying Chemical Wastes in Commercial Scale Incinerators. Facility Report Number 1 - The Marquardt Company,
W79-07872 5D

EFFLUENTS
The Use of Evapotranspiration as a Means of Wastewater Disposal,
W79-07772 5D

The Economic Impact of Alternative Cyanide Standards in Illinois,
W79-07885 6E

Effluent Toxicity Testing,
W79-07974 5A

EGYPT
Mercury Pollution of Mediterranean Sediments Around Alexandria, Egypt,
W79-07656 5C

ELASTOMERS
Liner Materials Exposed to Hazardous and Toxic Sludges,
W79-07779 8G

ELECTRIC CURRENTS
Inorganic Suspended Sludge Dewatering,
W79-07834 5E

ELECTRIC POWER PRODUCTION
Larval Fish Distribution in Southwestern Lake Erie Near the Monroe Power Plant,
W79-07519 5C

EMBRYOGENESIS
The Chronic Toxicity of Carbaryl and Lindane to the Freshwater Mollusc Lymnea Stagnalis L. (Toxicite Chronique du Carbaryl et du Lindane Chez le Mollusque d'eau Lymnea Stagnalis L),
W79-07624 5C

EMBRYONIC GROWTH STAGE
Effect of Intermittent Chlorination on Developing Zebrafish Embryos (Brachydanio Rerio),
W79-07627 5C

ENDOSULFAN
PCBs and Organochlorine Insecticides in Oysters from Coastal Lagoons of the Gulf of Mexico, Mexico,
W79-07630 5C

ENERGY
Energy Development Scenarios and Water Demands and Supplies--An Overview,
W79-07700 6B

Water Law Problems of Solar Hydrogen Production,
W79-07901 6E

ENERGY CONVERSION
Water Law Problems of Solar Hydrogen Production,
W79-07901 6E

The Microfouling Problem and the Future of the Ocean Thermal Energy Conversion (OTEC) Program,
W79-07933 5C

ENERGY DEVELOPMENT
Energy Development Scenarios and Water Demands and Supplies--An Overview,
W79-07700 6B

ENGINEERING
Northern Groundwater and Engineering Problems Related to Groundwater Flow,
W79-07956 2F

ENGLAND
Effects of Channel Enlargement by River Ice Processes on Bankfull Discharge in Alberta, Canada,
W79-07756 2E

ENTERIC BACTERIA
Effect of Upgrading a Municipal Wastewater Effluent on Pollution Indicator and other Microorganisms in River Water,
W79-07633 5C

ENTEROMORPHA
Metal Contents of the Two Marine Algae Found on Iron Ore Tailings,
W79-07609 5B

ENTRAINMENT
An Empirical Transport Model for Evaluating Entrainment of Aquatic Organisms by Power Plants,
W79-07515 7B

Larval Fish Distribution in Southwestern Lake Erie Near the Monroe Power Plant,
W79-07519 5C

ENVIRONMENT
Effects of Thermal Discharge on Aquatic Insects in the Tennessee Valley,
W79-07505 5C

Environmental Disturbance and Life Histories: Principles and Examples,
W79-07636 5C

ENVIRONMENTAL CONTROL
Conservation Districts and 208 Water Quality Management-Nonpoint Source Identification and Assessment, Selection of Best Management Practices, Management Agencies, Regulatory Programs,
W79-07886 4A

ENVIRONMENTAL EFFECTS
Influence of a Barite Tailings Pond Rupture on the Fishes of Big River, Missouri,
W79-07507 5C

Inertia and Elasticity as a Stream Classification System: Youghiogheny River Case History Evaluation,
W79-07508 5C

An Empirical Transport Model for Evaluating Entrainment of Aquatic Organisms by Power Plants,
W79-07515 7B

Evaluating Pollution Stress on Ecosystems,
W79-07516 5A

Future Research Needs,
W79-07517 6A

Reservoirs and Waterways; Identification and Assessment of Environmental Quality Problems and Research Program Development,
W79-07522 5G

Environmental Disturbance and Life Histories: Principles and Examples,
W79-07636 5C

Transport, Distribution and Toxic Effects of Polychlorinated Biphenyls in Ecosystems: Review,
W79-07688 5C

The Economic Impact of Alternative Cyanide Standards in Illinois,
W79-07885 6E

Study Design for Resource Management Decisions: OCS Oil and Gas Development and the Environment.
W79-07932 5C

Benthic Macroinvertebrates of the Shenandoah Basin,
W79-07967 5C

Effects of Thermal Discharges on Freshwater Fishes,
W79-07982 5C

Impact of Wastewater Treatment Plant Discharges,
W79-07985 5C

ENZYMES
Effect of Methamidophos on the Growth Rate and Esterase Activity of the Common Carp Cyprinus Carpio L.
W79-07607 5C

Organophosphate Poisoning to Some Fresh Water Teleosts - Acetylcholinesterase Inhibition,
W79-07626 5C

Induction of Benzo (a) Pyrene Monooxygenase in Fish and the Salmonella Test as a Tool for Detecting Mutagenic/Carcinogenic Xenobiotics in the Aquatic Environment,
W79-07669 5C

In Vivo Effect on ATPase in Certain Tissues of Labeo Rohita and Saccobranchus Fossilis, Following Chronic Chlordane Intoxication,
W79-07674 5C

EQUATIONS
Universal Constants for Scaling the Exponential Soil Water Diffusivity,
W79-07754 2G

Aerobic Stabilization of Activated Sludge,
W79-07837 5E

The Dependence of Dewatering Process on Aqueous Properties of Sludges,
W79-07841 1A

EQUIPMENT
Assessment of Low-Ground-Pressure Equipment for Use in Containment Area Operation and Maintenance,
W79-07520 5E

EROSION CONTROL
Controlling Sediment Damage,
W79-07990 4D

ESTIMATED BENEFITS
Analysis of Economic Effects of Water Surface Elevations on U.S. Shoreline of Lake Champlain, New York and Vermont,
W79-07744 6B

ESTUARIES
Estuaries,
W79-07722 2L

EUGLENA
Survival of Euglena Gracilis Exposed to Sublethal Temperature and Hexavalent Chromium,
W79-07770 5C

EUTROPHICATION
Inertia and Elasticity as a Stream Classification System: Youghiogheny River Case History Evaluation,
W79-07508 5C

Evaluating Pollution Stress on Ecosystems,
W79-07516 5A

Distribution of Phytoplankton in Florida Lakes,
W79-07771 5C

EVALUATION
An Index of Refractory Organics,
W79-07784 5A

Pyrolysis Applications for Industrial and Municipal Treatment,
W79-07812 5D

Physical, Chemical, and Biological Treatment Techniques for Industrial Wastes. Volume 1,
W79-07873 5D

Nutrient Modeling,
W79-07988 5B

EVAPORATION
Wind Profile Parameters and Turbulence Intensity over Several Roughness Element Geometries,
W79-07547 2D

EVAPOTRANSPIRATION
Evapotranspiration Computed to Estimate Leaching Fractions,
W79-07546 2D

An Advection-Aridity Approach to Estimate Actual Regional Evapotranspiration,
W79-07548 2D

The Use of Evapotranspiration as a Means of Wastewater Disposal,
W79-07772 5D

Potential Evaporation--Significance and Measurement,
W79-07955 2D

EXETER (UNITED KINGDOM)
Identification of Suspended Sediment Sources by Means of Magnetic Measurements: Some Preliminary Results,
W79-07533 5B

EXPERIMENTAL FARMS
Conference on Muskegon County, Michigan Wastewater System, September 17-18, 1975, A Critical Review on Evaluations of the System and Identification of Needed Research,
W79-07864 5D

Review of System Design Parameters,
W79-07865 5D

Performance and Economics of the System,
W79-07866 5D

EXPLOSIVES
Compatibility of Flocculating Agents with RDX/TNT/Comp B,
W79-07787 5D

FEASIBILITY
Feasibility Study of Waste Water Recovery in Shrimp Processing Plants,
W79-07794 5D

FEDERAL GOVERNMENT
Plans for Water Data Acquisition by Federal Agencies Through Fiscal Year 1980,
W79-07704 6B

Highlights of the Clean Water Act of 1977,
W79-07874 5D

Municipal and Industrial Water Conservation - The Federal Government Could Do More,
W79-07881 6E

Federal Enforcement Proceedings under the 1977 Clean Water Act,
W79-07910 6E

Federal Role in OCS Oil and Gas Development.
W79-07931 5C

FEDERAL JURISDICTION
A Revision of Existing Regulations of the National Pollutant Discharge Elimination System,
W79-07883 6E

Reserved Water Rights, Indian Rights and the Narrowing Scope of Federal Jurisdiction: The Colorado River Decision,
W79-07903 6E

FEDERAL RESERVATIONS
Federal Reserved Water Rights Since PLLRC,
W79-07875 6E

FEDERAL-STATE WATER RIGHTS CONFLICTS
Reserved Water Rights, Indian Rights and the Narrowing Scope of Federal Jurisdiction: The Colorado River Decision,
W79-07903 6E

Cappaert V. United States: A Dehydration of Private Groundwater Use,
W79-07904 6E

FEDERAL WATER POLLUTION CONTROL ACT
Guidance Economic Analysis for the Concrete Products Industries.
W79-07803 6B

Highlights of the Clean Water Act of 1977,
W79-07874 5D

Federal Water Pollution Control Act Construction Grants,
W79-07884 6E

FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS
Legal and Scientific Perspectives,
W79-07993 6E

FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972
Acid Mine Drainage and the Clean Water Act,
W79-07978 6E

FERNS
Testing the Environment for Dispersed Mutagens: Use of Plant Bioconcentrators Coupled with Microbial Mutagen Assays,
W79-07587 5A

Screening Aquatic Ecosystems for Mutagens with Fern Bioassays,
W79-07588 5A

FILTERS
York Region's Operational Experience with Tertiary Treatment,
W79-07844 5D

Solid Liquid Separation Utilizing an Inclined Plate Separator and Filter Press,
W79-07852 5D

FILTRATION
Residual Heavy Metal Removal by an Algae-Intermittent Sand Filtration System,
W79-07638 5C

Treatment and Stabilization of Polychlorinated Biphenyls (PCBs) Contaminated Water and Waste Oil-A Case Study. Whitehouse, Florida,
W79-07778 5D

Demonstration of Ultrafiltration and Carbon Adsorption for Treatment of Industrial Laundering Wastewater,
W79-07786 5D

A Method of Manure Disposal for Beef Packing Operation,
W79-07795 5D

Evaluation of Leachate Treatment Volume 2: Biological and Physical-Chemical Processes,
W79-07808 5D

USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, Held at Cincinnati, Ohio on April 5-6, 1977,
W79-07811 5D

Waste Water Treatment by Physical and Mechanical Methods,
W79-07813 5D

Current Status and Directions of Development of Physico-Mechanical Effluent Treatment in the Paper Industry,
W79-07816 5D

Employment of Microstrainers in the Waste Water Treatment Practice,
W79-07817 5D

The Control of Refinery Mechanical Waste Water Treatment Processes by Controlling the Zeta Potential,
W79-07818 5D

Combined Storm Overflow Treatment with SALA-HGMF High Gradient Magnetic Filters,
W79-07819 5D

Performance Tests on Full-Scale Tertiary Granular Media Filters,
W79-07821 5D

Thickening and Dewatering of Waste Water Sludges by Vibro Filtration Method,
W79-07832 5E

Development and Implementation of an Improved Waste Water Treatment System at Imperial's Sarina Refinery,
W79-07853 5D

Treatment and Recovery of Emulsified Oil by Ultrafiltration,
W79-07862 5D

FIN LESIONS
Elemental Distribution in Relation to Skin Necroses of Marine Flatfishes from the English Channel,
W79-07597 5C

FINITE ELEMENT ANALYSIS
A Finite-Element Model of Overland and Channel Flow for Assessing the Hydrologic Impact of Land-Use Change,
W79-07565 4D

FISH
Fishery Resources and Management in West Virginia,
W79-07969 2A

Toxic Substances in Opequon Creek, Virginia,
W79-07975 5B

FISH BEHAVIOR
Influence of a Barite Tailings Pond Rupture on the Fishes of Big River, Missouri,
W79-07507 5C

Modification of the Rheotropic Response of Rainbow Trout (Salmo Gairdneri) by Sublethal Doses of the Aquatic Herbicides Diquat and Simazine,
W79-07645 5C

FISH CONSERVATION
The Fishery of the Piedmont Potomac,
W79-07972 5C

Research of the U. S. Fish and Wildlife Service,
W79-07976 9C

FISH DIETS
Availabilities of Three Iron Compounds as Dietary Iron Sources for Red Sea Bream,
W79-07602 5C

Requirement of Red Sea Bream for Dietary Mg,
W79-07615 5C

FISH DISEASES
Elemental Distribution in Relation to Skin Necroses of Marine Flatfishes from the English Channel,
W79-07597 5C

FISH ESTABLISHMENT
The Zoogeography of the Freshwater Fishes of the Potomac River Basin,
W79-07968 2A

Fishery Resources and Management in West Virginia,
W79-07969 2A

Fishery Resources of the Shenandoah Valley,
W79-07971 5C

The Fishery of the Piedmont Potomac,
W79-07972 5C

FISH MANAGEMENT
The Fishery of the Piedmont Potomac,
W79-07972 5C

FISH MIGRATION
Drainage Evolution and Fish Dispersal in the Central Appalachians: Summary,
W79-07510 2E

Larval Fish Distribution in Southwestern Lake Erie Near the Monroe Power Plant,
W79-07519 5C

The Zoogeography of the Freshwater Fishes of the Potomac River Basin,
W79-07968 2A

FISH PARASITES
Elemental Distribution in Relation to Skin Necroses of Marine Flatfishes from the English Channel,
W79-07597 5C

FISH PHYSIOLOGY
The Effects of Hydrogen Cyanide on Asellus Communis and Gammarus Pseudolimnaeus and Changes in their Competitive Response when Exposed Simultaneously,
W79-07612 5C

The Effects of Temperature and Different Food Organisms on the Rate of Gastric Evacuation in Perch (Perca Fluviatilis),
W79-07683 5C

FISH POPULATIONS
Influence of a Barite Tailings Pond Rupture on the Fishes of Big River, Missouri,
W79-07507 5C

Larval Fish Distribution in Southwestern Lake Erie Near the Monroe Power Plant,
W79-07519 5C

Distribution of Chaetognaths Along the Salinity Gradient in the Cochin Backwater, an Estuary Connected to the Arabian Sea,
W79-07675 5C

The Zoogeography of the Freshwater Fishes of the Potomac River Basin,
W79-07968 2A

Fishery Resources and Management in West Virginia,
W79-07969 2A

Fishes of the Appalachian Region of Maryland,
W79-07970 5C

Fishery Resources of the Shenandoah Valley,
W79-07971 5C

The Fishery of the Piedmont Potomac,
W79-07972 5C

FISH REPRODUCTION
Lake Champlain Fisheries Investigation: United States Waters,
W79-07743 2I

FISHERIES
OCS Development and Commercial and Recreational Fishing,
W79-07934 5C

Fishery Resources of the Shenandoah Valley,
W79-07971 5C

The Fishery of the Piedmont Potomac,
W79-07972 5C

FISHES
Addendum to Histopathology of Demersal Fishes. Histopathology of Micropogon Undulatus (Atlantic Croaker) Exposed to Water Soluble Fractions of South Louisiana Crude Oil,
W79-07921 5C

FISHING
Fishery Resources and Management in West Virginia,
W79-07969 2A

FISHKILL
Hypothermal Mortality in Marine Fishes of South-Central Florida January, 1977,
W79-07692 5C

FLATFISH
Elemental Distribution in Relation to Skin Necroses of Marine Flatfishes from the English Channel,
W79-07597 5C

FLAVOBACTERIUM
Experimental Degradation of Crude Oil by Marine Bacteria,
W79-07594 5B

FLOCCULATION
Strength Properties of Liquid-Borne Flocculated Matter,
W79-07578 5F

Compatibility of Flocculating Agents with RDX/TNT/Comp B,
W79-07787 5D

The Effect of Polyacrylamide Molecular Structure on Flocculation Activity of Domestic Sewage,
W79-07805 5D

Sewage Treatment in Mining, Metallurgical and Oil-Chemical Industries,
W79-07822 5D

Inorganic Suspended Sludge Dewatering,
W79-07834 5E

FLOOD-DEPTH RELATIONSHIPS
Exceedance Probability - Depth Relationships of Floods for Maryland Streams West of Chesapeake Bay,
W79-07941 2E

FLOOD FLOW
Interaction Between Main Channel and Flood-Plain Flows,
W79-07553 2E

FLOOD FORECASTING
Exceedance Probability - Depth Relationships of Floods for Maryland Streams West of Chesapeake Bay,
W79-07941 2E

Technique for Estimating Magnitude and Frequency of Floods in Delaware,
W79-07942 6A

FLOOD FREQUENCY
Exceedance Probability - Depth Relationships of Floods for Maryland Streams West of Chesapeake Bay,
W79-07941 2E

FLOOD PEAK
Technique for Estimating Magnitude and Frequency of Floods in Delaware,
W79-07942 6A

FLOOD PLAIN INSURANCE
The National Flood Insurance Program Revisited - An Updated Model Ordinance for Implementation of Its Land Management Criteria,
W79-07880 6E

FLOOD PLAIN ZONING
The National Flood Insurance Program Revisited - An Updated Model Ordinance for Implementation of Its Land Management Criteria,
W79-07880 6E

FLOOD PLAINS
Interaction Between Main Channel and Flood-Plain Flows,
W79-07553 2E

The National Flood Insurance Program Revisited - An Updated Model Ordinance for Implementation of Its Land Management Criteria,
W79-07880 6E

FLOOD PROTECTION
The National Flood Insurance Program Revisited - An Updated Model Ordinance for Implementation of Its Land Management Criteria,
W79-07880 6E

FLOOD WAVES
Wave Run-Up Influence on Overtopping of Levees,
W79-07554 2E

FLOODPLAINS
Flood Plain Development Pressures and Federal Programs-Part 1-Case Study Analysis and Recommendations for the '201' Wastewater Treatment Works Program,
W79-07877 6E

Protecting Massachusetts Wetlands,
W79-07908 6E

FLOODS
Choosing Among Alternative Hydrologic Regression Models,
W79-07763 2E

FLOODWATER
Hydrologic Data for North Creek, Trinity River Basin, Texas, 1976,
W79-07698 2E

FLORIDA
Water Resources of the Waccasassa River Basin and Adjacent Areas, Florida,
W79-07712 7C

Springs of Florida,
W79-07946 1A

FLORIDAN AQUIFER
Connector Well Experiment to Recharge the Floridan Aquifer, East Orange County, Florida,
W79-07705 4B

FLOTATION
Waste Water Treatment by Physical and Mechanical Methods,
W79-07813 5D

Use of Floatation for Waste Water Treatment,
W79-07820 5D

Dissolved Air Flotation Thickening as Practiced in the U. S.,
W79-07839 5D

Screening/Flotation Treatment of Combined Sewer Overflows. Volume I - Bench Scale and Pilot Plant Investigations,
W79-07867 5D

FLOW
Flow Characteristics in Two-Dimensional Expansions,
W79-07551 2E

FLOW CHARACTERISTICS
Two-Dimensional Flow Field of Multiport Diffuser,
W79-07535 8B

L.N. Fan's Data on Buoyant Jets in Crossflow,
W79-07536 8B

Flow Characteristics in Two-Dimensional Expansions,
W79-07551 2E

FLOW CONTROL
Reductions in Water Consumption and Flow of Sewage - Report to Congress.
W79-07785 5F

FLOW DURATION
Methodologies for the Determination of Flow Duration Curves at Specific Sites on Ungaged Reaches of Streams,
W79-07579 2E

FLOW RATES
Performance Tests on Full-Scale Tertiary Granular Media Filters,
W79-07821 5D

FLOW RESISTANCE
Flow Resistance in Cobble and Boulder Riverbeds,
W79-07550 2E

FLOW SEPARATION
Flow Characteristics in Two-Dimensional Expansions,
W79-07551 2E

FLUID MECHANICS
Flow Characteristics in Two-Dimensional Expansions,
W79-07551 2E

FLUID MUD
A Field Study of Fluid Mud Dredged Material: Its Physical Nature and Dispersal,
W79-07528 5E

FLUVIAL SEDIMENTS
Sediment Loads in the Amazon River,
W79-07710 2J

FOOD CHAINS
Accumulation of Cadmium by Artemia Salina,
W79-07605 5C

Mercury Accumulation in Ipomoea Aquatica (Forsk) Near a Caustic Soda Factory in Thailand,
W79-07653 5C

Toxic Substances in Opequon Creek, Virginia,
W79-07975 5B

FOOD INDUSTRY
Industrial Sludge Disposl Practices,
W79-07831 5E

FOOD PROCESSING INDUSTRY
Feasibility Study of Waste Water Recovery in Shrimp Processing Plants,
W79-07794 5D

A Method of Manure Disposal for Beef Packing Operation,
W79-07795 5D

Pretreatment of Vegetable Wastewater at the H. J. Heinz Plant in Leamington, Ontario,
W79-07861 5D

FORAMINIFERA
Completion of Shelled Microzoobenthon Samples,
W79-07915 5C

FORECASTING
The San Francisco Bay Delta Wastewater and Residual Solids Management Study. Volume VI. Technical Appendix. The Public Health Implications of Land Application of Wastewater and Residual Solids,
W79-07869 5E

Chattahoochee River Thermal Alterations,
W79-07936 6A

FOREIGN COUNTRIES
Saving the Coast: The British Experience,
W79-07899 6E

FOREST SOILS
Capillary Pressure-Saturation Relationships for a Forest Soil,
W79-07542 2G

FOREST WATERSHEDS
Chemical Characteristics of Small Streams near Haney in Southwestern British Columbia,
W79-07540 2K

FORMALIN
Pseudodactylogyrus Microrchis (Monogenea) on the Gills of Cultured Eels-III Experimental Control by Trichlorfon,
W79-07593 5C

FOULING
The Microfouling Problem and the Future of the Ocean Thermal Energy Conversion (OTEC) Program,
W79-07933 5C

FOUR MILE RUN WATERSHED
Land Use Influences on Metals in Storm Drainage,
W79-07954 5B

FREE SURFACES
Unsteady Interzonal Free Surface Flow in Porous Media,
W79-07768 2G

FRESH WATER FISH
Effects of Thermal Discharges on Freshwater Fishes,
W79-07982 5C

FRESHWATER FISH
The Zoogeography of the Freshwater Fishes of the Potomac River Basin,
W79-07968 2A

FRESHWATER MARSH
Nutrient Dynamics of Freshwater Riverine Marshes and the Role of Emergent Macrophytes,
W79-07734 2K

FRESHWATER MARSHES
Lake Champlain Fisheries Investigation: United States Waters,
W79-07743 2I

FRESHWATER ORGANISMS
Environmental Disturbance and Life Histories: Principles and Examples,
W79-07636 5C

FRIT TECHNIQUE
Reducing the Cost of Continuous Hydrologic-Hydraulic Simulation,
W79-07998 2A

FROGS
The Influence of Rearing Density on the Subsequent Response to DDT Dosing for Tadpoles of the Frog Rana Temporaria,
W79-07663 5C

FROTHING
Use of Floatation for Waste Water Treatment,
W79-07820 5D

FURANS RIVER (FRANCE)
Chemical Contamination by PCBs in the Fishes of a French River: The Furans (Jura),
W79-07618 5C

FURROW IRRIGATION
Electronic Timers for Automated Surface Irrigation Systems,
W79-07989 3F

GAMETOGENESIS
The Effect of Temperature on Growth, Physiology, and Gametogenesis in the Manila Clam Tapes Philippinarum (Adams & Reeve, 1850),
W79-07650 5C

GAMMARUS
Growth and Production of Amphipods Gammarus Olivii at Different Temperatures,
W79-07595 5C

The Effects of Hydrogen Cyanide on Asellus Communis and Gammarus Pseudolimnaeus and Changes in their Competitive Response when Exposed Simultaneously,
W79-07612 5C

The Reproduction Behavior of Gammarus Duebeni (Lilljeborg), and the Inhibitory Effect of a Surface Active Agent,
W79-07672 5C

The Effects of Temperature and Different Food Organisms on the Rate of Gastric Evacuation in Perch (Perca Fluviatilis),
W79-07683 5C

GASTROPODS
Effects of Various Temperature Cycles on the Larval Development of the Gastropod Mollusc Crepidula Fornicata,
W79-07634 5C

GASTROTRICHS
Adaptations to Sulfide in the Meiofauna of the Sulfide System. I. 35S-Sulfide Accumulation and the Presence of a Sulfide Detoxification System,
W79-07652 5B

GEOLOGIC HISTORY
Drainage Evolution and Fish Dispersal in the Central Appalachians: Summary,
W79-07510 2E

The Zoogeography of the Freshwater Fishes of the Potomac River Basin,
W79-07968 2A

GEOSYSTEMS
Modelling the Distribution and Effect of Heavy Metals in an Aquatic Ecosystem,
W79-07686 5C

GEOTHERMAL STUDIES
Geothermal Environmental Impact Assessment: Baseline Data for Four Geothermal Areas in the United States,
W79-07504 2F

GEYSERS
Geothermal Environmental Impact Assessment: Baseline Data for Four Geothermal Areas in the United States,
W79-07504 2F

GLACIAL SOILS
Determination of Hydrologic Parameters for Glacial Tills in Connecticut,
W79-07715 2F

GLACIAL TILL
Determination of Hydrologic Parameters for Glacial Tills in Connecticut,
W79-07715 2F

GOLDFISH
Microbiological Studies on the Nitrogen Cycle in Aquatic Environments - V Nitrogen Metabolism in the Goldfish Culturing Pond,
W79-07592 5B

Relation between Toxicity and Accumulation of Various Chlorophenols in Goldfish,
W79-07614 5B

GONYAULAX
Comparison of Toxins in Three Isolates of Gonyaulax Tamarensis (Dinophyceae),
W79-07620 5A

GRAND VALLEY (CO)
Evapotranspiration Computed to Estimate Leaching Fractions,
W79-07546 2D

GRANTS
Proceedings of the Seminar on Current Approaches in Wastewater Treatment.
W79-07842 5D

Federal Water Pollution Control Act Construction Grants,
W79-07884 6E

GREAT BRITAIN
A Physically Based, Variable Contributing Area Model of Basin Hydrology,
W79-07753 2A

GREAT LAKES
The Transport and Resuspension of Sediments in a Shallow Lake,
W79-07541 2H

GREAT ONYX CAVE (KY)
An Isotopic Study of Groundwater Seepage in the Central Kentucky Karst,
W79-07757 2F

GROUND WATER
Impact of the Law Regulating Drinking Water on Water Resources Management,
W79-07716 6E

GROUND WATER RESOURCES
Colorado Ground Water Up for Grabs.
W79-07631 6E

GROUNDWATER
Groundwater Contour Mapping in Venice by Stochastic Interpolators, 1. Theory,
W79-07559 2F

Groundwater Contour Mapping in Venice by Stochastic Interpolators, 2. Results,
W79-07560 2F

N15/N14 Ratios of Ground-Water Nitrate, Long Island, New York,
W79-07697 5B

U.S. Geological Survey, Denver, Colorado, Radiocarbon Dates II,
W79-07707 2F

An Isotopic Study of Groundwater Seepage in the Central Kentucky Karst,
W79-07757 2F

Innovations Simplify Shallow Well Monitoring,
W79-07761 7B

Spatial Variability and Uncertainty in Groundwater Flow Parameters: A Geostatistical Approach,
W79-07766 2H

Treatment of Primary Sewage Effluent by Rapid Infiltration,
W79-07792 5D

Updating Groundwater Law: New Wine in Old Bottles,
W79-07894 6E

Ground and Surface Water in New Mexico: Are They Protected Against Uranium Mining and Milling,
W79-07896 6E

Cappaert V. United States: A Dehydration of Private Groundwater Use,
W79-07904 6E

Current Groundwater Law in Arizona,
W79-07909 6E

Map Showing General Quality of Ground Water in the Kaiparowits Coal-Basin Area, Utah,
W79-07937 2K

Water Resources of the Kodiak-Shelikof Subregion, South-Central Alaska,
W79-07939 7C

Hydrology of the Beaver Valley Area, Beaver County, Utah, with Emphasis on Ground Water,
W79-07945 7C

Northern Groundwater and Engineering Problems Related to Groundwater Flow,
W79-07956 2F

Development of Methods for Sampling, Preserving and Analyzing Contaminated Ground Waters and Aquifer Sediments,
W79-07957 5B

Arsenic Contamination of Ground Water in the Maritimes,
W79-07960 5A

GROUNDWATER AVAILABILITY
Map Showing General Availability of Ground Water in the Kaiparowits Coal-Basin Area, Utah,
W79-07938 4B

GROUNDWATER FLOW
Northern Groundwater and Engineering Problems Related to Groundwater Flow,
W79-07956 2F

GROUNDWATER MOVEMENT
Effect of Drain Diameter, Openings and Envelopes on Water Table Drawdown,
W79-07545 2F

GROUNDWATER RECHARGE
Connector Well Experiment to Recharge the Floridan Aquifer, East Orange County, Florida, W79-07705 4B

Use of Storm-Water Basins for Artificial Recharge with Reclaimed Water, Nassau County, Long Island, New York--A Hydraulic Feasibility Study, W79-07948 4B

Records of Ground-Water Recharge and Discharge for the Edwards Aquifer in the San Antonio Area, Texas, 1934-77, W79-07949 2F

Modelling Subsurface Irrigation Return Flow, W79-07958 4B

Hydrogeology of Irrigation Return Flow, W79-07959 4B

GROUNDWATER RESOURCES
A Geohydrologic Overview for the Pecora Symposium Field Trip, June 1979, W79-07699 2A

Jordan Aquifer of Iowa, W79-07769 2F

Updating Groundwater Law: New Wine in Old Bottles, W79-07894 6E

Groundwater - A Filter for a Muddy Issue. (Landowners' Rights to Groundwater as Governed by the Nebraska Preferential Use Statute), W79-07913 6E

The Citronelle Aquifers in Mississippi, W79-07940 7C

Water for Municipal and Industrial Development in Hinds, Madison, and Rankin Counties, Mississippi, W79-07944 7C

Ground-Water Data for Michigan, 1977, W79-07947 2F

GROUNDWATER SUBUNITS
Map of Antelope Valley-East Kern Water Agency Area, California, Showing Ground-Water Subunits and Areas, Location of Wells, and Lines of Equal Depth to Water for Spring, 1978, W79-07701 7C

GROWTH RATES
Growth and Production of Amphipods Gammarus Olivii at Different Temperatures, W79-07595 5C

Effect of Methamidophos on the Growth Rate and Esterase Activity of the Common Carp Cyprinus Carpio L. W79-07607 5C

Growth Dynamics of Cordgrass, Spartina Alterniflora, Loisel., on Control and Sewage Sludge Fertilized Plots in a Georgia Salt Marsh, W79-07681 5C

GROWTH STAGES
Effects of Thermal Discharge on Aquatic Insects in the Tennessee Valley, W79-07505 5C

GUAM
Freshwater Use Customs on Guam-An Exploratory Study, W79-07569 6E

GUJARAT STATE (INDIA)
Hydrochemical Evidence of Sea Water Intrusion Along the Mangrol-Chorwad Coast of Saurashtra, Gujarat, W79-07752 2L

HABITAT DEVELOPMENT
Habitat Development Field Investigations, Buttermilk Sound Marsh Development Site, Atlantic Intracoastal Waterway, Georgia; Summary Report, W79-07526 5E

Handbook for Terrestrial Wildlife Habitat Development of Dredged Material, W79-07527 5E

Habitat Development Field Investigations, Port St. Joe Seagrass Demonstration Site, Port St. Joe, Florida; Summary Report, W79-07531 5E

HABITAT IMPROVEMENT
Inertia and Elasticity as a Stream Classification System: Youghiogheny River Case History Evaluation, W79-07508 5C

HABITATS
Habitat Development Field Investigations, Buttermilk Sound Marsh Development Site, Atlantic Intracoastal Waterway, Georgia; Summary Report, W79-07526 5E

Habitat Development Field Investigations, Port St. Joe Seagrass Demonstration Site, Port St. Joe, Florida; Summary Report, W79-07531 5E

HAND PUMPS
Hackmatack Made Reliable Hand Pumps, W79-07723 8C

HATCHING
Calanoid Copepod Eggs in Sea-Bottom Muds. IV. Effects of Some Environmental Factors on the Hatching of Resting Eggs, W79-07642 5B

HAZARDS
Report on Toxic/Hazardous Organic Compounds in the Wabash River Basin, W79-07511 5B

Manual for the Control of Hazardous Material Spills. Volume One. Spill Assessment and Water Treatment Techniques, W79-07868 5B

HEADWATERS
The Hydrological Response of Headwater and Sideslope Areas, W79-07755 2E

HEAT PUMPS
Ground Water Heat Pump Update, W79-07640 8C

HEAT TRANSFER
Effects of a Barrier on Temperature Structure and Mixing in Thermally Stratified Water Cooled from Above, W79-07584 2A

Free Convection in Thermally Stratified Water Cooled from Above, W79-07585 2A

Modeling Highly Transient Flow, Mass, and Heat Transport in the Chattahoochee River Near Atlanta, Georgia, W79-07943 5B

HEAT TREATMENT
Municipal Sludge Management Research Program in the U.S.A., W79-07833 5E

Thermal Drying of Dewatered Sewage Sludge, W79-07836 5E

Operational Experience with the Zimpro Low-Pressure Wet Air Oxidation Process, W79-07845 5E

HEATED WATER
Buoyant Jet Discharge into Finite Ambient Waters, W79-07532 5B

HEAVY METALS
A Field Study of the Relationship between Heavy Metal Concentrations in Stream Water and Selected Benthic Macroinvertebrate Species, W79-07570 5B

Metal Contents of the Two Marine Algae Found on Iron Ore Tailings, W79-07609 5B

Residual Heavy Metal Removal by an Algae-Intermittent Sand Filtration System, W79-07638 5C

Sources of Heavy Metal Contamination in a River-Lake System, W79-07649 5A

Phytoplankton Community of an Acidified Heavy Metal-Contaminated Lake Near Sudbury, Ontario: 1973-1977, W79-07661 5C

A Mathematical Model for the Uptake of Heavy Metals in Benthic Algae, W79-07680 5C

The Distribution of Heavy Metals in the Hard Clam, Mercenaria Mercenaria, in the Lower Chesapeake Bay Region, W79-07685 5B

Modelling the Distribution and Effect of Heavy Metals in an Aquatic Ecosystem, W79-07686 5C

The Sources and Behavior of Heavy Metals in Wastewater and Sludges, W79-07782 5B

Final Report on Fate of Metals Applied in Sewage at Land Wastewater Disposal Sites, W79-07789 5B

Evaluation of Leachate Treatment Volume I Characterization of Leachate, W79-07807 5D

Discharge of Heavy Metals to Municipal Sewers 'The Crunch May Come', W79-07850 5D

Land Use Influences on Metals in Storm Drainage, W79-07954 5B

Toxic Materials in the Aquatic Environment W79-07962 6C

HEXABARBITAL
Effect of Phenobarbital and Hexobarbital Treatment on Lepidocephalichthys Thermalis, A Fresh Water Fish, W79-07611 5C

HEXANE
Induction of Benzo (a) Pyrene Monooxygenase in Fish and the Salmonella Test as a Tool for Detecting Mutagenic/Carcinogenic Xenobiotics in the Aquatic Environment, W79-07669 5C

HINDS COUNTY (MISS)
Water for Municipal and Industrial Development in Hinds, Madison, and Rankin Counties, Mississippi, W79-07944 7C

HISTOLOGY
The Effect of Temperature on Growth, Physiology, and Gametogenesis in the Manila Clam Tapes Philippinarum (Adams & Reeve, 1850) W79-07650 5C

HISTORY
Water in the West,
W79-07696 6B

HOMARUS
The Effect of Temperature on the Toxicity of Chlorinated Cooling Waters to Marine Animals-A Preliminary Review,
W79-07639 5C

HUMAN DISEASES
The Survival of Human Enteric Viruses in Holding Ponds,
W79-07790 5D

HUMIC ACIDS
Factors Influencing pH in Lake Water,
W79-07687 5A

HYDRAULIC MACHINERY
Improvement of Hydraulic Conditions of Radial Settling Tanks,
W79-07815 5D

HYDRAULIC MODELS
Side Weir in Rectangular Channel,
W79-07534 8B

HYDRAULIC STRUCTURES
Two-Dimensional Flow Field of Multiport Diffuser,
W79-07535 8B

LEPIDOCEPHALICHTHYS
Effect of Phenobarbital and Hexobarbital Treatment on Lepidocephalichthys Thermalis, A Fresh Water Fish,
W79-07611 5C

LETHAL LIMIT
Cadmium Toxicity of Laboratory and Field Populations of Daphnia Galeata Mendotae,
W79-07616 5C

Survival of Euglena Gracilis Exposed to Sublethal Temperature and Hexavalent Chromium,
W79-07770 5C

LEVEES
Wave Run-Up Influence on Overtopping of Levees,
W79-07554 2E

LIMANDA
Elemental Distribution in Relation to Skin Necroses of Marine Flatfishes from the English Channel,
W79-07597 5C

LIMPTES
Some Ecological Effects of the Venpet - Venoil Collision,
W79-07684 5C

LINDANE
Effect of Methamidophos on the Growth Rate and Esterase Activity of the Common Carp Cyprinus Carpio L.
W79-07607 5C

The Chronic Toxicity of Carbaryl and Lindane to the Freshwater Mollusc Lymnea Stagnalis L. (Toxicite Chronique du Carbaryl et du Lindane Chez le Mollusque d'eau Lymnea Stagnalis L),
W79-07624 5C

Acute Toxicity of Dechlorinated DDT, Chlordane and Lindane to Bluegill (Lepomis Macrochirus) and Daphnia Magna,
W79-07671 5C

LININGS
Liner Materials Exposed to Hazardous and Toxic Sludges,
W79-07779 8G

LIQUID WASTES
The Role of the Ministry of the Environment in the Disposal of Liquid Industrial Waste in Ontario,
W79-07856 5D

LISTERIA
Experimental Degradation of Crude Oil by Marine Bacteria,
W79-07594 5B

LITTORAL
Intertidal Ecology of the Sea Shore Near Tarapur Atomic Power Station,
W79-07677 5C

LIZARDS
Organochlorine Insecticide Residues in Amphibians and Reptiles from Iowa and Lizards from the Southwestern United States,
W79-07667 5C

LOBSTERS
Toxicity of Permethrin, Decamethrin, and Related Pyrethroids to Salmon and Lobster,
W79-07654 5C

LOCK AND DAM NO. 26
Single-Valve Prototype Tests, Main Lock, Locks and Dam 26, Mississippi River, Alton, Illinois,
W79-07530 8A

LOCKS
Single-Valve Prototype Tests, Main Lock, Locks and Dam 26, Mississippi River, Alton, Illinois,

Spatial Variability and Uncertainty in Groundwater Flow Parameters: A Geostatistical Approach,
W79-07766 2H

An Investigation into the Effect of Storm Type on Precipitation in a Small Mountain Watershed,
W79-07767 2B

Unsteady Interzonal Free Surface Flow in Porous Media,
W79-07768 2G

Chattahoochee River Thermal Alterations,
W79-07936 6A

Modeling Highly Transient Flow, Mass, and Heat Transport in the Chattahoochee River Near Atlanta, Georgia,
W79-07943 5B

MOISTURE STRESS
Evaluation of Crop Water Stress under Limited Irrigation,
W79-07892 2I

MOLECULAR STRUCTURE
The Effect of Polyacrylamide Molecular Structure on Flocculation Activity of Domestic Sewage,
W79-07805 5D

MOLLUSKS
The Chronic Toxicity of Carbaryl and Lindane to the Freshwater Mollusc Lymnea Stagnalis L. (Toxicite Chronique du Carbaryl et du Lindane Chez le Mollusque d'eau Lymnea Stagnalis L),
W79-07624 5C

The Changing Molluscan Community,
W79-07981 5C

MOLTING
Comparison of the Effects of Fourteen-Day and Chronic Exposures to a Polychlorinated Biphenyl, Aroclor 1242, on Molting of the Fiddler Crab, Uca Pugilator,
W79-07662 5C

MONITORING
Innovations Simplify Shallow Well Monitoring,
W79-07761 7B

Investigation of the Orion Research Ammonia Monitor,
W79-07776 7B

The Control of Hydrogen Sulphide Emissions at Ontario Hydro's Bruce Heavy Water Plant,
W79-07851 5D

Pollution Abatement at Canada Starch - A Case Study,
W79-07854 5D

MONSOONS
Observations on the Environmental Characteristics of Pulicat Lake,
W79-07694 5B

MORTALITY
Review of Oxygen Depletion and Associated Mass Mortalities of Shellfish in the Middle Atlantic Bight in 1976,
W79-07596 5C

Expansion of a Central California Kelp Forest Following the Mass Mortality of Sea Urchins,
W79-07601 5B

Chronic Lead Poisoning in a Herd of Mute Swans,
W79-07608 5C

MUD
A Field Study of Fluid Mud Dredged Material: Its Physical Nature and Dispersal,
W79-07528 5E

MUD FLATS
Muddy Foreshores,
W79-07720 2L

MULLETS
Induction of Benzo (a) Pyrene Monooxygenase in Fish and the Salmonella Test as a Tool for Detecting Mutagenic/Carcinogenic Xenobiotics in the Aquatic Environment,
W79-07669 5C

MUNICIPAL WASTES
Cost of Landspreading and Hauling Sludge from Municipal Wastewater Treatment Plants. Case Studies,
W79-07777 5E

Aspects of State-Wide Emergency Response Programs for Municipal Wastewater Treatment Facilities Program,
W79-07797 5G

Application of Sequencing Batch Reactors for Treatment of Municipal and Industrial Wastewaters (First Annual Report, July 1, 1976 to June 30, 1977),
W79-07800 5D

USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, Held at Cincinnati, Ohio on April 5-6, 1977,
W79-07811 5D

The Swirl Concentrator for Treating and Regulating Sewered (Separate and Combined) and Unsewered Flows,
W79-07823 5D

Sewage Treatment of the City of Moscow,
W79-07824 5D

Handling, Treatment and Disposal of Wastewater Sludge.
W79-07825 5D

Discharge of Heavy Metals to Municipal Sewers 'The Crunch May Come',
W79-07850 5D

Effluent Toxicity Testing,
W79-07974 5A

Biomonitoring of Pulp and Paper Effluents,
W79-07983 5A

MUSSELS
Vessel-Related Contamination of Southern California Harbours by Copper and Other Metals,
W79-07628 5C

Uptake and Loss of Zinc and Lead by Mussels (Mytilus Edulis) and Relationships with Body Weight and Reproductive Cycle,
W79-07646 5C

Schema of Lethal Action of Copper on Mussels,
W79-07670 5C

MUTAGENS
Studies on Intraperitoneal Toxicity of Lead to Cichlasoma Nigrofasciatum (Guenther) Development,
W79-07617 5C

Embryotoxicity and Hatchability in Cichlasoma Nigrofasciatum (Guenther) Eggs and Larvae Briefly Exposed to Low Concentrations of Zinc and Copper Ions,
W79-07668 5C

Induction of Benzo (a) Pyrene Monooxygenase in Fish and the Salmonella Test as a Tool for Detecting Mutagenic/Carcinogenic Xenobiotics in the Aquatic Environment,
W79-07669 5C

MUTE SWAN
Chronic Lead Poisoning in a Herd of Mute Swans,
W79-07608 5C

MYA
Cadmium Sorption in Estuarine Mud-Type Sediment and the Accumulation of Cadmium in the Soft-Shell Clam, Mya Arenaria,
W79-07691 5C

MYOPEA
Adaptations to Sulfide in the Meiofauna of the Sulfide System. I. 35S-Sulfide Accumulation and the Presence of a Sulfide Detoxification System,
W79-07652 5B

MYTILUS
Vessel-Related Contamination of Southern California Harbours by Copper and Other Metals,
W79-07628 5C

Uptake and Loss of Zinc and Lead by Mussels (Mytilus Edulis) and Relationships with Body Weight and Reproductive Cycle,
W79-07646 5C

Schema of Lethal Action of Copper on Mussels,
W79-07670 5C

NAPHTHALENE
Detection of Naphthalene by the Blue Crab, Callinectes Sapidus,
W79-07676 5A

NAPHTHALENES
Interactive Effects of Salinity, Temperature and Chronic Exposure to Oil on the Survival and Developmental Rate of Embryos of the Estuarine Killifish Fundulus Heteroclitus,
W79-07635 5C

Effects of Temperature on the Median Tolerance Limit of Pink Salmon and Shrimp Exposed to Toluene, Naphthalene, and Cook Inlet Crude Oil,
W79-07637 5C

NATIONAL WATER DATA STORAGE AND RETRIEVAL SYSTEM (WATSTORE)
The National Water Data Storage and Retrieval System (WATSTORE) of the U.S. Geological Survey,
W79-07952 10A

NATURAL RESOURCES
Natural Resources of Coastal Wetlands in Northern Santa Barbara County,
W79-07728 2L

The Natural Resources of Carpinteria Marsh, Their Status and Future. Report Number 13 on California Coastal Wetlands,
W79-07729 2L

NEBRASKA
Groundwater - A Filter for a Muddy Issue. (Landowners' Rights to Groundwater as Governed by the Nebraska Preferential Use Statute),
W79-07913 6E

NEPHELOID LAYER
Biological Characterization of the Nepheloid Layer,
W79-07926 5C

NEREIS
Remobilization of Sediment-Associated PCBs by the Worm Nereis Diversicolor,
W79-07623 5C

NEUTRALIZATION
Demonstration of a Leachate Treatment Plant,
W79-07775 5D

Assessment in Industrial Hazardous Waste Management Petroleum Re-Refining Industry,
W79-07781 5E

NEW MEXICO
Ground and Surface Water in New Mexico: Are They Protected Against Uranium Mining and Milling,
W79-07896 6E

Pueblo Indian Water Rights: Who Will Get the Water,
W79-07912 6E

NEW YORK
N15/N14 Ratios of Ground-Water Nitrate, Long Island, New York,
W79-07697 5B

NIPOMO DUNES
The Natural Resources of the Nipomo Dunes and Wetlands. Report Number 15 on California Coastal Wetlands,
W79-07730 2L

NITRATES
Temperature and pH as Limiting Factors in Loss of Nitrate from Saturated Atlantic Coastal Plain Soils,
W79-07564 2K

Voltammetric Ion Selective Electrode for the Determination of Nitrate,
W79-07586 5A

N15/N14 Ratios of Ground-Water Nitrate, Long Island, New York,
W79-07697 5B

NITRIFICATION
Role of Treatability Studies for the Design and Operation of Nitrification in Activated Sludge Plants,
W79-07846 5D

New Developments Utilizing Fixed Film Biological Processes,
W79-07847 5D

NITROGEN
Methylamine Uptake in the Green Alga Chlorella Pyrenoidosa,
W79-07613 5C

N15/N14 Ratios of Ground-Water Nitrate, Long Island, New York,
W79-07697 5B

Performance and Economics of the System,
W79-07866 5D

Rooted Aquatic Plants,
W79-07965 5A

NITROGEN CYCLE
Microbiological Studies on the Nitrogen Cycle in Aquatic Environments - V Nitrogen Metabolism in the Goldfish Culturing Pond,
W79-07592 5B

NONLINEAR PROGRAMMING
Analysis of Closed Conduit Irrigation System and Its Subdivision,
W79-08000 6A

NORCROSS (GA)
Modeling Highly Transient Flow, Mass, and Heat Transport in the Chattahoochee River Near Atlanta, Georgia,
W79-07943 5B

NORTH CREEK
Hydrologic Data for North Creek, Trinity River Basin, Texas, 1976,
W79-07698 2E

NORTHEAST U.S.
Annual Precipitation in the Northeast United States: Long Memory, Short Memory, or No Memory,
W79-07555 2B

NOTOPTERUS
Studies on the Toxicity of Pulp and Paper Factory Wastes to the Fish Notopterus Notopterus (Pallas),
W79-07659 5C

NUCLEAR POWERPLANTS
Intertidal Ecology of the Sea Shore Near Tarapur Atomic Power Station,
W79-07677 5C

NUCLEIC ACIDS
Effect of High Concentrations of Petroleum and Phenol on the Metabolism of Nucleic Acids of Algae Macrophytes,
W79-07599 5C

NUTRIENT REMOVAL
Nutrient Modeling,
W79-07988 5B

NUTRIENTS
Changes in Phytoplankton Physiology and Morphology in Response to Dissolved Nutrients in Lough Neagh, N. Ireland,
W79-07621 5A

Nutrient Budget Analysis for Rend Lake in Illinois,
W79-07748 5A

Rooted Aquatic Plants,
W79-07965 5A

Nutrient Modeling,
W79-07988 5B

OCCOQUAN WATERSHED
Land Use Influences on Metals in Storm Drainage,
W79-07954 5B

OCEAN THERMAL ENERGY CONVERSION (OTEC)
The Microfouling Problem and the Future of the Ocean Thermal Energy Conversion (OTEC) Program,
W79-07933 5C

OHIO
Updating Groundwater Law: New Wine in Old Bottles,
W79-07894 6E

OIL
Experimental Degradation of Crude Oil by Marine Bacteria,
W79-07594 5B

Effect of High Concentrations of Petroleum and Phenol on the Metabolism of Nucleic Acids of Algae Macrophytes,
W79-07599 5C

Interactive Effects of Salinity, Temperature and Chronic Exposure to Oil on the Survival and Developmental Rate of Embryos of the Estuarine Killifish Fundulus Heteroclitus,
W79-07635 5C

Resistance of Bacterial Chemotaxis to Blockage in Petroleum Waters,
W79-07641 5C

Alkanes in Plankton from the Buccaneer Oilfield,
W79-07655 5C

Expanded Offshore Leasing and the Mandates of Nepa,
W79-07898 5B

Recent Congressional Action on Outer Continental Shelf Oil and Gas Development,
W79-07906 6E

OIL INDUSTRY
Petroleum Industry in the Delaware Estuary,
W79-07725 2L

Assessment in Industrial Hazardous Waste Management Petroleum Re-Refining Industry,
W79-07781 5E

Washington State Refineries: Petroleum, Petroleum Derivatives and Wastewater Effluent Characteristics,
W79-07799 5B

Cyanide Removal from Petroleum Refinery Waste Water Using Powdered Activated Carbon,
W79-07806 5D

Physical Treatment of Oil Refinery Wastewater,
W79-07814 5D

The Control of Refinery Mechanical Waste Water Treatment Processes by Controlling the Zeta Potential,
W79-07818 5D

Use of Floatation for Waste Water Treatment,
W79-07820 5D

Management of Oil Sludge from a Refinery Waste Water Treatment Plant,
W79-07828 5E

Industrial Sludge Disposl Practices,
W79-07831 5E

Development and Implementation of an Improved Waste Water Treatment System at Imperial's Sarina Refinery,
W79-07853 5D

OIL POLLUTION
Alkanes in Plankton from the Buccaneer Oilfield,
W79-07655 5C

Some Ecological Effects of the Venpet - Venoil Collision,
W79-07684 5C

Development of Mini-Computer Programming to Aid in Interpretation of Mass Spectral Data,
W79-07924 5A

OIL SPILLS
Effects of Temperature on the Median Tolerance Limit of Pink Salmon and Shrimp Exposed to Toluene, Naphthalene, and Cook Inlet Crude Oil,
W79-07637 5C

The Effects of an Experimental Spillage of Oil Sands Tailings Sludge on Benthic Invertebrates,
W79-07665 5C

Some Ecological Effects of the Venpet - Venoil Collision,
W79-07684 5C

Fate of Petroleum-Derived Aromatic Compounds in Seawater Held in Outdoor Tanks,
W79-07923 5C

OCS Development and Commercial and Recreational Fishing,
W79-07934 5C

OIL WASTES
Treatment and Stabilization of Polychlorinated Biphenyls (PCBs) Contaminated Water and Waste Oil-A Case Study. Whitehouse, Florida,
W79-07778 5D

Washington State Refineries: Petroleum, Petroleum Derivatives and Wastewater Effluent Characteristics,
W79-07799 5B

Cyanide Removal from Petroleum Refinery Waste Water Using Powdered Activated Carbon,
W79-07806 5D

Management of Oil Sludge from a Refinery Waste Water Treatment Plant,
W79-07828 5E

OILY WATER
Wastewater Treatment and Oil Reclamation at General Motors, St. Catherines,
W79-07855 5D

Treatment and Recovery of Emulsified Oil by Ultrafiltration,
W79-07862 5D

ON-SITE COLLECTIONS
Management of Small Waste Flows.
W79-07774 5D

ON-SITE INVESTIGATIONS
Separation of Algal Cells from Wastewater Lagoon Effluents, Vol. III: Soil Mantle Treatment of Wastewater Stabilization Pond Effluent - Sprinkler Irrigation,
W79-07870 5D

ON-SITE TESTS
Variations in Specific Yield in the Outcrop of the Carrizo Sand in South Texas as Estimated by Seismic Refraction,
W79-07750 2F

Shipboard Evaluation of a Carlson Mark 10 Chlorinator/Macerator Sanitary Waste-Water Treatment System,
W79-07801 5D

OPEN CHANNEL FLOW
Interaction Between Main Channel and Flood-Plain Flows,
W79-07553 2E

Junction Losses in Open Channel Flows,
W79-07582 2E

Modeling Highly Transient Flow, Mass, and Heat Transport in the Chattahoochee River Near Atlanta, Georgia,
W79-07943 5B

OPEN WATER DISPOSAL
Field Investigations of the Nature, Degree, and Extent of Turbidity Generated by Open-Water Pipeline Disposal Operations,
W79-07524 5E

A Field Study of Fluid Mud Dredged Material: Its Physical Nature and Dispersal,
W79-07528 5E

OPERATION AND MAINTENANCE
Assessment of Low-Ground-Pressure Equipment for Use in Containment Area Operation and Maintenance,
W79-07520 5E

OPTIMIZATION
Optimal Design of Culverts under Uncertainties,
W79-07549 2E

A Reservoir Operating Model with Inorganic Quality Constraints for the Truckee River,
W79-07562 4A

The Control of Refinery Mechanical Waste Water Treatment Processes by Controlling the Zeta Potential,
W79-07818 5D

Thickening of Sludges,
W79-07838 5D

Dissolved Air Flotation Thickening as Practiced in the U. S.,
W79-07839 5D

Role of Treatability Studies for the Design and Operation of Nitrification in Activated Sludge Plants,
W79-07846 5D

ORGANIC COMPOUNDS
An Index of Refractory Organics,
W79-07784 5A

ORGANIC LOADING
Report on Toxic/Hazardous Organic Compounds in the Wabash River Basin,
W79-07511 5B

Storm Runoff and Combined Sewers in Washington, D. C.,
W79-07986 5B

ORGANIC MATTER
Utilization of Soil Invertebrates in Stabilization, Decontamination, and Detoxification of Residual Sludges from Treatment of Wastewater (Interim Report),
W79-07802 5E

The Effect of Polyacrylamide Molecular Structure on Flocculation Activity of Domestic Sewage,
W79-07805 5D

ORGANIC PESTICIDES
Organic Compounds in Organophosphorus Pesticide Manufacturing Wastewaters,
W79-07513 5E

ORGANIC WASTES
Report on Toxic/Hazardous Organic Compounds in the Wabash River Basin,
W79-07511 5B

ORGANOPHOSPHORUS PESTICIDES
Organic Compounds in Organophosphorus Pesticide Manufacturing Wastewaters,
W79-07513 5E

Organophosphate Poisoning to Some Fresh Water Teleosts - Acetylcholinesterase Inhibition,
W79-07626 5C

ORIFICES
Connector Well Experiment to Recharge the Floridan Aquifer, East Orange County, Florida,
W79-07705 4B

OSCILLATORIA
Residual Heavy Metal Removal by an Algae-Intermittent Sand Filtration System,
W79-07638 5C

OUTER CONTINENTAL SHELF
Completion of Shelled Microzoobenthon Samples,
W79-07915 5C

Analyses of 1975-76 Microzooplankton Samples from Transect II,
W79-07916 5G

Determination of Average Dry Weights of Important Neuston Species Collected in 1976,
W79-07917 5C

Bureau of Land Management South Texas Outer Continental Shelf Report of Consultancy on Benthic Ecology Programme - 22 August - 11 September and 24 October - 5 November,
W79-07918 5C

Macroinvertebrate Study,
W79-07919 5C

Biomass Measurements of Benthic Invertebrates,
W79-07920 5C

Addendum to Histopathology of Demersal Fishes. Histopathology of Micropogon Undulatus (Atlantic Croaker) Exposed to Water Soluble Fractions of South Louisiana Crude Oil,
W79-07921 5C

An Intensive Study of the Heavy Hydrocarbons in the Suspended Particulate Matter of Seawater,
W79-07922 5B

Fate of Petroleum-Derived Aromatic Compounds in Seawater Held in Outdoor Tanks,
W79-07923 5C

Development of Mini-Computer Programming to Aid in Interpretation of Mass Spectral Data,
W79-07924 5A

Development of a Chelating/Co-Precipitation Procedure for Matrix-Free Analysis of Various Metals in Organisms from the South Texas OCS by Atomic Absorption Spectrophotometry,
W79-07925 5A

Biological Characterization of the Nepheloid Layer,
W79-07926 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume III - Appendices A-F.
W79-07927 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume IV - Appendices G - I,
W79-07928 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume V - Appendices J - M,
W79-07929 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume VI - Appendices N - S,
W79-07930 5C

Federal Role in OCS Oil and Gas Development.
W79-07931 5C

Study Design for Resource Management Decisions: OCS Oil and Gas Development and the Environment.
W79-07932 5C

The Microfouling Problem and the Future of the Ocean Thermal Energy Conversion (OTEC) Program,
W79-07933 5C

OCS Development and Commercial and Recreational Fishing,
W79-07934 5C

OUTFALL SEWERS
Two-Dimensional Flow Field of Multiport Diffuser,
W79-07535 8B

OVERFLOW
Aspects of State-Wide Emergency Response Programs for Municipal Wastewater Treatment Facilities Program,
W79-07797 5G

Screening/Flotation Treatment of Combined Sewer Overflows. Volume I - Bench Scale and Pilot Plant Investigations,
W79-07867 5D

Storm Runoff and Combined Sewers in Washington, D. C.,
W79-07986 5B

OXIDATION
Closed Loop System for the Treatment of Waste Pickle Liquor,
W79-07783 5D

Proceedings of the Seminar on Current Approaches in Wastewater Treatment.
W79-07842 5D

Operational Experience with the Zimpro Low-Pressure Wet Air Oxidation Process,
W79-07845 5E

OXIDATION LAGOONS
Application of Oxygen to Treat Waste from Military Field Installations, Part I. Inactivation of Virus in Bench-Scale Oxygenated Waste Stabilization Ponds.
W79-07809 5D

OXYGEN
Calanoid Copepod Eggs in Sea-Bottom Muds. IV. Effects of Some Environmental Factors on the Hatching of Resting Eggs,
W79-07642 5B

OXYGEN REQUIREMENTS
Oxygen Consumption in Daphnia Pulex Exposed to 2,4-D or 2,4,5-T,
W79-07666 5C

OXYGEN SAG
Review of Oxygen Depletion and Associated Mass Mortalities of Shellfish in the Middle Atlantic Bight in 1976,
W79-07596 5C

OXYGENATION
Application of Oxygen to Treat Waste from Military Field Installations, Part I. Inactivation of Virus in Bench-Scale Oxygenated Waste Stabilization Ponds,
W79-07809 5D

Application of Oxygen to Treat Waste from Military Field Installations Part II. An Evaluation of an Activated Sludge Process Employing Downflow Bubble Contact Aeration,
W79-07810 5D

OYSTERS
PCBs and Organochlorine Insecticides in Oysters from Coastal Lagoons of the Gulf of Mexico, Mexico,
W79-07630 5C

OZONE
Evaluating Disinfection Alternatives,
W79-07848 5D

PACKED BEDS
New Developments Utilizing Fixed Film Biological Processes,
W79-07847 5D

Pretreatment of Vegetable Wastewater at the H. J. Heinz Plant in Leamington, Ontario,
W79-07861 5D

PAINTS
Vessel-Related Contamination of Southern California Harbours by Copper and Other Metals,
W79-07628 5C

PALAEMONETES
Distribution of Mirex in an Experimental Estuarine Ecosystem,
W79-07682 5C

PATH OF POLLUTANTS
Ground-Water Hydrology and Subsurface Migration of Radioisotopes at a Low-Level Solid Radioactive-Waste Disposal Site, West Valley, New York,
W79-07713 5B

Development of Methods for Sampling, Preserving and Analyzing Contaminated Ground Waters and Aquifer Sediments,
W79-07957 5B

PATHOLOGY
Addendum to Histopathology of Demersal Fishes. Histopathology of Micropogon Undulatus (Atlantic Croaker) Exposed to Water Soluble Fractions of South Louisiana Crude Oil,
W79-07921 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume VI - Appendices N - S,
W79-07930 5C

PEAK DISCHARGE
Exceedance Probability - Depth Relationships of Floods for Maryland Streams West of Chesapeake Bay,
W79-07941 2E

PENALTIES
Assessment of Civil Monetary Penalties for Water Pollution: A Proposal for Shifting the Burden of Proof Regarding Damages,
W79-07907 6E

PENICILLIUM
Methylamine Uptake in the Green Alga Chlorella Pyrenoidosa,
W79-07613 5C

PERCHES
The Effects of Temperature and Different Food Organisms on the Rate of Gastric Evacuation in Perch (Perca Fluviatilis),
W79-07683 5C

PERCOLATION
Long-Term Effects of Land Application of Domestic Wastewater: Hollister, California, Rapid Infiltration Site,
W79-07512 5E

PERFORMANCE
Investigation of the Orion Research Ammonia Monitor,
W79-07776 7B

Demonstration of Ultrafiltration and Carbon Adsorption for Treatment of Industrial Laundering Wastewater,
W79-07786 5D

Washington State Refineries: Petroleum, Petroleum Derivatives and Wastewater Effluent Characteristics,
W79-07799 5B

Application of Sequencing Batch Reactors for Treatment of Municipal and Industrial Wastewaters (First Annual Report, July 1, 1976 to June 30, 1977),
W79-07800 5D

Shipboard Evaluation of a Carlson Mark 10 Chlorinator/Macerator Sanitary Waste-Water Treatment System,
W79-07801 5D

Evaluation of Leachate Treatment Volume 2: Biological and Physical-Chemical Processes,
W79-07808 5D

Waste Water Treatment by Physical and Mechanical Methods,
W79-07813 5D

Physical Treatment of Oil Refinery Wastewater,
W79-07814 5D

Improvement of Hydraulic Conditions of Radial Settling Tanks,
W79-07815 5D

Employment of Microstrainers in the Waste Water Treatment Practice,
W79-07817 5D

Combined Storm Overflow Treatment with SALA-HGMF High Gradient Magnetic Filters,
W79-07819 5D

Use of Floatation for Waste Water Treatment,
W79-07820 5D

Performance Tests on Full-Scale Tertiary Granular Media Filters,
W79-07821 5D

Solid Liquid Separation Utilizing an Inclined Plate Separator and Filter Press,
W79-07852 5D

Conference on Muskegon County, Michigan Wastewater System, September 17-18, 1975, A Critical Review on Evaluations of the System and Identification of Needed Research,
W79-07864 5D

Review of System Design Parameters,
W79-07865 5D

Performance and Economics of the System,
W79-07866 5D

Separation of Algal Cells from Wastewater Lagoon Effluents, Vol. III: Soil Mantle Treatment of Wastewater Stabilization Pond Effluent - Sprinkler Irrigation,
W79-07870 5D

Physical, Chemical, and Biological Treatment Techniques for Industrial Wastes. Volume 1,
W79-07873 5D

PERIDINIUM
Phytoplankton Community of an Acidified, Heavy Metal-Contaminated Lake Near Sudbury, Ontario: 1973-1977,
W79-07661 5C

PERMEAMETERS
Determination of Hydrologic Parameters for Glacial Tills in Connecticut,
W79-07715 2F

PERMETHRIN
Toxicity of Permethrin, Decamethrin, and Related Pyrethroids to Salmon and Lobster,
W79-07654 5C

PERMITS
Volume III. The Wetlands/Edges Program. Research on the Chesapeake Bay to Provide a Knowledge Base for Physical Alterations of the Edges of the Chesapeake Bay,
W79-07724 6G

Developer's Handbook,
W79-07735 6B

PERMSELECTIVE MEMBRANES
High Flux PBI Reverse Osmosis Membranes for Desalination and Water Reuse,
W79-07571 3A

PERSISTENCE
An Index of Refractory Organics,
W79-07784 5A

Toxic Substances in Opequon Creek, Virginia,
W79-07975 5B

PESTICIDE KINETICS
Toxic Substances in Opequon Creek, Virginia,
W79-07975 5B

PESTICIDE REMOVAL
Organic Compounds in Organophosphorus Pesticide Manufacturing Wastewaters,
W79-07513 5E

PESTICIDE RESIDUES
Dieldrin Pollution in the River Holme Catchment, Yorkshire,
W79-07604 5C

Chemical Contamination by PCBs in the Fishes of a French River: The Furans (Jura),
W79-07618 5C

PCBs and Organochlorine Insecticides in Oysters from Coastal Lagoons of the Gulf of Mexico, Mexico,
W79-07630 5C

Organochlorine Insecticide Residues in Amphibians and Reptiles from Iowa and Lizards from the Southwestern United States,
W79-07667 5C

Toxic Substances in Opequon Creek, Virginia,
W79-07975 5B

PESTICIDE TOXICITY
Organophosphate Poisoning to Some Fresh Water Teleosts - Acetylcholinesterase Inhibition,
W79-07626 5C

Modification of the Rheotropic Response of Rainbow Trout (Salmo Gairdneri) by Sublethal Doses of the Aquatic Herbicides Diquat and Simazine,
W79-07645 5C

Toxicity of Permethrin, Decamethrin, and Related Pyrethroids to Salmon and Lobster,
W79-07654 5C

Application of a New Bioassay to Screen the Toxicity of Polychlorinated Biphenyls on Blue-Green Algae,
W79-07658 5A

The Influence of Rearing Density on the Subsequent Response to DDT Dosing for Tadpoles of the Frog Rana Temporaria,
W79-07663 5C

Oxygen Consumption in Lepomis Machrochirus Exposed to 2,4-D or 2,4,5-T,
W79-07664 5C

Oxygen Consumption in Daphnia Pulex Exposed to 2,4-D or 2,4,5-T,
W79-07666 5C

Acute Toxicity of Dechlorinated DDT, Chlordane and Lindane to Bluegill (Lepomis Macrochirus) and Daphnia Magna,
W79-07671 5C

In Vivo Effect on ATPase in Certain Tissues of Labeo Rohita and Saccobranchus Fossilis, Following Chronic Chlordane Intoxication,
W79-07674 5C

Toxic Substances in Opequon Creek, Virginia,
W79-07975 5B

PETROLEUM DEVELOPMENT

Fate of Petroleum-Derived Aromatic Compounds in Seawater Held in Outdoor Tanks,
W79-07923 5C

PHAEOPHYTA

Uptake of Methylamine (An Ammonium Analogue) by Macrocystis Pyrifera (Phaeophyta),
W79-07600 5B

Expansion of a Central California Kelp Forest Following the Mass Mortality of Sea Urchins,
W79-07601 5B

PHENOBARBITAL

Effect of Phenobarbital and Hexobarbital Treatment on Lepidocephalichthys Thermalis, A Fresh Water Fish,
W79-07611 5C

PHENOLS

Effect of High Concentrations of Petroleum and Phenol on the Metabolism of Nucleic Acids of Algae Macrophytes,
W79-07599 5C

Relation between Toxicity and Accumulation of Various Chlorophenols in Goldfish,
W79-07614 5B

Hydrogeological Control and Clean-Up of Soil and Groundwater Contaminants at Northern Wood Preserves, Ltd,
W79-07860 5D

Destroying Chemical Wastes in Commercial Scale Incinerators. Facility Report Number 3 - Systems Technology,
W79-07871 5D

PHEROMONES

The Reproduction Behavior of Gammarus Duebeni (Lilljeborg), and the Inhibitory Effect of a Surface Active Agent,
W79-07672 5C

PHOSPHORUS

Rooted Aquatic Plants,
W79-07965 5A

PHYCOLOGY

Trends in Applied Phycology with a Literature Review: Seaweed Farming on an Industrial Site,
W79-07619 5B

PHYSICAL PROPERTIES

The Dependence of Dewatering Process on Aqueous Properties of Sludges,
W79-07841 1A

PHYTOPLANKTON

Response of Phytoplankton and Bacteria to Water Quality in the Chowan River, North Carolina,
W79-07568 5C

Changes in Phytoplankton Physiology and Morphology in Response to Dissolved Nutrients in Lough Neagh, N. Ireland,
W79-07621 5A

Phytoplankton Community of an Acidified, Heavy Metal-Contaminated Lake Near Sudbury, Ontario: 1973-1977,
W79-07661 5C

Plankton of the Hooghly Estuary with Special Reference to Salinity and Temperature,
W79-07693 5C

Distribution of Phytoplankton in Florida Lakes,
W79-07771 5C

Biological Characterization of the Nepheloid Layer,
W79-07926 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume V - Appendices J - M,
W79-07929 5C

Phytoplankton,
W79-07964 5A

PIEZOMETERS

Hydrogeology of Irrigation Return Flow,
W79-07959 4B

PIKE

Lake Champlain Fisheries Investigation: United States Waters,
W79-07743 2I

PIKES

Effects of Spring Water Levels on the Reproduction of Upper Richelieu and Missisquoi Bay: Northern Pike (Esox Lucius L.),
W79-07742 2I

PILOT PLANTS

Application of Oxygen to Treat Waste from Military Field Installations Part II. An Evaluation of an Activated Sludge Process Employing Downflow Bubble Contact Aeration,
W79-07810 5D

Combined Storm Overflow Treatment with SALA-HGMF High Gradient Magnetic Filters,
W79-07819 5D

Dissolved Air Flotation Thickening as Practiced in the U. S.,
W79-07839 5D

Development and Implementation of an Improved Waste Water Treatment System at Imperial's Sarina Refinery,
W79-07853 5D

Screening/Flotation Treatment of Combined Sewer Overflows. Volume I - Bench Scale and Pilot Plant Investigations,
W79-07867 5D

PINK SALMON

Effects of Temperature on the Median Tolerance Limit of Pink Salmon and Shrimp Exposed to Toluene, Naphthalene, and Cook Inlet Crude Oil,
W79-07637 5C

PLANKTON

Determination of Average Dry Weights of Important Neuston Species Collected in 1976,
W79-07917 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume V - Appendices J - M,
W79-07929 5C

PLANNING

Water Reuse and Recycling, Volume I: Evaluation of Needs and Potential,
W79-07501 6D

Overcoming Legal and Institutional Barriers to Planned Reuse of Water in the Colorado River Basin,
W79-07502 6E

A Water Resource Planning Procedure for Rural Towns,
W79-07561 6A

Levels of Analysis in Comprehensive River Basin Planning,
W79-07577 6B

Legal and Scientific Perspectives,
W79-07993 6E

Cost Analysis of Water and Waste Water Treatment Processes in Developing Countries,
W79-07999 6B

PLANT GROUPINGS

Changes in Vegetation Diversity Caused by Artificial Recharge,
W79-07951 4B

PLANT GROWTH

Growth Dynamics of Cordgrass, Spartina Alterniflora, Loisel., on Control and Sewage Sludge Fertilized Plots in a Georgia Salt Marsh,
W79-07681 5C

PLANT GROWTH SUBSTANCES

Trace and Toxic Metal Uptake by Marsh Plants as Affected by Eh, Ph, and Salinity,
W79-07727 2K

PLANT PHYSIOLOGY

Effect of High Concentrations of Petroleum and Phenol on the Metabolism of Nucleic Acids of Algae Macrophytes,
W79-07599 5C

PLATINUM

Acute Toxicity of Platinum to Coho Salmon (Oncorhynchus Kisutch),
W79-07644 5C

PLEISTOCENE EPOCH

Drainage Evolution and Fish Dispersal in the Central Appalachians: Summary,
W79-07510 2E

PLEURONECTES

Elemental Distribution in Relation to Skin Necroses of Marine Flatfishes from the English Channel,
W79-07597 5C

POISONS

Report on Toxic/Hazardous Organic Compounds in the Wabash River Basin,
W79-07511 5B

POLICY CONSTRAINTS

Overcoming Legal and Institutional Barriers to Planned Reuse of Water in the Colorado River Basin,
W79-07502 6E

POLITICAL CONSTRAINTS

Diffuse Source Pollution: Policy Considerations for the States.
W79-07879 6E

POLLUTANT IDENTIFICATION
Drinking Water and Health Part 2, Chapters 6 and 7, A Report of the Safe Drinking Water Committee,
W79-07591 5C

Results of Investigations, T. E. Maxson WTP and Significant Industrial Contributors, Memphis, Tennessee,
W79-07788 5B

Development of Mini-Computer Programming to Aid in Interpretation of Mass Spectral Data,
W79-07924 5A

Development of a Chelating/Co-Precipitation Procedure for Matrix-Free Analysis of Various Metals in Organisms from the South Texas OCS by Atomic Absorption Spectrophotometry,
W79-07925 5A

Effluent Toxicity Testing,
W79-07974 5A

POLLUTION ABATEMENT
First Order Estimates of Energy Requirements for Pollution Control,
W79-07798 6B

Proceedings of the Twenty-Fifth Silver Anniversary of the Ontario Industrial Waste Conference.
W79-07858 5D

National Water Quality Goals Cannot be Attained without more Attention to Pollution from Diffused or 'Nonpoint' Sources,
W79-07889 2E

The Rising Costs of Mine Drainage Abatement,
W79-07977 5D

Acid Mine Drainage and the Clean Water Act,
W79-07978 6E

Biomonitoring of Pulp and Paper Effluents,
W79-07983 5A

Water Quality Efforts by Chemical Industries,
W79-07984 5A

Congressional Perspectives on Clean Water,
W79-07991 6E

Legal and Scientific Perspectives,
W79-07993 6E

POLYCHLORINATED BIPHENYLS
Chemical Contamination by PCBs in the Fishes of a French River: The Furans (Jura),
W79-07618 5C

Remobilization of Sediment-Associated PCBs by the Worm Nereis Diversicolor,
W79-07623 5C

PCBs and Organochlorine Insecticides in Oysters from Coastal Lagoons of the Gulf of Mexico, Mexico,
W79-07630 5C

Application of a New Bioassay to Screen the Toxicity of Polychlorinated Biphenyls on Blue-Green Algae,
W79-07658 5A

Comparison of the Effects of Fourteen-Day and Chronic Exposures to a Polychlorinated Biphenyl, Aroclor 1242, on Molting of the Fiddler Crab, Uca Pugilator,
W79-07662 5C

Treatment and Stabilization of Polychlorinated Biphenyls (PCBs) Contaminated Water and Waste Oil-A Case Study. Whitehouse, Florida,
W79-07778 5D

Sludge Incineration Systems for Purification and Resource Recovery,
W79-07827 5E

Controlling PCB Discharges to the Environment,
W79-07857 5B

POLYMERS
Compatibility of Flocculating Agents with RDX/TNT/Comp B,
W79-07787 5D

The Effect of Polyacrylamide Molecular Structure on Flocculation Activity of Domestic Sewage,
W79-07805 5D

PONDS
The Survival of Human Enteric Viruses in Holding Ponds,
W79-07790 5D

POOLS
Rhythmic Spacing and Origin of Pools and Riffles,
W79-07566 4A

POPULATION DENSITY
Macroinvertebrate Study,
W79-07919 5C

POROUS MEDIA
Air and Water Movement in Porous Media: Compressibility Effects,
W79-07544 2G

Permeable Wall Effects on Poiseuille Flow,
W79-07749 2E

Unsteady Interzonal Free Surface Flow in Porous Media,
W79-07768 2G

New Developments Utilizing Fixed Film Biological Processes,
W79-07847 5D

PORT ST. JOE (FLA.)
Habitat Development Field Investigations, Port St. Joe Seagrass Demonstration Site, Port St. Joe, Florida; Summary Report,
W79-07531 5E

POTABLE WATER
Drinking Water and Health. Part I, Chapters 1-5. A Report of the Safe Drinking Water Committee,
W79-07590 5C

Drinking Water and Health Part 2, Chapters 6 and 7, A Report of the Safe Drinking Water Committee,
W79-07591 5C

Wastewater Characterization and Process Reliability for Potable Wastewater Reclamation,
W79-07791 5D

POTENTIAL EVAPORATION
An Advection-Aridity Approach to Estimate Actual Regional Evapotranspiration,
W79-07548 2D

POTENTIAL EVAPOTRANSPIRATION
Evapotranspiration Computed to Estimate Leaching Fractions,
W79-07546 2D

POTOMAC RIVER
Microbiological Studies,
W79-07963 5A

Phytoplankton,
W79-07964 5A

The Zoogeography of the Freshwater Fishes of the Potomac River Basin,
W79-07968 2A

POTOMAC RIVER BASIN
Benthic Macroinvertebrates of the Freshwater Potomac,
W79-07966 5C

PRECIPITATION (ATMOSPHERIC)
Annual Precipitation in the Northeast United States: Long Memory, Short Memory, or No Memory,
W79-07555 2B

An Investigation into the Effect of Storm Type on Precipitation in a Small Mountain Watershed,
W79-07767 2B

PREDICTIVE EQUATIONS
Cost Analysis of Water and Waste Water Treatment Processes in Developing Countries,
W79-07999 6B

PRESERVATION
Lagoons,
W79-07719 2L

Protecting Aquatic Life: What Can the Layman Do,
W79-07992 6E

PRIMARY PRODUCTIVITY
Response of Phytoplankton and Bacteria to Water Quality in the Chowan River, North Carolina,
W79-07568 5C

PROBABILITY
The San Francisco Bay Delta Wastewater and Residual Solids Management Study. Volume VI. Technical Appendix. The Public Health Implications of Land Application of Wastewater and Residual Solids,
W79-07869 5E

PRODUCTIVITY
Growth and Production of Amphipods Gammarus Olivii at Different Temperatures,
W79-07595 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume V - Appendices J - M,
W79-07929 5C

PROGRAMS
Plans for Water Data Acquisition by Federal Agencies Through Fiscal Year 1980,
W79-07704 6B

PROJECTS
Role of U.S. Geological Survey in Illinois,
W79-07711 7C

PROSERIATES
Adaptations to Sulfide in the Meiofauna of the Sulfide System. I. 35S-Sulfide Accumulation and the Presence of a Sulfide Detoxification System,
W79-07652 5B

PROTECTION
Protecting Aquatic Life: What Can the Layman Do,
W79-07992 6E

PROTOTYPE TESTS
Single-Valve Prototype Tests, Main Lock, Locks and Dam 26, Mississippi River, Alton, Illinois,
W79-07530 8A

PROTOZOA
Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume V - Appendices J - M,
W79-07929 5C

PSEUDODACTYLOGYRUS
Pseudodactylogyrus Microrchis (Monogenea) on the Gills of Cultured Eels-III Experimental Control by Trichlorfon,
W79-07593 5C

PSEUDOHAPLOGONARIA
Adaptations to Sulfide in the Meiofauna of the Sulfide System. I. 35S-Sulfide Accumulation and the Presence of a Sulfide Detoxification System,
W79-07652 5B

PSEUDOMONAS
Resistance of Bacterial Chemotaxis to Blockage in Petroleum Waters,
W79-07641 5C

PUBLIC HEALTH
Drinking Water and Health. Part I, Chapters 1-5. A Report of the Safe Drinking Water Committee,
W79-07590 5C

Drinking Water and Health Part 2, Chapters 6 and 7, A Report of the Safe Drinking Water Committee,
W79-07591 5C

The San Francisco Bay Delta Wastewater and Residual Solids Management Study. Volume VI. Technical Appendix. The Public Health Implications of Land Application of Wastewater and Residual Solids,
W79-07869 5E

PUBLIC RIGHTS
The Loss of Public Tidelands to Private Parties through Unconstitutional Land Trades,
W79-07911 6E

PUEBLO WATER RIGHTS
Pueblo Indian Water Rights: Who Will Get the Water,
W79-07912 6E

PULP AND PAPER INDUSTRY
Current Status and Directions of Development of Physico-Mechanical Effluent Treatment in the Paper Industry,
W79-07816 5D

PULP WASTES
Effect of pH on Toxicity of Kraft Pulp and Paper Mill Effluent to Salmonid Fish in Fresh and Seawater,
W79-07632 5C

Studies on the Toxicity of Pulp and Paper Factory Wastes to the Fish Notopterus Notopterus (Pallas),
W79-07659 5C

Dominance and Distribution of Benthic Macrophyte Assemblages in a North Florida Estuary (Apalachee Bay, Florida),
W79-07660 5C

Biomonitoring of Pulp and Paper Effluents,
W79-07983 5A

PUMP TESTING
Water System Basics - Troubleshooting for Jet Pumps,
W79-07738 8C

PUMPED STORAGE
Water Temperature Effects on Horizontal Buoyant Submerged Jets,
W79-07572 8B

Mixing in Rectangular Tanks using Horizontal Jets,
W79-07573 8B

A Numerical Simulation for a Pumped Storage Reservoir,
W79-07574 8B

Effect of Vertical Scale Distortion on the Temperature Field of a Thermal-Hydraulic Model,
W79-07575 8B

Pumped Storage Survey,
W79-07576 8B

PUMPS
Hackmatack Made Reliable Hand Pumps,
W79-07723 8C

PYRETHROIDS
Toxicity of Permethrin, Decamethrin, and Related Pyrethroids to Salmon and Lobster,
W79-07654 5C

QUALITY CONTROL
Developer's Handbook,
W79-07735 6B

RADIOACTIVE DATING
U.S. Geological Survey, Denver, Colorado, Radiocarbon Dates II,
W79-07707 2F

RADIOACTIVE WASTES
Ground-Water Hydrology and Subsurface Migration of Radioisotopes at a Low-Level Solid Radioactive-Waste Disposal Site, West Valley, New York,
W79-07713 5B

RAINBOW TROUT
Lethal and Sublethal Effects of Binary Mixtures of Cyanide and Hexavalent Chromium, Zinc, or Ammonia to the Fathead Minnow (Pimephales Promelas) and Rainbow Trout (Salmo Gairdneri),
W79-07610 5C

Temperature Selection and Estimated Thermal Acclimation by Rainbow Trout (Salmo Gairdneri) in a Thermal Plume,
W79-07629 5C

Modification of the Rheotropic Response of Rainbow Trout (Salmo Gairdneri) by Sublethal Doses of the Aquatic Herbicides Diquat and Simazine,
W79-07645 5C

RAINFALL
On the Influence of the Spatial Distribution of Rainfall on Storm Runoff,
W79-07765 2B

An Investigation into the Effect of Storm Type on Precipitation in a Small Mountain Watershed,
W79-07767 2B

RAINFALL-RUNOFF RELATIONSHIPS
Hydrologic Data for North Creek, Trinity River Basin, Texas, 1976,
W79-07698 2E

The Hydrological Response of Headwater and Sideslope Areas,
W79-07755 2E

Storm Runoff and Combined Sewers in Washington, D. C.,
W79-07986 5B

RANA
The Influence of Rearing Density on the Subsequent Response to DDT Dosing for Tadpoles of the Frog Rana Temporaria,
W79-07663 5C

RANKIN COUNTY (MISS)
Water for Municipal and Industrial Development in Hinds, Madison, and Rankin Counties, Mississippi,
W79-07944 7C

RECHARGE PONDS
Treatment of Primary Sewage Effluent by Rapid Infiltration,
W79-07792 5D

Changes in Vegetation Diversity Caused by Artificial Recharge,
W79-07951 4B

RECLAIMED WATER
Use of Storm-Water Basins for Artificial Recharge with Reclaimed Water, Nassau County, Long Island, New York--A Hydraulic Feasibility Study,
W79-07948 4B

RECLAMATION
Sludge Incineration Systems for Purification and Resource Recovery,
W79-07827 5E

Wastewater Treatment and Oil Reclamation at General Motors, St. Catherines,
W79-07855 5D

Acreage and Residency Limitations in the Imperial Valley: A Case Study in National Reclamation Policy,
W79-07902 6E

Proposed Rules for Administering the Acreage Limitation of Reclamation Law,
W79-07914 6E

RECREATION
Water-Based Activity Involvement for Recreation Consumers at State, Federal, Local, or Private Facilities,
W79-07580 6B

RECYCLING
Water Reuse and Recycling, Volume I: Evaluation of Needs and Potential,
W79-07501 6D

Feasibility Study of Waste Water Recovery in Shrimp Processing Plants,
W79-07794 5D

Wastewater Treatment and Oil Reclamation at General Motors, St. Catherines,
W79-07855 5D

Treatment and Recovery of Emulsified Oil by Ultrafiltration,
W79-07862 5D

RED TIDE
Comparison of Toxins in Three Isolates of Gonyaulax Tamarensis (Dinophyceae),
W79-07620 5A

REFRACTIVITY
An Index of Refractory Organics,
W79-07784 5A

REGIONAL ANALYSIS
Flood Plain Development Pressures and Federal Programs-Part 1-Case Study Analysis and Recommendations for the '201' Wastewater Treatment Works Program,
W79-07877 6E

REGIONAL EVAPOTRANSPIRATION
An Advection-Aridity Approach to Estimate Actual Regional Evapotranspiration,
W79-07548 2D

REGIONAL MODELS
Cost Analysis of Water and Waste Water Treatment Processes in Developing Countries,
W79-07999 6B

REGRESSION ANALYSIS
Choosing Among Alternative Hydrologic Regression Models,
W79-07763 2E

Exceedance Probability - Depth Relationships of Floods for Maryland Streams West of Chesapeake Bay,
W79-07941 2E

Technique for Estimating Magnitude and Frequency of Floods in Delaware,
W79-07942 6A

REGULATION
Developer's Handbook,
W79-07735 6B

Aspects of State-Wide Emergency Response Programs for Municipal Wastewater Treatment Facilities Program,
W79-07797 5G

The Role of the Ministry of the Environment in the Disposal of Liquid Industrial Waste in Ontario,
W79-07856 5D

Controlling PCB Discharges to the Environment,
W79-07857 5B

Diffuse Source Pollution: Policy Considerations for the States.
W79-07879 6E

Conservation Districts and 208 Water Quality Management-Nonpoint Source Identification and Assessment, Selection of Best Management Practices, Management Agencies, Regulatory Programs,
W79-07886 4A

Wetlands Related Legislation in the United States,
W79-07888 6E

Protecting Massachusetts Wetlands,
W79-07908 6E

Current Groundwater Law in Arizona,
W79-07909 6E

Federal Enforcement Proceedings under the 1977 Clean Water Act,
W79-07910 6E

Proposed Rules for Administering the Acreage Limitation of Reclamation Law,
W79-07914 6E

REHABILITATION
Opportunities for Maintenance Rehabilitation of Riparian Habitats: Eastern United States,
W79-07518 5C

REND LAKE (IL)
Nutrient Budget Analysis for Rend Lake in Illinois,
W79-07748 5A

REPRODUCTION
The Reproduction Behavior of Gammarus Duebeni (Lilljeborg), and the Inhibitory Effect of a Surface Active Agent,
W79-07672 5C

REPTILES
Organochlorine Insecticide Residues in Amphibians and Reptiles from Iowa and Lizards from the Southwestern United States,
W79-07667 5C

RESEARCH
Reservoirs and Waterways; Identification and Assessment of Environmental Quality Problems and Research Program Development,
W79-07522 5G

RESEARCH AND DEVELOPMENT
Future Research Needs,
W79-07517 6A

Ground Water Heat Pump Update,
W79-07640 8C

Research of the U. S. Fish and Wildlife Service,
W79-07976 9C

RESEARCH EQUIPMENT
A Portable Suction Dredge for Quantitative Sampling in Difficult Substrates,
W79-07678 5A

RESERVATION DOCTRINE
Federal Reserved Water Rights Since PLLRC,
W79-07875 6E

Cappaert V. United States: A Dehydration of Private Groundwater Use,
W79-07904 6E

Pueblo Indian Water Rights: Who Will Get the Water,
W79-07912 6E

RESERVOIR MANAGEMENT
Analysis of Economic Effects of Water Surface Elevations on U.S. Shoreline of Lake Champlain, New York and Vermont,
W79-07744 6B

RESERVOIR OPERATION
A Reservoir Operating Model with Inorganic Quality Constraints for the Truckee River,
W79-07562 4A

A Numerical Simulation for a Pumped Storage Reservoir,
W79-07574 8B

RESERVOIRS
Reservoirs and Waterways; Identification and Assessment of Environmental Quality Problems and Research Program Development,
W79-07522 5G

Collie River Underflow into the Wellington Reservoir,
W79-07552 2E

RESOURCES DEVELOPMENT
Federal Role in OCS Oil and Gas Development.
W79-07931 5C

Study Design for Resource Management Decisions: OCS Oil and Gas Development and the Environment.
W79-07932 5C

The Microfouling Problem and the Future of the Ocean Thermal Energy Conversion (OTEC) Program,
W79-07933 5C

OCS Development and Commercial and Recreational Fishing,
W79-07934 5C

RETAINING WALLS
Hydrologic Data for North Creek, Trinity River Basin, Texas, 1976,
W79-07698 2E

RETURN FLOW
Treatment of Primary Sewage Effluent by Rapid Infiltration,
W79-07792 5D

Securing Agricultural Land for Wastewater Irrigation,
W79-07796 3C

REVERSE OSMOSIS
High Flux PBI Reverse Osmosis Membranes for Desalination and Water Reuse,
W79-07571 3A

RHEOTROPISM
Modification of the Rheotropic Response of Rainbow Trout (Salmo Gairdneri) by Sublethal Doses of the Aquatic Herbicides Diquat and Simazine,
W79-07645 5C

RIFFLES
Rhythmic Spacing and Origin of Pools and Riffles,
W79-07566 4A

RIPARIAN WATERS
Opportunities for Maintenance Rehabilitation of Riparian Habitats: Eastern United States,
W79-07518 5C

RIVER BASIN
Levels of Analysis in Comprehensive River Basin Planning,
W79-07577 6B

RIVER BASIN DEVELOPMENT
Future Research Needs,
W79-07517 6A

RIVER BASINS
Water Resources of the Waccasassa River Basin and Adjacent Areas, Florida,
W79-07712 7C

RIVER REGULATION
Water Way Preservation: The Wild and Scenic Rivers Act of 1968,
W79-07895 6E

RIVERS
Inertia and Elasticity as a Stream Classification System: Youghiogheny River Case History Evaluation,
W79-07508 5C

Drainage Evolution and Fish Dispersal in the Central Appalachians: Summary,
W79-07510 2E

Collie River Underflow into the Wellington Reservoir,
W79-07552 2E

Sediment Loads in the Amazon River,
W79-07710 2J

Water Way Preservation: The Wild and Scenic Rivers Act of 1968,
W79-07895 6E

RNA
Effect of High Concentrations of Petroleum and Phenol on the Metabolism of Nucleic Acids of Algae Macrophytes,
W79-07599 5C

ROOTED AQUATIC PLANTS
Nutrient Dynamics of Freshwater Riverine Marshes and the Role of Emergent Macrophytes,
W79-07734 2K

Rooted Aquatic Plants,
W79-07965 5A

ROUGHNESS (HYDRAULIC)
An Estimate of Channel Roughness of Interoceanic Canals,
W79-07529 8B

RUNOFF
Simulation of Arid Rangeland Watershed Hydrology with the USDAHL-74 Model,
W79-07557 2A

Hydrologic Effects of Brush Control on Texas Rangelands,
W79-07558 2A

On the Influence of the Spatial Distribution of Rainfall on Storm Runoff,
W79-07765 2B

Sediment Transport by Irrigation Return Flows, on the Yakima Indian Reservation, Washington 1975 and 1976 Irrigation Seasons,
W79-07953 2J

RUNOFF FORECASTING
'Arima' Processes for Hydrometeorological Forecasting and Simulation (Les Processus du Type 'Arima' pour la Prevision et la Simulation en Hydrometeorologie),
W79-07583 2A

RURAL AREAS
New Ontario Policy for Low Cost Alternatives to Communal Water and Sewage Treatment,
W79-07843 6E

RURAL TOWNS
A Water Resource Planning Procedure for Rural Towns,
W79-07561 6A

SACCOBRANCHUS
In Vivo Effect on ATPase in Certain Tissues of Labeo Rohita and Saccobranchus Fossilis, Following Chronic Chlordane Intoxication,
W79-07674 5C

SAFE DRINKING WATER ACT
Impact of the Law Regulating Drinking Water on Water Resources Management,
W79-07716 6E

SALINE WATER INTRUSION
Hydrochemical Evidence of Sea Water Intrusion Along the Mangrol-Chorwad Coast of Saurashtra, Gujarat,
W79-07752 2L

Mathematical Modelling of a Well Field, Chatham, N. B.,
W79-07961 2F

SALINITY
Interactive Effects of Salinity, Temperature and Chronic Exposure to Oil on the Survival and Developmental Rate of Embryos of the Estuarine Killifish Fundulus Heteroclitus,
W79-07635 5C

Calanoid Copepod Eggs in Sea-Bottom Muds. IV. Effects of Some Environmental Factors on the Hatching of Resting Eggs,
W79-07642 5B

Distribution of Chaetognaths Along the Salinity Gradient in the Cochin Backwater, an Estuary Connected to the Arabian Sea,
W79-07675 5C

Plankton of the Hooghly Estuary with Special Reference to Salinity and Temperature,
W79-07693 5C

SALMONELLA
Induction of Benzo (a) Pyrene Monooxygenase in Fish and the Salmonella Test as a Tool for Detecting Mutagenic/Carcinogenic Xenobiotics in the Aquatic Environment,
W79-07669 5C

SALT MARSHES
The Coastline,
W79-07718 2L

Salt-Marshes,
W79-07721 2L

SALT RIVER
The Application of Aerial and Satellite Snow-Mapping Techniques for Multi-Purpose Reservoir System Operations in Arizona,
W79-07695 7B

SAMPLING
A Portable Suction Dredge for Quantitative Sampling in Difficult Substrates,
W79-07678 5A

Arsenic Contamination of Ground Water in the Maritimes,
W79-07960 5A

The Distribution of Trace Metals in the Wilderness Lakes,
W79-07994 5A

SAN ANTONIO AREA
Records of Ground-Water Recharge and Discharge for the Edwards Aquifer in the San Antonio Area, Texas, 1934-77,
W79-07949 2F

SAND AQUIFERS
Variations in Specific Yield in the Outcrop of the Carrizo Sand in South Texas as Estimated by Seismic Refraction,
W79-07750 2F

SANDS
A Computer Simulation of Soil Water Distribution Using the Pulsed Drip Irrigation Method at Low and High Discharge Rates on a Sandy Soil,
W79-07995 3F

SATELLITES (ARTIFICIAL)
The Application of Aerial and Satellite Snow-Mapping Techniques for Multi-Purpose Reservoir System Operations in Arizona,
W79-07695 7B

SATURATION
Capillary Pressure-Saturation Relationships for a Forest Soil,
W79-07542 2G

SAXTOXIN
Comparison of Toxins in Three Isolates of Gonyaulax Tamarensis (Dinophyceae),
W79-07620 5A

SCENEDESMUS
Bioconcentration of Chlordane by the Green Alga Scenedesmus Quadricauda,
W79-07625 5C

SCREENS
Thickening and Dewatering of Waste Water Sludges by Vibro Filtration Method,
W79-07832 5E

Screening/Flotation Treatment of Combined Sewer Overflows. Volume I - Bench Scale and Pilot Plant Investigations,
W79-07867 5D

SEA URCHINS
Expansion of a Central California Kelp Forest Following the Mass Mortality of Sea Urchins,
W79-07601 5B

SEA WATER
The Microfouling Problem and the Future of the Ocean Thermal Energy Conversion (OTEC) Program,
W79-07933 5C

SEAGRASSES
Habitat Development Field Investigations, Port St. Joe Seagrass Demonstration Site, Port St. Joe, Florida; Summary Report,
W79-07531 5E

SEASONAL
Observations on the Environmental Characteristics of Pulicat Lake,
W79-07694 5B

SEAWEED
Trends in Applied Phycology with a Literature Review: Seaweed Farming on an Industrial Site,
W79-07619 5B

SEDIMENT CONTROL
Sediment Traps in Channels--Design Procedures and Performance,
W79-07804 2J

SEDIMENT RESUSPENSION
The Transport and Resuspension of Sediments in a Shallow Lake,
W79-07541 2H

SEDIMENT TRANSPORT
Compartmented Sediment Trap,
W79-07538 2J

The Transport and Resuspension of Sediments in a Shallow Lake,
W79-07541 2H

Sediment Loads in the Amazon River,
W79-07710 2J

Sediment Transport by Irrigation Return Flows, on the Yakima Indian Reservation, Washington 1975 and 1976 Irrigation Seasons,
W79-07953 2J

SEDIMENT YIELD
Discrete Dynamic Model of Watershed Sediment Yield,
W79-07539 2J

Sediment Loads in the Amazon River,
W79-07710 2J

Sediment Transport by Irrigation Return Flows, on the Yakima Indian Reservation, Washington 1975 and 1976 Irrigation Seasons,
W79-07953 2J

SEDIMENTATION
Model for Suspended Sediment Transport,
W79-07537 2J

The Survival of Human Enteric Viruses in Holding Ponds,
W79-07790 5D

Waste Water Treatment by Physical and Mechanical Methods,
W79-07813 5D

Improvement of Hydraulic Conditions of Radial Settling Tanks,
W79-07815 5D

Current Status and Directions of Development of Physico-Mechanical Effluent Treatment in the Paper Industry,
W79-07816 5D

The Swirl Concentrator for Treating and Regulating Sewered (Separate and Combined) and Unsewered Flows,
W79-07823 5D

The Changing Molluscan Community,
W79-07981 5C

SEDIMENTS
Monitoring Spawning Gravel in Managed Forested Watersheds, A Proposed Procedure,
W79-07503 5C

Aquatic Disposal Field Investigations Ashtabula River Disposal Site, Ohio, Appendix C, Investigation of Water-Quality and Sediment Parameters,
W79-07525 5C

Identification of Suspended Sediment Sources by Means of Magnetic Measurements: Some Preliminary Results,
W79-07533 5B

Compartmented Sediment Trap,
W79-07538 2J

Flow Resistance in Cobble and Boulder Riverbeds,
W79-07550 2E

Distribution and Fractionation of Arsenic in Selected Fresh Water Lake Sediments,
W79-07689 5A

Completion of Shelled Microzoobenthon Samples,
W79-07915 5C

The Distribution of Trace Metals in the Wilderness Lakes,
W79-07994 5A

SEDIMENTS CONTROL
Controlling Sediment Damage,
W79-07990 4D

SEEPAGE
An Isotopic Study of Groundwater Seepage in the Central Kentucky Karst,
W79-07757 2F

SEISMIC STUDIES
Variations in Specific Yield in the Outcrop of the Carrizo Sand in South Texas as Estimated by Seismic Refraction,
W79-07750 2F

SEPARATION TECHNIQUES
The Survival of Human Enteric Viruses in Holding Ponds,
W79-07790 5D

The Swirl Concentrator for Treating and Regulating Sewered (Separate and Combined) and Unsewered Flows,
W79-07823 5D

Modern State and Principal Trends in Technology Development for Wastewater Sludge Treatment,
W79-07829 5E

Thickening and Dewatering of Waste Water Sludges by Vibro Filtration Method,
W79-07832 5E

Dewatering of Sewage Sludge by Means of Centrifuges,
W79-07835 5E

Proceedings of the 23rd Ontario Industrial Waste Conference.
W79-07849 5D

The Control of Hydrogen Sulphide Emissions at Ontario Hydro's Bruce Heavy Water Plant,
W79-07851 5D

Solid Liquid Separation Utilizing an Inclined Plate Separator and Filter Press,
W79-07852 5D

Treatment and Recovery of Emulsified Oil by Ultrafiltration,
W79-07862 5D

SEPTIC TANKS
Management of Small Waste Flows.
W79-07774 5D

New Ontario Policy for Low Cost Alternatives to Communal Water and Sewage Treatment,
W79-07843 6E

SETTLING BASINS
Improvement of Hydraulic Conditions of Radial Settling Tanks,
W79-07815 5D

York Region's Operational Experience with Tertiary Treatment,
W79-07844 5D

SEWAGE
Treatment of Primary Sewage Effluent by Rapid Infiltration,
W79-07792 5D

SEWAGE BACTERIA
Effect of Upgrading a Municipal Wastewater Effluent on Pollution Indicator and other Microorganisms in River Water,
W79-07633 5C

Application of Oxygen to Treat Waste from Military Field Installations, Part I. Inactivation of Virus in Bench-Scale Oxygenated Waste Stabilization Ponds,
W79-07809 5D

SEWAGE DISPOSAL
Proceedings of the 23rd Ontario Industrial Waste Conference.
W79-07849 5D

SEWAGE EFFLUENT
Nitrogen and Phosphorus Removal from Sewage Effluent with High Salinity by Chorella Salina,
W79-07643 5D

SEWAGE EFFLUENTS
Dieldrin Pollution in the River Holme Catchment, Yorkshire,
W79-07604 5C

Impact of Wastewater Treatment Plant Discharges,
W79-07985 5C

SEWAGE OVERFLOW
Optimum Alternatives for Controlling Combined Sewage Overflows--A Case Study,
W79-07997 6B

SEWAGE SLUDGE
Growth Dynamics of Cordgrass, Spartina Alterniflora, Loisel., on Control and Sewage Sludge Fertilized Plots in a Georgia Salt Marsh,
W79-07681 5C

On-Land Disposal of Municipal Sewage Sludge: A Guide to Project Development (Interim Report),

Utilization of Municipal Sludge in Agriculture,
W79-07840 5E

Operational Experience with the Zimpro Low-Pressure Wet Air Oxidation Process,
W79-07845 5E

SEWAGE SYSTEMS
Optimum Alternatives for Controlling Combined Sewage Overflows--A Case Study,
W79-07997 6B

SEWAGE TREATMENT
Effect of Upgrading a Municipal Wastewater Effluent on Pollution Indicator and other Microorganisms in River Water,
W79-07633 5C

Proceedings of the Seminar on Current Approaches in Wastewater Treatment.
W79-07842 5D

Flood Plain Development Pressures and Federal Programs-Part 1-Case Study Analysis and Recommendations for the '201' Wastewater Treatment Works Program,
W79-07877 6E

SEWERAGE
USA-USSR Working Group on the Prevention of Water Pollution from Municipal and Industrial Sources Symposium on Physical-Mechanical Treatment of Wastewaters, Held at Cincinnati, Ohio on April 5-6, 1977,
W79-07811 5D

Sewage Treatment of the City of Moscow,
W79-07824 5D

Storm Runoff and Combined Sewers in Washington, D. C.,
W79-07986 5B

SHALLOW WELLS
Innovations Simplify Shallow Well Monitoring,
W79-07761 7B

SHIPS
Shipboard Evaluation of a Carlson Mark 10 Chlorinator/Macerator Sanitary Waste-Water Treatment System,
W79-07801 5D

SHORE PROTECTION
Volume III. The Wetlands/Edges Program. Research on the Chesapeake Bay to Provide a Knowledge Base for Physical Alterations of the Edges of the Chesapeake Bay,
W79-07724 6G

Harbor Lines and the Public Trust Doctrine in Washington Navigable Waters,
W79-07897 4C

SHORES
The Coastline,
W79-07717 2L

Muddy Foreshores,
W79-07720 2L

SHRIMP
Effects of Temperature on the Median Tolerance Limit of Pink Salmon and Shrimp Exposed to Toluene, Naphthalene, and Cook Inlet Crude Oil,
W79-07637 5C

Distribution of Mirex in an Experimental Estuarine Ecosystem,
W79-07682 5C

SIDESLOPE AREAS
The Hydrological Response of Headwater and Sideslope Areas,
W79-07755 2E

SILTING
Completion of Shelled Microzoobenthon Samples,
W79-07915 5C

SIMAZINE
Modification of the Rheotropic Response of Rainbow Trout (Salmo Gairdneri) by Sublethal Doses of the Aquatic Herbicides Diquat and Simazine,
W79-07645 5C

SIMULATION ANALYSIS
A Reservoir Operating Model with Inorganic Quality Constraints for the Truckee River,
W79-07562 4A

Reducing the Cost of Continuous Hydrologic-Hydraulic Simulation,
W79-07998 2A

SITES
Completion of Shelled Microzoobenthon Samples,
W79-07915 5C

SKIN NECROSIS
Elemental Distribution in Relation to Skin Necroses of Marine Flatfishes from the English Channel,
W79-07597 5C

SLUDGE
Inorganic Suspended Sludge Dewatering,
W79-07834 5E

The Dependence of Dewatering Process on Aqueous Properties of Sludges,
W79-07841 1A

SLUDGE DIGESTION
Municipal Sludge Management Research Program in the U.S.A.,
W79-07833 5E

SLUDGE DISPOSAL
Cost of Landspreading and Hauling Sludge from Municipal Wastewater Treatment Plants. Case Studies,
W79-07777 5E

On-Land Disposal of Municipal Sewage Sludge: A Guide to Project Development (Interim Report),
W79-07780 5E

Pyrolysis Applications for Industrial and Municipal Treatment,

SOIL TYPES
An Introduction to Wisconsin Wetlands - Plants, Hydrology, and Soils,
W79-07706 2G

Final Report on Fate of Metals Applied in Sewage at Land Wastewater Disposal Sites,
W79-07789 5B

SOIL WATER
Simulation of Arid Rangeland Watershed Hydrology with the USDAHL-74 Model,
W79-07557 2A

Universal Constants for Scaling the Exponential Soil Water Diffusivity,
W79-07754 2G

SOIL WATER MOVEMENT
Air and Water Movement in Porous Media: Compressibility Effects,
W79-07544 2G

SOIL-WATER-PLANT RELATIONSHIPS
An Introduction to Wisconsin Wetlands - Plants, Hydrology, and Soils,
W79-07706 2G

SOILS
Wind Profile Parameters and Turbulence Intensity over Several Roughness Element Geometries,
W79-07547 2D

SOLEA
Elemental Distribution in Relation to Skin Necroses of Marine Flatfishes from the English Channel,
W79-07597 5C

SOLENOFILOMORPHA
Adaptations to Sulfide in the Meiofauna of the Sulfide System. I. 35S-Sulfide Accumulation and the Presence of a Sulfide Detoxification System,
W79-07652 5B

SOLID WASTES
Ground-Water Hydrology and Subsurface Migration of Radioisotopes at a Low-Level Solid Radioactive-Waste Disposal Site, West Valley, New York,
W79-07713 5B

SOLUTES
Drinking Water and Health. Part I, Chapters 1-5. A Report of the Safe Drinking Water Committee,
W79-07590 5C

SOUTH DAKOTA
A Geohydrologic Overview for the Pecora Symposium Field Trip, June 1979,
W79-07699 2A

SOUTHEAST
The North Carolina Coastal Zone and Its Environment, Volume II. A Compilation of Resource Materials Covering the Coastal Plain, Estuaries, and Offshore Waters,
W79-07740 10C

SOUTHWEST U.S.
Hydrologic Effects of Brush Control on Texas Rangelands,
W79-07558 2A

SPARTINA
Growth Dynamics of Cordgrass, Spartina Alterniflora, Loisel., on Control and Sewage Sludge Fertilized Plots in a Georgia Salt Marsh,
W79-07681 5C

SPATIAL DISTRIBUTION
Determination of Average Dry Weights of Important Neuston Species Collected in 1976,
W79-07917 5C

SPAWNING
Monitoring Spawning Gravel in Managed Forested Watersheds, A Proposed Procedure,
W79-07503 5C

Effects of Spring Water Levels on the Reproduction of Upper Richelieu and Missisquoi Bay: Northern Pike (Esox Lucius L.),
W79-07742 2I

The Fishery of the Piedmont Potomac,
W79-07972 5C

SPECIES DIVERSITY
Dominance and Distribution of Benthic Macrophyte Assemblages in a North Florida Estuary (Apalachee Bay, Florida),
W79-07660 5C

SPECTROPHOTOMETRY
Development of a Chelating/Co-Precipitation Procedure for Matrix-Free Analysis of Various Metals in Organisms from the South Texas OCS by Atomic Absorption Spectrophotometry,
W79-07925 5A

SPRING WATERS
Springs of Florida,
W79-07946 1A

SPRINGS
Map Showing General Quality of Ground Water in the Kaiparowits Coal-Basin Area, Utah,
W79-07937 2K

Springs of Florida,
W79-07946 1A

SPRINGS INVENTORY
Springs of Florida,
W79-07946 1A

SPRINKLER IRRIGATION
Evaluation of Crop Water Stress under Limited Irrigation,
W79-07892 2I

STABILIZATION
Aerobic Stabilization of Activated Sludge,
W79-07837 5E

STANDARDS
The Economic Impact of Alternative Cyanide Standards in Illinois,
W79-07885 6E

STAPHYLOCOCCUS
Experimental Degradation of Crude Oil by Marine Bacteria,
W79-07594 5B

STATE GOVERNMENTS
Land Application of Wastewater and State Water Law: State Analyses Volume II,
W79-07876 6E

STATISTICAL METHODS
A Statistical View of a Class of Water Quality Indices,
W79-07708 1A

STATISTICS
Annual Precipitation in the Northeast United States: Long Memory, Short Memory, or No Memory,
W79-07555 2B

STOCHASTIC PROCESSES
'Arima' Processes for Hydrometeorological Forecasting and Simulation (Les Processus du Type 'Arima' pour la Prevision et la Simulation en Hydrometeorologie),
W79-07583 2A

STORM RUNOFF
Use of Specific Conductance and Contact Time Relations for Separating Flow Components in Storm Runoff,
W79-07764 2B

On the Influence of the Spatial Distribution of Rainfall on Storm Runoff,
W79-07765 2B

Use of Storm-Water Basins for Artificial Recharge with Reclaimed Water, Nassau County, Long Island, New York--A Hydraulic Feasibility Study,
W79-07948 4B

STORMS
An Investigation into the Effect of Storm Type on Precipitation in a Small Mountain Watershed,
W79-07767 2B

STRATIFICATION
Water Temperature Effects on Horizontal Buoyant Submerged Jets,
W79-07572 8B

Mixing in Rectangular Tanks using Horizontal Jets,
W79-07573 8B

A Numerical Simulation for a Pumped Storage Reservoir,
W79-07574 8B

Effect of Vertical Scale Distortion on the Temperature Field of a Thermal-Hydraulic Model,
W79-07575 8B

Pumped Storage Survey,
W79-07576 8B

Effects of a Barrier on Temperature Structure and Mixing in Thermally Stratified Water Cooled from Above,

Hydrology of the Beaver Valley Area, Beaver County, Utah, with Emphasis on Ground Water,
W79-07945 7C

Land Use Influences on Metals in Storm Drainage,
W79-07954 5B

SURFACTANTS
Correlations between Daphnia Magna and Fathead Minnow (Pimephales Promelas) Chronic Toxicity Values for Several Classes of Test Substances,
W79-07603 5A

The Reproduction Behavior of Gammarus Duebeni (Lilljeborg), and the Inhibitory Effect of a Surface Active Agent,
W79-07672 5C

SURGES
Periodic Surging of the Antarctic Ice Sheet--An Assessment by Modeling,
W79-07751 2C

SURPLUS LAND HOLDINGS
Impact of the Law Regulating Drinking Water on Water Resources Management,
W79-07716 6E

SURVEYS
Existing State and Local Wetland Surveys (1965-1975). Volume II: Narrative,
W79-07726 7B

SURVIVAL
Acute Toxicity of Platinum to Coho Salmon (Oncorhynchus Kisutch),
W79-07644 5C

SUSPENDED LOAD
Effects of Suspended Dredged Material on Aquatic Animals,
W79-07523 5E

Sediment Loads in the Amazon River,
W79-07710 2J

SUSPENDED SOLIDS
Identification of Suspended Sediment Sources by Means of Magnetic Measurements: Some Preliminary Results,
W79-07533 5B

Drinking Water and Health. Part I, Chapters 1-5. A Report of the Safe Drinking Water Committee,
W79-07590 5C

The Effect of Polyacrylamide Molecular Structure on Flocculation Activity of Domestic Sewage,
W79-07805 5D

Application of Oxygen to Treat Waste from Military Field Installations, Part I. Inactivation of Virus in Bench-Scale Oxygenated Waste Stabilization Ponds,
W79-07809 5D

Employment of Microstrainers in the Waste Water Treatment Practice,
W79-07817 5D

Performance Tests on Full-Scale Tertiary Granular Media Filters,
W79-07821 5D

The Swirl Concentrator for Treating and Regulating Sewered (Separate and Combined) and Unsewered Flows,
W79-07823 5D

SWAMP
Nutrient Relationships in the Detritus of a Tropical Swamp,
W79-07736 2K

TADPOLES
The Influence of Rearing Density on the Subsequent Response to DDT Dosing for Tadpoles of the Frog Rana Temporaria,
W79-07663 5C

TAILWATER
Harvesting Runoff from Precipitation on Irrigated Lands,
W79-07890 3F

TEMPERATURE
Survival of Euglena Gracilis Exposed to Sublethal Temperature and Hexavalent Chromium,
W79-07770 5C

TEMPORAL DISTRIBUTION
Determination of Average Dry Weights of Important Neuston Species Collected in 1976,
W79-07917 5C

TERATOGENS
Studies on Intraperitoneal Toxicity of Lead to Cichlasoma Nigrofasciatum (Guenther) Development,
W79-07617 5C

TERRESTRIAL HABITATS
Handbook for Terrestrial Wildlife Habitat Development of Dredged Material,
W79-07527 5E

TERTIARY TREATMENT
Sewage Treatment of the City of Moscow,
W79-07824 5D

Proceedings of the Seminar on Current Approaches in Wastewater Treatment.
W79-07842 5D

York Region's Operational Experience with Tertiary Treatment,
W79-07844 5D

TEXAS
Hydrologic Effects of Brush Control on Texas Rangelands,
W79-07558 2A

Variations in Specific Yield in the Outcrop of the Carrizo Sand in South Texas as Estimated by Seismic Refraction,
W79-07750 2F

Completion of Shelled Microzoobenthon Samples,
W79-07915 5C

Analyses of 1975-76 Microzooplankton Samples from Transect II,
W79-07916 5G

Determination of Average Dry Weights of Important Neuston Species Collected in 1976,
W79-07917 5C

Bureau of Land Management South Texas Outer Continental Shelf Report of Consultancy on Benthic Ecology Programme - 22 August - 11 September and 24 October - 5 November,
W79-07918 5C

Macroinvertebrate Study,
W79-07919 5C

Biomass Measurements of Benthic Invertebrates,
W79-07920 5C

Addendum to Histopathology of Demersal Fishes. Histopathology of Micropogon Undulatus (Atlantic Croaker) Exposed to Water Soluble Fractions of South Louisiana Crude Oil,
W79-07921 5C

An Intensive Study of the Heavy Hydrocarbons in the Suspended Particulate Matter of Seawater,
W79-07922 5B

Fate of Petroleum-Derived Aromatic Compounds in Seawater Held in Outdoor Tanks,
W79-07923 5C

Development of Mini-Computer Programming to Aid in Interpretation of Mass Spectral Data,
W79-07924 5A

Development of a Chelating/Co-Precipitation Procedure for Matrix-Free Analysis of Various Metals in Organisms from the South Texas OCS by Atomic Absorption Spectrophotometry,
W79-07925 5A

Biological Characterization of the Nepheloid Layer,
W79-07926 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume III - Appendices A-F.

Toxicity of Cadmium Chloride and Lead Nitrate to Chironomus Tentans Larvae,
W79-07606 5C

Chronic Lead Poisoning in a Herd of Mute Swans,
W79-07608 5C

Metal Contents of the Two Marine Algae Found on Iron Ore Tailings,
W79-07609 5B

Effect of Phenobarbital and Hexobarbital Treatment on Lepidocephalichthys Thermalis, A Fresh Water Fish,
W79-07611 5C

Relation between Toxicity and Accumulation of Various Chlorophenols in Goldfish,
W79-07614 5B

Requirement of Red Sea Bream for Dietary Mg,
W79-07615 5C

Chemical Contamination by PCBs in the Fishes of a French River: The Furans (Jura),
W79-07618 5C

Changes in Phytoplankton Physiology and Morphology in Response to Dissolved Nutrients in Lough Neagh, N. Ireland,
W79-07621 5A

Toxicity and Bioaccumulation of Hexachlorocylopentadiene Hexachloronorbornadiene and Heptachloronorbornene in Larval and Early Juvenile Fathead Minnows, Pimephales Promelas,
W79-07622 5C

Remobilization of Sediment-Associated PCBs by the Worm Nereis Diversicolor,
W79-07623 5C

Organophosphate Poisoning to Some Fresh Water Teleosts - Acetylcholinesterase Inhibition,
W79-07626 5C

Vessel-Related Contamination of Southern California Harbours by Copper and Other Metals,
W79-07628 5C

PCBs and Organochlorine Insecticides in Oysters from Coastal Lagoons of the Gulf of Mexico, Mexico,
W79-07630 5C

Effects of Various Temperature Cycles on the Larval Development of the Gastropod Mollusc Crepidula Fornicata,
W79-07634 5C

Residual Heavy Metal Removal by an Algae-Intermittent Sand Filtration System,
W79-07638 5C

Acute Toxicity of Platinum to Coho Salmon (Oncorhynchus Kisutch),
W79-07644 5C

Modification of the Rheotropic Response of Rainbow Trout (Salmo Gairdneri) by Sublethal Doses of the Aquatic Herbicides Diquat and Simazine,
W79-07645 5C

Uptake and Loss of Zinc and Lead by Mussels (Mytilus Edulis) and Relationships with Body Weight and Reproductive Cycle,
W79-07646 5C

Strontium, Calcium and Magnesium Contents of Some Marine Algae from the West Coast of India,
W79-07648 5C

The Effect of Temperature on Growth, Physiology, and Gametogenesis in the Manila Clam Tapes Philippinarum (Adams & Reeve, 1850),
W79-07650 5C

Adaptations to Sulfide in the Meiofauna of the Sulfide System. I. 35S-Sulfide Accumulation and the Presence of a Sulfide Detoxification System,
W79-07652 5B

Mercury Accumulation in Ipomoea Aquatica (Forsk) Near a Caustic Soda Factory in Thailand,
W79-07653 5C

Alkanes in Plankton from the Buccaneer Oilfield,
W79-07655 5C

The Influence of Rearing Density on the Subsequent Response to DDT Dosing for Tadpoles of the Frog Rana Temporaria,
W79-07663 5C

Oxygen Consumption in Lepomis Machrochirus Exposed to 2,4-D or 2,4,5-T,
W79-07664 5C

Organochlorine Insecticide Residues in Amphibians and Reptiles from Iowa and Lizards from the Southwestern United States,
W79-07667 5C

Induction of Benzo (a) Pyrene Monooxygenase in Fish and the Salmonella Test as a Tool for Detecting Mutagenic/Carcinogenic Xenobiotics in the Aquatic Environment,
W79-07669 5C

Schema of Lethal Action of Copper on Mussels,
W79-07670 5C

In Vivo Effect on ATPase in Certain Tissues of Labeo Rohita and Saccobranchus Fossilis, Following Chronic Chlordane Intoxication,
W79-07674 5C

Kepone: Toxicity and Bioaccumulation in Blue Crabs,
W79-07679 5C

Distribution of Mirex in an Experimental Estuarine Ecosystem,
W79-07682 5C

The Effects of Temperature and Different Food Organisms on the Rate of Gastric Evacuation in Perch (Perca Fluviatilis),
W79-07683 5C

The Distribution of Heavy Metals in the Hard Clam, Mercenaria Mercenaria, in the Lower Chesapeake Bay Region,
W79-07685 5B

Cadmium Sorption in Estuarine Mud-Type Sediment and the Accumulation of Cadmium in the Soft-Shell Clam, Mya Arenaria,
W79-07691 5C

TOLUENE

Effects of Temperature on the Median Tolerance Limit of Pink Salmon and Shrimp Exposed to Toluene, Naphthalene, and Cook Inlet Crude Oil,
W79-07637 5C

TOXICITY

Report on Toxic/Hazardous Organic Compounds in the Wabash River Basin,
W79-07511 5B

Methylmercury: Reproductive and Behavioral Effects on Three Generations of Mallard Ducks,
W79-07598 5C

Effect of High Concentrations of Petroleum and Phenol on the Metabolism of Nucleic Acids of Algae Macrophytes,
W79-07599 5C

Toxicity of Cadmium Chloride and Lead Nitrate to Chironomus Tentans Larvae,
W79-07606 5C

Effect of Methamidophos on the Growth Rate and Esterase Activity of the Common Carp Cyprinus Carpio L.
W79-07607 5C

Chronic Lead Poisoning in a Herd of Mute Swans,
W79-07608 5C

Lethal and Sublethal Effects of Binary Mixtures of Cyanide and Hexavalent Chromium, Zinc, or Ammonia to the Fathead Minnow (Pimephales Promelas) and Rainbow Trout (Salmo Gairdneri),
W79-07610 5C

The Effects of Hydrogen Cyanide on Asellus Communis and Gammarus Pseudolimnaeus and Changes in their Competitive Response when Exposed Simultaneously,
W79-07612 5C

Relation between Toxicity and Accumulation of Various Chlorophenols in Goldfish,
W79-07614 5B

Studies on Intraperitoneal Toxicity of Lead to Cichlasoma Nigrofasciatum (Guenther) Development,

Natural Resources of Coastal Wetlands in Northern Santa Barbara County,
W79-07728 2L

SAN DIEGO UNIV., CA. ENVIRONMENTAL STUDIES CENTER.
The Natural Resources of Agua Hedionda Lagoon. Report Number 16 on California Coastal Wetlands,
W79-07731 2H

SASKATCHEWAN UNIV., SASKATOON. DEPT. OF BIOLOGY.
Environmental Disturbance and Life Histories: Principles and Examples,
W79-07636 5C

SASKATCHEWAN UNIV., SASKATOON. DEPT. OF SOIL SCIENCE.
Distribution and Fractionation of Arsenic in Selected Fresh Water Lake Sediments,
W79-07689 5A

SCIENCE AND EDUCATION ADMINISTRATION, BOISE, ID. NORTHWEST WATERSHED CENTER.
Simulation of Arid Rangeland Watershed Hydrology with the USDAHL-74 Model,
W79-07557 2A

SCIENCE AND EDUCATION ADMINISTRATION, BOISE, ID. NORTHWEST WATERSHED RESEARCH CENTER.
Application of an Infiltrometer System for Describing Infiltration into Soils,
W79-07543 2G

SCIENCE AND EDUCATION ADMINISTRATION, FORT COLLINS, CO.
A Monte Carlo Analysis of the Hydrologic Effects of Spatial Variability of Infiltration,
W79-07760 2G

SCIENCE AND EDUCATION ADMINISTRATION, FORT COLLINS, CO. AGRICULTURAL RESEARCH.
Evaluation of Crop Water Stress under Limited Irrigation,
W79-07892 2I

SCIENCE AND EDUCATION ADMINISTRATION, GRAND JUNCTION, CO.
Evapotranspiration Computed to Estimate Leaching Fractions,
W79-07546 2D

SCIENCE AND EDUCATION ADMINISTRATION, KIMBERLY, ID. SNAKE RIVER CONSERVATION RESEARCH CENTER.
Electronic Timers for Automated Surface Irrigation Systems,
W79-07989 3F

SCIENCE AND EDUCATION ADMINISTRATION, MANHATTAN, KS.
Wind Profile Parameters and Turbulence Intensity over Several Roughness Element Geometries,
W79-07547 2D

SCIENCE AND EDUCATION ADMINISTRATION, PHOENIX, AZ. WATER CONSERVATION LAB.
Level-Basin Irrigation: A Method for Conserving Water and Labor,
W79-07506 3F

SCIENCE AND EDUCATION ADMINISTRATION, ST. PAUL, MN. NORTH CENTRAL REGION.
The Agricultural Value of Dredged Material,
W79-07521 5E

SCIENCE AND EDUCATION ADMINISTRATION, TEMPLE, TX.
Hydrologic Effects of Brush Control on Texas Rangelands,
W79-07558 2A

SCOTTISH RESEARCH REACTOR CENTRE, EAST KILBRIDE.
An Isotopic Study of Groundwater Seepage in the Central Kentucky Karst,
W79-07757 2F

SEATTLE PACIFIC UNIV., WA.
Habitat Development Field Investigations, Port St. Joe Seagrass Demonstration Site, Port St. Joe, Florida; Summary Report,
W79-07531 5E

SOIL CONSERVATION SERVICE, EAST LANSING, MI.
Sediment Traps in Channels--Design Procedures and Performance,
W79-07804 2J

SOUTHAMPTON UNIV. (ENGLAND). DEPT. OF OCEANOGRAPHY.
The Reproduction Behavior of Gammarus Duebeni (Lilljeborg), and the Inhibitory Effect of a Surface Active Agent,
W79-07672 5C

SOUTHERN CALIFORNIA COASTAL WATER RESEARCH PROJECT EL SEGUNDO.
Vessel-Related Contamination of Southern California Harbours by Copper and Other Metals,
W79-07628 5C

SOUTHERN ILLINOIS UNIV. AT CARBONDALE. DEPT. OF ZOOLOGY.
Black Water and Two Peculiar Types of Stratification in an Organically Loaded Strip-Mine Lake,
W79-07747 2H

SOUTHERN ILLINOIS UNIV., CARBONDALE. DEPT. OF CHEMISTRY AND BIOCHEMISTRY.
Voltammetric Ion Selective Electrode for the Determination of Nitrate,
W79-07586 5A

SOUTHWESTERN GREAT PLAINS RESEARCH CENTER, BUSHLAND, TX.
Irrigated Corn Yield Response to Water,
W79-07793 2I

STATE UNIV. OF NEW YORK AT STONY BROOK. MARINE SCIENCES RESEARCH CENTER.
Field Investigations of the Nature, Degree, and Extent of Turbidity Generated by Open-Water Pipeline Disposal Operations,
W79-07524 5E

STATE UNIV. OF NEW YORK COLL. AT BUFFALO. GREAT LAKES LAB.
Aquatic Disposal Field Investigations Ashtabula River Disposal Site, Ohio, Appendix C, Investigation of Water-Quality and Sediment Parameters,
W79-07525 5C

STATE UNIV. OF NEW YORK COLL. OF ENVIRONMENTAL SCIENCE AND FORESTRY, SYRACUSE. SCHOOL OF BIOLOGY, CHEMISTRY AND ECOLOGY.
Utilization of Soil Invertebrates in Stabilization, Decontamination, and Detoxification of Residual Sludges from Treatment of Wastewater (Interim Report),
W79-07802 5E

SUFFOLK UNIV., BOSTON, MA.
Protecting Massachusetts Wetlands,
W79-07908 6E

SWEDISH WATER AND AIR POLLUTION RESEARCH LAB., GOTEBORG (SWEDEN).
Factors Influencing pH in Lake Water,
W79-07687 5A

TENNESSEE UNIV., KNOXVILLE. DEPT. OF CIVIL ENGINEERING.
The Use of Evapotranspiration as a Means of Wastewater Disposal,
W79-07772 5D

TENNESSEE UNIV., KNOXVILLE. MEMORIAL RESEARCH CENTER AND HOSPITAL.
Transport, Distribution and Toxic Effects of Polychlorinated Biphenyls in Ecosystems: Review,
W79-07688 5C

TENNESSEE VALLEY AUTHORITY, MUSCLE SHOALS, AL. DIV. OF ENVIRONMENTAL PLANNING.
Effects of Thermal Discharge on Aquatic Insects in the Tennessee Valley,
W79-07505 5C

TEXAS A AND M RESEARCH FOUNDATION, COLLEGE STATION.
Final Report on Fate of Metals Applied in Sewage at Land Wastewater Disposal Sites,
W79-07789 5B

TEXAS A AND M UNIV., COLLEGE STATION.
Determination of Average Dry Weights of Important Neuston Species Collected in 1976,
W79-07917 5C

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF BIOLOGY.
Interactive Effects of Salinity, Temperature and Chronic Exposure to Oil on the Survival and Developmental Rate of Embryos of the Estuarine Killifish Fundulus Heteroclitus,
W79-07635 5C

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF OCEANOGRAPHY.
Development of a Chelating/Co-Precipitation Procedure for Matrix-Free Analysis of Various Metals in Organisms from the South Texas OCS by Atomic Absorption Spectrophotometry,
W79-07925 5A

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF VETERINARY ANATOMY.
Addendum to Histopathology of Demersal Fishes. Histopathology of Micropogon Undulatus (Atlantic Croaker) Exposed to Water Soluble Fractions of South Louisiana Crude Oil,
W79-07921 5C

TEXAS DEPT. OF WATER RESOURCES, AUSTIN.
Variations in Specific Yield in the Outcrop of the Carrizo Sand in South Texas as Estimated by Seismic Refraction,
W79-07750 2F

TEXAS UNIV. AT AUSTIN. BUREAU OF ECONOMIC GEOLOGY.
N15/N14 Ratios of Ground-Water Nitrate, Long Island, New York,
W79-07697 5B

TEXAS UNIV. AT AUSTIN. DEPT. OF CIVIL ENGINEERING.
Optimal Design of Culverts under Uncertainties,
W79-07549 2E

TEXAS UNIV. AT AUSTIN. DEPT. OF ENVIRONMENTAL HEALTH ENGINEERING.
Application of Oxygen to Treat Waste from Military Field Installations, Part I. Inactivation of Virus in Bench-Scale Oxygenated Waste Stabilization Ponds,
W79-07809 5D

Application of Oxygen to Treat Waste from Military Field Installations Part II. An Evaluation of an Activated Sludge Process Employing Downflow Bubble Contact Aeration,
W79-07810 5D

TEXAS UNIV. AT AUSTIN, PORT ARANSAS. PORT ARANSAS MARINE LAB.
Analyses of 1975-76 Microzooplankton Samples from Transect II,
W79-07916 5G

Macroinvertebrate Study,
W79-07919 5C

Biomass Measurements of Benthic Invertebrates,
W79-07920 5C

An Intensive Study of the Heavy Hydrocarbons in the Suspended Particulate Matter of Seawater.
W79-07922 5B

Fate of Petroleum-Derived Aromatic Compounds in Seawater Held in Outdoor Tanks,
W79-07923 5C

Development of Mini-Computer Programming to Aid in Interpretation of Mass Spectral Data,
W79-07924 5A

Biological Characterization of the Nepheloid Layer,
W79-07926 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume III - Appendices A-F.
W79-07927 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume IV - Appendices G - I,
W79-07928 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume V - Appendices J - M,
W79-07929 5C

Environmental Studies, South Texas Outer Continental Shelf, Biology and Chemistry. Volume VI - Appendices N - S,
W79-07930 5C

TEXAS UNIV. AT SAN ANTONIO. CENTER FOR APPLIED RESEARCH AND TECHNOLOGY.
The Survival of Human Enteric Viruses in Holding Ponds,
W79-07790 5D

TORONTO UNIV. (ONTARIO). FACULTY OF FORESTRY.
Bioconcentration of Chlordane by the Green Alga Scenedesmus Quadricauda,
W79-07625 5C

TRW DEFENSE AND SPACE SYSTEMS GROUP, REDONDO BEACH, CA.
Destroying Chemical Wastes in Commercial Scale Incinerators. Facility Report Number 3 - Systems Technology,
W79-07871 5D

Destroying Chemical Wastes in Commercial Scale Incinerators. Facility Report Number 1 - The Marquardt Company,
W79-07872 5D

TUDOR ENGINEERING CO., RIVERTON, WY.; AND WYOMING UNIV., LARAMIE. DIV. OF AGRICULTURAL ENGINEERING.
Optimum Lawn Watering Rates for Esthetics and Conservation,
W79-07746 3D

TULANE UNIV., NEW ORLEANS, LA. DEPT. OF BIOLOGY.
Comparison of the Effects of Fourteen-Day and Chronic Exposures to a Polychlorinated Biphenyl, Aroclor 1242, on Molting of the Fiddler Crab, Uca Pugilator,
W79-07662 5C

UNIVERSIDAD NACIONAL AUTONOMA DE MEXICO, MEXICO CITY. CENTRO DE CIENCIAS DEL MAR Y LIMNOLOGIA.
PCBs and Organochlorine Insecticides in Oysters from Coastal Lagoons of the Gulf of Mexico, Mexico,
W79-07630 5C

UNIVERSIDAD SIMON BOLIVAR, CARACAS (VENEZUELA).
Choosing Among Alternative Hydrologic Regression Models,
W79-07763 2E

UNIVERSIDADE FEDERAL DA PARAIBA (BRAZIL).
Cost Analysis of Water and Waste Water Treatment Processes in Developing Countries,
W79-07999 6B

UNIVERSITY COLL. OF NORTH WALES, BANGOR. DEPT. OF BIOCHEMISTRY AND SOIL SCIENCE.
Bacterial Streamer Growth in a Disused Pyrite Mine,
W79-07651 5C

UNIVERSITY COLL. OF SWANSEA (WALES). DEPT. OF BOTANY.
Estuaries,
W79-07722 2L

UPPSALA UNIV. (SWEDEN). INST. OF ZOOLOGY.
Studies on Intraperitoneal Toxicity of Lead to Cichlasoma Nigrofasciatum (Guenther) Development,
W79-07617 5C

Embryotoxicity and Hatchability in Cichlasoma Nigrofasciatum (Guenther) Eggs and Larvae Briefly Exposed to Low Concentrations of Zinc and Copper Ions,
W79-07668 5C

URS/MADIGAN-PRAEGER, INC., NEW YORK.
Analysis of Economic Effects of Water Surface Elevations on U.S. Shoreline of Lake Champlain, New York and Vermont,
W79-07744 6B

UTAH WATER RESEARCH LAB., LOGAN.
Levels of Analysis in Comprehensive River Basin Planning,
W79-07577 6B

Residual Heavy Metal Removal by an Algae-Intermittent Sand Filtration System,
W79-07638 5C

Separation of Algal Cells from Wastewater Lagoon Effluents, Vol. III: Soil Mantle Treatment of Wastewater Stabilization Pond Effluent - Sprinkler Irrigation,
W79-07870 5D

VERMONT UNIV., BURLINGTON. DEPT. OF ZOOLOGY.
Biological Production and Nutrient Studies of Lake Champlain,
W79-07741 2I

VERMONT UNIV. BURLINGTON, RESEARCH ECONOMICS.
A Water Resource Planning Procedure for Rural Towns,
W79-07561 6A

VERSAR, INC., SPRINGFIELD, VA.
Biological Indices in Water Quality Assessment,
W79-07973 5A

VIKRAM UNIV., UJJAIN, (INDIA) SCHOOL OF STUDIES IN ZOOLOGY.
Toxicity of Cadmium Chloride and Lead Nitrate to Chironomus Tentans Larvae,
W79-07606 5C

VIRGINIA COMMISSION OF GAME AND INLAND FISHERIES, CHARLOTTESVILLE.
Fishery Resources of the Shenandoah Valley,
W79-07971 5C

VIRGINIA INST. OF MARINE SCIENCE, GLOUCESTER POINT.
A Field Study of Fluid Mud Dredged Material: Its Physical Nature and Dispersal,
W79-07528 5E

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. CENTER FOR ENVIRONMENTAL STUDIES.
Benthic Macroinvertebrates of the Shenandoah Basin,
W79-07967 5C

Water Quality Efforts by Chemical Industries,
W79-07984 5A

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF AGRICULTURAL ENGINEERING.
A Finite-Element Model of Overland and Channel Flow for Assessing the Hydrologic Impact of Land-Use Change,
W79-07565 4D

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF BIOLOGY.
Evaluating Pollution Stress on Ecosystems,
W79-07516 5A

Future Research Needs,
W79-07517 6A

Opportunities for Maintenance Rehabilitation of Riparian Habitats: Eastern United States,
W79-07518 5C

Survival of Euglena Gracilis Exposed to Sublethal Temperature and Hexavalent Chromium,
W79-07770 5C

VIRGINIA STATE WATER CONTROL BOARD, RICHMOND.
Toxic Substances in Opequon Creek, Virginia,
W79-07975 5B

VSESOYUZNYI NAUCHNO-ISSLEDOVATELSKII INST. VODOSNABZHENIYA, KANALIZATSII, GIDROTEKHNICHESKIKH SOORUZHENII I INZHENERNOI GIDROGEOLOGII, GOSSTROI (USSR).
Waste Water Treatment by Physical and Mechanical Methods,
W79-07813 5D

Employment of Microstrainers in the Waste Water Treatment Practice,
W79-07817 5D

Use of Floatation for Waste Water Treatment,

☆U.S. GOVERNMENT PRINTING OFFICE: 1979-281-061/5

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.

- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

1 NATURE OF WATER

2 WATER CYCLE

3 WATER SUPPLY AUGMENTATION AND CONSERVATION

4 WATER QUANTITY MANAGEMENT AND CONTROL

5 WATER QUALITY MANAGEMENT AND PROTECTION

6 WATER RESOURCES PLANNING

7 RESOURCES DATA

8 ENGINEERING WORKS

9 MANPOWER, GRANTS, AND FACILITIES

10 SCIENTIFIC AND TECHNICAL INFORMATION
